"Talleyrand has hitherto been deemed the author of this Treaty. For the name of that Prince the people of England will feel some little pride in substituting for the future that of the Foreign Secretary of the Whig Cabinet—a man who has never yet deserted a friend to whom he has been attached, or a principle which he has advocated, through a political life of now nearly twenty years. In a season of great excitement, of marvellous changes of doctrine, when many of those who are called statesmen amongst us have felt the necessity, if they were to remain before the public at all, to disavow the tenets of their early years, to alter but yesterday, and even to reverse the notions with which they identified their claims to office so late as only a year ago, the author of the Quadruple Treaty has had no opinion to abandon or even to revise. And yet this is the only man in our Cabinet whom the apostate *Times*, the drivelling *Herald*, the Russian *Gazette of Augsburg*, the misguided *Post*, and the reckless though able *Standard*, have condescended to put down ! 'What then,' asks our antagonist, in his own simple-minded way, 'is to be the ulterior fate of the Quadruple Alliance ?' If the writer in *The Post* will read the Treaty, he will find that its whole design is to create upon the basis of physical strength, reposing at this side of the Pyrenees and the Tagus, a moral control which shall operate beyond them. The intended effect has been already realized in Portugal. We shall soon be in a position to judge how far it is likely to be attended with success in the larger portion of the Peninsula.—*The Post* also asks, 'Are we, for example, to send to the Queen's fleets, arms and stores ?' To this we answer, that ships of war are already in preparation to visit the north-western coasts of Spain, to menace the disaffected, to encourage the timid, to sustain the faithful subjects of the Queen, all of which may be done simply by the firing of a salute. Arms and stores we have sent, and shall continue to send, to Spain, in any quantity that may be reasonably required. We shall adhere to our bond in that respect, and execute it as becomes a people who know the price of freedom."

## THE CURRENCY.

(From the Herald.)

Mr. Cayley's motion on the subject of agricultural distress was brought forward on Monday night, and that of Lord John Russell on the subject of Corporation reform was, as we expected, postponed to a future day. The importance of Mr. Cayley's motion no one can deny, for whatever may be thought of either of the measures which he suggested for its relief, the existence of agricultural distress to a ruinous extent is incontestable, and the necessity of some inquiry undertaken with a view to its relief would seem to be almost a necessary consequence of that admission if the dread of looking difficulties in the face did not operate to prevent it. The motion was, "That a Select Committee (based on the Parliamentary declaration of agricultural distress) be appointed to inquire if there be not effective means within the reach of Parliament to afford substantial relief to the agriculture of the United Kingdom, and especially to recommend to the attention of such Committee the subject of a silver or conjoined standard of silver and gold." By this it will be seen that two questions at least, and each of those including considerations of the greatest moment, were brought under the discussion of the House, namely the state of agriculture and the state of the currency. Whether it was judicious to have thus combined them, we leave to the debate itself to determine, but that a case was made out by Mr. Cayley, as it had been by the Marquis of Chandos, in three several instances before, to call for the interference of the Legislature in behalf of the agricultural interest, may be capable—for what is not capable of dispute?—but cannot be effectually contradicted even by the disingenuous tricks of debate so often resorted to by those who call themselves statesmen. Mr. Cayley well observed, with respect to the depression of agriculture, that "the question was, whether the land should be cultivated?" "Before a Committee of that House it had been shown that it was necessary to have 60s. per quarter for wheat to sustain the average rental of the country, with the cost of cultivation. Since then there had been a descending ratio of prices down to 36s. and 35s.; at which not one-half the arable land of the country could sustain rent." And yet the Reformed Parliament has now, for the fourth time, in the course of the current Session, decided not only against the particular measures suggested for the relief of agriculture, but against all inquiry into the question whether relief be practicable or not.

## THE BRITISH VOLUNTEERS.

(From the Morning Post.)

"We should not wonder soon to see a monument raised to the memory of General Alava, for enabling our chivalrous countrymen to become the Swiss—the mercenaries of a foreign Power. He has opened a new road to the needy and enterprising, upon which they may travel to honours, renown, and fortune. At a moment when the accumulated weight of suffering and disappointment presses heavily on our country; when the miseries of the people continue, and employment is nowhere to be had, the considerate representative of a foreign State humanely steps forward and contracts with Government to take off 10,000 of our surplus population, by conveying them to a land flowing with milk and honey. Such benevolence, such philanthropy, as this cannot go unrewarded. We should, however, advise the 'splendidly equipped

volunteers, to be led by Colonels Evans and Hodges,' to look before they leap, and not trust to all the idle tales invented to entrap them. They are not going to Portugal. They are told that so soon as the Gallo-African legion is landed at Malaga, and 10,000 British volunteers reach Bilboa, 'the war will be probably terminated, without further resistance on the part of Don Carlos, whose position has already become desperate.' Such is the lure actually held out to adventurers on the very day in which information is received that the Bastan is evacuated; that the commanding fortresses in the four provinces are taken or abandoned; that seven hundred Christinos have deserted; and that the army under Valdez is demoralized and weakened to such an extent as to compel that General to seek shelter beyond the Ebro.—This is base and mischievous delusion. The position of Charles V. is brilliant, and it has been rendered so partly by the victories of his gallant adherents, but chiefly by the errors, follies, and crimes of his opponents in power. The Queen-Regent has been *en spectacle* before the Spanish people for more than two years, and they have judged her merits and her alleged rights. Experience has taught them that they can never be at peace under her administration; and thence the extreme party, those who lately supported her, would gladly call into their aid the Constitution of 1812, or that of any of the South American Republics, provided they can escape from the anarchy and degradation into which she has plunged them. They waited only for the *dévolement* of the piece got up by Martinez de la Rosa, which commenced the moment foreign intervention was pronounced necessary. The Government had not dared to avow the fact of foreign aid having been demanded; but every one knew that this was the only course left for the Christinos. In anticipation of the impending crisis, numbers, according to the last accounts were leaving Madrid—all, indeed, who had the means, bankers, Proceres, &c. Resolutions had been adopted in the principal clubs, and handbills issued by them, actually inviting all Spaniards to join the Carlists rather than suffer their soil to be polluted by armed foreigners, on the principle that strangers can never settle the main question at issue, although their presence may for a short time prolong a petticoat Regency, with all its humiliations and debaucheries. Under these circumstances, what kind of reception, we ask, can our deluded countrymen expect in Spain? On every side they will be surrounded by a hostile population, regarding them with an evil eye, and always ready to compass their destruction. They will be considered as mercenaries, incited by no previous provocation, but landed in the country for the mere purposes of outraging and plundering the inhabitants.

## WILLIAM COBBETT.

This powerful and original writer died on Thursday, June 18th, at ten minutes past one p.m., at his farm, in Surrey, aged 73. He retained his faculties till the last moment, and died with perfect composure.

In an account of himself, to be found in the collection of the works of *Peter Porcupine*, Cobbett states that he was born in 1765. As, however, we have derived the above particulars from his family, there can be no doubt of their accuracy; and it would appear, therefore, that he was inaccurately informed as to the particulars of his early life, on his return from America to England in 1801.

Cobbett was a self-taught man in the true sense of the word. His father possessed a small piece of

ground at Farnham, in Surrey, and Cobbett himself was brought up as a common agricultural labourer. In 1783 he quitted his father's roof, and repaired to London, where he succeeded in finding employment in the office of an attorney. Having enlisted as a common soldier, he was sent to Nova Scotia, and attained the rank of Sergeant Major. On the return of the regiment to England, he became involved as prosecutor in a court-martial, but did not await the issue. He left England for France, and sailed from a French port to the United States, where he maintained himself for some time by teaching English to Frenchmen. At that time the French, or democratic party in America, were loud in their abuse of England, and Cobbett was induced to espouse the cause of his mother country. He published a succession of pamphlets, under the assumed name of *Peter Porcupine*, written with great force and vivacity, some of which were reprinted at the time in England. He was convicted of a libel against Dr. Rush, and subjected to heavy damages. In 1801 he returned to England and established a morning paper under the title of *The Porcupine*, in which he warmly supported Mr. Pitt. That paper, however, soon failed, and he soon afterwards set up *The Register*, which has been continued to the present time. Cobbett commenced his career as a public writer in England under very favourable circumstances. He was powerfully patronised by the Ministry. Mr. Wyndham went even so far in the House of Commons as to declare that a statue of gold ought to be erected to him. His health was drunk at Tory dinners throughout the island. His letters on the subject of the Treaty of Amiens produced a great sensation both here and on the Continent. Of this production it was said by the celebrated Swiss historian, Muller, that it was more eloquent than any thing that had appeared since the days of Demosthenes. It is generally understood that Mr. Pitt gave offence in some way to Cobbett; for on his return to power, Cobbett lost no opportunity of attacking his Ministry with great bitterness. Of Mr. Wyndham he long continued to speak favourably, but to him he became also hostile. From a Church and King man, Cobbett became, in 1805, a Radical. In 1810 he was sentenced to two years' imprisonment in Newgate, and a fine of 1,000*l.* From an idea that he would be deprived of his liberty, under an anticipated suspension of the Habeas Corpus Act, he left England for America in 1817, whence he returned when the suspension terminated. It had long been a great object of his ambition to sit in the House of Commons, and after the passing of the Reform Bill he was returned for Oldham, through the influence of Mr. Fielden, an extensive manufacturer at Todmerden. By his death a vacancy takes place for Oldham.

We have merely noticed a few of the incidents in Mr. Cobbett's life. In fact, he has been so continually before the public during the last 40 years, and his *Register* is so complete a record of all that he has said and done—felt and thought, that there is no man, perhaps, of whom so little can be told that would be new to any class of readers.

Cobbett was perhaps the greatest egotist that ever lived: and as every thing that he did, and every sentence that he uttered, was important in his own estimation, he is the constant theme of his voluminous writings.

It would be vain to deny that William Cobbett was one of the most powerful writers that England has ever produced. He felt keenly and observed accurately, and he never failed to make a strong impression on his readers. His last *Register*, published on the 13th inst., is as animated as his first American pamphlet, published in the full tide of

youthful vigour. The wonder is, how a man writing every day for upwards of forty years should never exhibit any symptoms of coldness or indifference, but communicate to his pages a constant interest.

As an advocate he was without an equal. In that first of requisites—the statement of a case—he particularly excelled. He instinctively seized on the circumstances which favoured the views he wished to support, and he seldom failed to produce the impression at which he aimed. What he could not effect by direct statement, he attained by innuendo. He was shrewd beyond most men, and he could detect and expose a subterfuge more successfully than most men. But after all, Cobbett was not a wise man. We question if, in the whole course of his life, he ever set himself seriously down to discover the truth. He was a man of impulses. William Cobbett was the object towards which the thoughts of William Cobbett were constantly directed. Hence the constant changes of opinion, with respect to all subjects and all men. There is not, perhaps, a question which he has not by turns advocated and opposed—there is not a man whom he has not by turns praised and abused. Hazlit supposed this change of opinion was the result of a fickleness of disposition, and that without this fickleness we should also have been without his freshness. It is certain that it was always sufficient to be in the way of William Cobbett to incur his enmity and become the object of his abuse.

As a reasoner, in the proper sense of the word, Cobbett did not rank high. He never saw the whole of a subject, and his views were, therefore, always partial. But give him a special case, and he could make more of it than any man. His illustrations were peculiarly forcible, and whatever he had to describe, he described well. His "*Rural Rides*" contains, perhaps, the very best descriptions of English scenery that ever were written. His descriptions of rural life in Pennsylvania, when he left England in 1817, are also admirable. Being an accurate observer, his language was always graphic. His style was always racy and idiomatic. In his earlier productions he was somewhat declamatory, and indicated a familiarity with French writers. As he advanced in years his language and style became more Saxon.

Though Cobbett upon the whole was a good speaker, he was not a good debater, and therefore was not in his element in the House of Commons. He could get on well enough in a lecture, when he had all the talk to himself; but he could not bear opposition with temper, and he had not a command of resources sufficient for the exigencies of a discussion. What he might have been had he entered Parliament at an earlier period of his life we know not; but he was evidently too old at seventy years of age to cut a figure as a ready speaker. He made one or two good speeches; but he repeated himself, and always made the same speech. To a certain extent, indeed, his *Register* was liable to the same charge of sameness; but his happy illustrations and descriptions made you forget that you had heard the same opinions repeated by him a hundred times before.

He has left a widow and a large family. Two of his sons are at the Bar, and are, we believe, exceedingly well liked. One of them wrote the well-known description of the turning up of the Rats, quoted by *The Quarterly Review* as one of the happiest of Cobbett's effusions.

No man could have occupied the public so constantly with himself as Cobbett has done, without possessing great talents. Take him with all his faults as a writer, and he will still be an extraordinary man.

# THE NORTHAMPTONSHIRE Farming & Grazing Society,

ESTABLISHED 1819, FOR

THE ENCOURAGEMENT OF GOOD PLOUGH-  
ING, GOOD SHEPHERDING,

And for the general good Conduct of Farming Labourers.

PRESIDENT,

C. HILLYARD, Esq., Thorpe-lands, near North-  
ampton.

STEWARDS FOR 1835,

Mr. WILLIAM WATTS, Scaldwell;

Mr. MICHAEL HARRIS, Weston Favell; and

Mr. THOMAS BOSWORTH, Highgate House.

The following **PREMIUMS** are offered by the Society, to be awarded at the Annual Meeting, on Wednesday, Sept. 9, 1835, viz.:

To the ploughman who shall plough, in the best manner, with two horses abreast, and without a driver, half an acre of land within the space of three hours and a half, and not less than four and a half inches deep ..... £2 2 0

To the next best ploughman ..... 1 1 0

To the next ..... 0 10 6

To the farmer of this county, or a farmer's son not exceeding 25 years of age, who shall plough, in the best manner, with two horses abreast, without a driver, and within three hours and a half, half an acre of land, not less than four inches and a half deep, a Silver Cup, given by Sir WILLIAM WAKE, Bart., EDWARD BCUVERIE, Esq., and the President of this Society.

\* \* A ploughman who has in any previous year gained the first prize will not be allowed to plough again for a Prize; nor any ploughman to plough for a prize more than three times. The same regulation will be observed as to labourers, in order that no one shall in the future receive more than the amount of the first prize. Persons intending to send teams, to give notice to the Secretary, on or before the Saturday preceding the day of show. The teams of those who fail to do so will not be permitted to plough. To prove the skill of the ploughmen, each ploughman is to put on his own plough irons on the ground, before starting for the prize.

To the shepherd (whose master is a member of this society), who shall rear, to the 4th of May, the greatest number of lambs, in proportion to the number of ewes put to the tup on the farm; the number of ewes to be not less than four score ..... £2 2 0

To the shepherd, who shall rear the next greatest number ..... 1 1 0

To the next ..... 0 10 6

\* \* Certificates as follows, to be signed by the master, to be sent (if by letter, post paid), to the President, Treasurer, or Secretary, on or before the first Saturday in July:—

*"I do hereby declare that the whole number of ewes I put to the tup in the autumn of 1834, did not exceed \_\_\_\_\_, from which said number of ewes my shepherd, \_\_\_\_\_, has raised to the 4th of May, \_\_\_\_\_ lambs."*

To the unmarried man, who has lived in the house of a member of this society, or the former occupier of the same farm, the longest time without intermission, and is now living there as a farming servant ..... £2 2 0

To the unmarried woman, who has lived with a member of this society, or with a former occupier of the same farm, the longest time without intermission, and is now living there, doing the work of a farm-house ..... 2 2 0

To the labourer of a member of this society who has been, and is now employed entirely in husbandry, without intermission, (by illness excepted), the longest time in the same service or on the same farm ..... 2 2 0

To the labourer who has served the next longest time ..... 1 1 0

To the next ..... 0 10 6

To the labourer employed entirely in husbandry, by a member of this society, and who is now supporting by his labour the greatest number of children, but not less than four, under 12 years of age, without having received parochial aid (illness excepted), or having property to the amount of ten pounds or upwards, exclusive of his household goods ..... 3 3 0

To the labourer supporting the next greatest number of children, not less than three, under the circumstances as before mentioned ..... 2 2 0

To the next, with not less than two ..... 1 1 0

Offered by EARL EUSTON.—To the labourer in the county, whether employed by a member of the society or not, but who has been employed entirely in husbandry, and who is now supporting by his labour the greatest number of children, but not less than four, under 12 years of age, without having received parochial aid (illness excepted), or having property to the amount of ten pounds or upwards, exclusive of his household goods ..... 3 3 0

Offered by JOHN PERCIVAL, Esq.—To the labourer supporting the next greatest number of children, not less than three ..... 2 2 0

To the next, with not less than two ..... 1 1 0

Offered by SAMUEL PERCIVAL, Esq.—To the youth, under 20 years of age, that has been the longest time employed entirely in husbandry, by the same master, or on the same farm, in this county 1 1 0

To the youth, under 20 years of age, who has lived in the house the longest time with the same master, in this county, and employed entirely in husbandry ..... 1 1 0

The prizes to ploughmen, shepherds, and labourers, to be received at the Mercury Printing Office, the Saturday after the annual meeting.

\* \* Certificates, signed by the master, and overseers of the poor of the parish, to be sent to the treasurer or secretary (if by letter, post paid), on or before the 1st of September, stating if they have previously received any money from this society. Certificates from those masters whose subscriptions are in arrear cannot be received.

## FORMS OF CERTIFICATES FOR THE ABOVE PREMIUMS.

This certifies that A. B. a single man, has lived with me and been employed entirely in husbandry, \_\_\_\_\_ years, without intermission.

(Signed) E \_\_\_\_\_, master.

F \_\_\_\_\_, } Overseers of the  
G \_\_\_\_\_, } parish of \_\_\_\_\_.

This certifies that A. B. has been employed by me entirely in husbandry, \_\_\_\_\_ years, without intermission. Signed and witnessed as above.

This certifies that A. B. of C., and now employed by me entirely in husbandry, is now supporting \_\_\_\_\_ children, under 12 years of age, without ever having received parochial aid, illness excepted. Signed and witnessed as above.

To a resident of the county who shall exhibit the best boar, worthy of a premium, under two years old, his own property, and that is intended to be used in the county ..... 2 2 0

Subscriptions due each year on the 4th of May, to be paid to the treasurer or to the secretary, on or before the annual meeting; and the se-

cretary will attend at the show and the ordinary for the purpose of receiving such subscriptions and arrears as may not have previously been paid. All persons elected members of this society, will be considered as such until they have given a notice of resignation to the secretary of the society.

#### THE FOLLOWING PRIZES ARE OFFERED BY MEMBERS OF THIS SOCIETY:—

[All animals intended to be shown for prizes or sweepstakes to be at Earl Spencer's farm, at Brampton, on Tuesday morning, September 8th, by 11 o'clock, at which time the judges will enter upon their office.—Extra stock to be at Brampton by nine o'clock on Wednesday morning; at ten o'clock all the animals will be exhibited for public inspection; and at one o'clock the awards will be made known.—None of the animals to be removed from the show-ground till after two o'clock.]

BY EARL SPENCER.

1st. To the owner of the best fat ox or steer (quality and age as well as weight to be taken into consideration), weighing not less than 90 stone of 14lbs and that has not had from the 1st of January, 1835, to the 1st of August, either cake, corn, linseed, meal, oil, or grains..... 10 0 0

2d. To the occupier of land of the county, who produces the best fat ox or steer (quality and age as well as weight to be taken into consideration), weighing not less than 70 stone, nor above 90; that has been in the county from the 4th of May, 1835, and that has not had from the 1st January either cake, corn, linseed, meal, oil or grains 7 0 0

To the owner of the second-best beast shown for the above prize ..... 3 0 0

*By* In consequence of a late Act of Parliament weights will be computed by the stone of 14lbs instead of 8lbs as heretofore.

3rd. To the occupier of land in the county, who produces the best fat cow or heifer, (quality as well as weight to be taken into consideration) that has been in the county from the 4th of May, 1835 ..... 7 0 0

To the owner of the second-best beast shown for the above prize ..... 3 0 0

4th. To the owner of the best pen of five long-woolled ewes, which have reared lambs in the county in the year 1835, and which are intended to be bred from in the next year. The ewes are to be taken from a regular store breeding flock; they are not to have had their lambs weaned, or themselves to have been separated from the rest of the flock of ewes previous to the 30th of June, 1835. They must have been in the possession of the person who shows them from the 1st of January, 1835, and not had from that time either cake, corn, linseed, or meal..... 7 0 0

To the owner of the second-best pen.... 3 0 0

5th. To the owner of the best pen of five long-woolled theaves, bred by himself in the county, and kept therein, and which have never had either cake, corn, linseed, or meal..... 7 0 0

To the owner of the second-best pen.... 3 0 0

6th. To the owner of the best pen of five long-woolled shearhogs, bred by himself in the county, and kept therein, and which have never had either cake, corn, linseed, or meal..... 7 0 0

To the owner of the second-best pen.... 3 0 0

\* Persons who have let in the preceding or present years five or more tups, not to show for the above prizes for ewes or theaves.

7th. To the owner of the best shearling long-woolled tup, bred in the county, and kept therein, without ever having had either cake, corn, linseed, or meal ..... 10 0 0

8th. To the occupier of land in the county, who produces the best long-woolled tup, of any age, either his own property, or that he has exclusively hired to be kept in the county during the season 10 0 0  
Mr. Dent, of Milton, adds two sovereigns to this prize

9th. To the occupier of land in the county, who shall send to Earl Spencer's farm at Brampton, before noon on Tuesday, September 8th, the best sample of not less than four bushels of wheat, thrashed out from a crop produced in the county in 1835 ..... 3 0 0

10th. To the occupier of land in the county who shall send the best sample of not less than four bushels of barley, the produce of the county in 1835 ..... 3 0 0

11th. To the occupier of land in the county who shall send the best sample of not than four bushels of oats, the produce of the county in 1835 ..... 3 0 0

12th. To the person who shall shear a sheep in the neatest and most skilful manner, at Earl Spencer's farm at Brampton, on Tuesday the 23rd June, 1835 ..... 7 0 0

To the next best ..... 5 0 0

To the next ..... 3 0 0

Candidates for the above prizes to be at Brampton by nine o'clock in the morning. Shearing to commence at ten.

13th. To the labourer in husbandry of any county, who shall, at Earl Spencer's farm at Brampton, on Wednesday the 23d December, 1835, cut, lay, and ditch, in the most workmanlike manner, 11 yards of hedge-row..... 10 0 0

Competitors for the above prize to send in their names to the secretary on or before Saturday the 19th December. No one can compete for the prize whose name is not so sent in.

14th. To the owner of the best cart stallion, to be exhibited at Althorp Park, on Friday the 4th day of March, 1836 ..... 10 0 0

The horses to be exhibited for this prize must be brought to the stables, at Althorp, at nine o'clock in the morning of that day.

The prize will be declared when the horses are exhibited on the market place, Northampton, on the following day, at twelve o'clock at noon.

The condition on which this prize will be given is, that the horse which shall be declared to be the best shall serve mares one day in the week during the season, at Northampton, at a price not exceeding thirty shillings each mare. The prize will be given to the exhibitor at the annual meeting in September, on a certificate being produced to this effect.

BY LORD SONDÉS.

To the occupier of land in the county of Northampton, who shows the best fat ox or steer, under 70 stone (quality as well as weight to be taken into consideration,) that has been in the county from 20th February, 1835, and that has not had since that time either cake, corn, linseed, meal, or grains, and grazed from the 10th May, without hay or roots, to the time of showing ..... 5 0 0

To the occupier of land in the county, who shows the best fat cow or heifer, being neither marten nor spay, if worthy of a premium (quality as well as weight to be taken into consideration,) to be in the possession of the person who shows it from the 20th February, 1835, and has not had since that time either cake, corn, linseed, meal, or grains, and grazed from the 10th of May to the time of showing without hay or roots ..... 5 0 0

BY SIR J. H. PALMER, BART.

To the occupier of land in the county, who shows the

best pair of open heifers of any breed (crosses excepted,) the value to the butcher not to be taken into consideration, and not to exceed two years old, and that has never had after 8 months old, linseed, cake, corn, meal, or milk 5 0 0

BY THE HON. E. S. PERY.

For the best beast of any kind, exhibited as extra stock, age, quality, and feeding to be taken into consideration ..... 5 0 0 which sum is to go to the society's fund, should the judges be of opinion that there was no animal of sufficient merit shown to have the prize awarded. The feeding and age to be specified and sent, with the beast, to Brampton, on Wednesday morning by nine o'clock.

To the owner of the best pen of five longwoolled shearhogs, bred in the county by the same person —no restriction as to keep ..... 5 0 0

BY STAFFORD O'BRIEN, ESQ.

For the best bull, that has been exclusively used in the county for the last twelve months, or that is intended to be used in the county for the next twelve months ..... 5 5 0 No bull will be allowed to be shown for the prize that is not brought to the show with a ring in his nose, and properly secured.

BY SIR FRANCIS LAWLEY, BART.

To the owner of the most valuable two-year-old colt, bred either in the counties of Northampton or Warwick, by a person who is not an owner of more than five hundred acres of land .. 10 0 0

BY E. BOUVIERE, ESQ.

To the tenant, occupier of land in the county, being a member of this society, who can show about the first week in November, the cleanest and best crop of not less than five acres, of Swedish turnips, on old tillage land which has the preceding year borne a crop of white grain ..... 5 0 0 Persons who intend to show for this premium, to give notice to the president or secretary on or before the first of October.

\* Entries must be made, and certificates, according to the underneath form, must be sent for all stock intended to be shown for the above prizes, or underneath sweepstakes, to the Mercury Printing Office, or to the secretary, not later than the Saturday preceding the day of the show; and any person proved to have intentionally sent in a false certificate, will not again be permitted to exhibit any animal at any future show; and if a member of the society, his name will be struck out of the list. No individual to be allowed to make more than one entry for each prize, or to enter any beast for two prizes, or to enter any one which has been shown for the same prize in a former year; or to enter any sheep in the same class where it has gained a prize in any former year.

It is expected that the arrears of subscriptions shall be paid before the prizes are awarded to any member's stock, servants, or labourers.

FORM OF CERTIFICATE.

I do hereby declare that the (ox, steer, cow or heifer, as it may be,) which I intend showing for Earl Spencer's prize, No. , or Lord Sondes's, or Sir J. H. Palmer's, or the Hon. E. S. Pery's (or sweepstakes, No. , or both, as it may be,) is old, was bred by (if breeder known,) and fed by me, and is in every respect duly qualified according to the condition specified for prize No. or sweepstakes, No. (or both as it may be.) Witness my hand, this day of August, 1835. Name, —. Place of abode, —.

Certificates for sheep to be in the same kind of

form, but to mention by whose tup the theaves and shearhogs exhibited were by.

The judges not to award any premium if the animal or animals exhibited for it have not in their judgment sufficient merit. If they should have any reasonable doubt as to the weight of a beast, not to exclude it from the prize if it does not exceed, or should appear to be under one-twentieth part of the prescribed weights.—No animal to be excluded from being shown for any prize or sweepstakes, if it should exceed, or be under, the prescribed age, fourteen days.

A public ordinary at the George Hotel, Northampton, at four o'clock. A meeting of the members will be held there immediately on returning from Brampton, to transact business before dinner.

Written communications on agricultural subjects will be acceptable to be read at the meeting, either by the president or by the writers of them. New agricultural implements exhibited at the show will be attended to, and noticed, if deserving.

Wool fair the first Saturday in July. The ordinary at the George Hotel, at two o'clock.

These printed papers may be had at the Mercury Printing Office, or at the Secretary's, Northampton; of Messrs. Hill and Son, agents, 17, West Smithfield; and of Messrs. Cormack's, Bedford Conservatory, Covent Garden, London.

T. E. DICEY, Esq. Parade, Northampton, Treasurer. C. GOODMAN, Drapery, Northampton, Secretary.

### THE FOLLOWING SWEEPSTAKES

Are open, to be decided at the annual meeting of the Northamptonshire Farming and Grazing Society, in September, 1835, by the judges appointed to decide on the stock shown for the prizes offered by Earl Spencer, age and quality to be taken into consideration.—All the stakes to close on 31st August, if not otherwise expressed.—Those marked thus \* not confined to the county.—The ages of the animals to be computed to the day of showing. Stakes to be paid to the treasurer on or before the Saturday preceding the show, or at latest at the show at Brampton.—In consequence of a late Act of Parliament weights will be computed by the stone of 14 lbs., instead of 8 lbs., as heretofore.

Any persons wishing to have their names added to any of the stakes, or to open any fresh one for any kind of stock, will please to give notice either to the President of the society, C. HILLYARD, Esq., Thorpeland; or to the Treasurer or Secretary.

\* No. 1. A sweepstakes of five sovereigns each. for the best ox, under five years old, fed without restriction.—Spencer.

\* 2. A sweepstakes of three sovereigns each, for the best ox or steer, which shall qualified for the 2nd class in the Christmas Smithfield show, 1835; to be in the possession of the person who shows it before the 4th May.—Spencer. Geo. Peach. J. Beasley.

\* 3 A sweepstakes of three sovereigns each for the best steer, not exceeding three years and nine months old, and not weighing more than 70 stone, that has been in the possession of the person who shows it from the first of January, and has not had since that time cake, corn, linseed, meal, or grains, nor since the 10th May has had anything but grass. Quality as well as weight to be taken into consideration.

\* 4. A sweepstakes of three sovereigns each, for the best beast shown for Earl Spencer's prize (No. 1) for a fat ox.—Spencer. Geo. Peach. J. Beasley.

5. A sweepstakes of two sovereigns each, for the best beast shown for Lord Spencer's prize (No. 2) for a fat ox.—W. Wake.

- \* 6. A sweepstakes of three sovereigns each, for the best pair of steers, of any breed, under four years old, age and quality to be taken into consideration, to be in the possession of the person who shows them on or before the 20th of February, and not had since that time either cake, corn, linseed, meal, or grains.—W. Wake. Spencer.
7. A sweepstakes of two sovereigns each, for the best pair of Hereford steers, fed in the county, under four years old, age and quality to be taken into consideration, that have been in the possession of the person who shows them from the 20th of Feb. that have not had since that time either cake, corn, linseed, meal, or grains.—W. Wake.
8. A sweepstakes of one sov. each, for the best pair of Hereford steers, under three years and a half old, and not exceeding 60 stone that have been in the county from the 20th of February, and have not had either cake, corn, linseed, meal, grains, or milk, after six months old, and nothing but grass from the 10th May.—C. Hillyard.
- \* 9. A sweepstakes of three sovereigns each, for the best steer of any breed, under four years old, that has been laying out at grass from the 10th May, and that has not had, after six months old, cake, corn, linseed, meal, milk, or grains.
10. A sweepstakes of one sovereign each, for the best beast exhibited for Earl Spencer's prize for a fat cow or heifer.—Geo. Peach.
11. A sweepstakes of two sovereigns each, for the best steer, not exceeding four years old, or 70 stone, that has been in the county not before the 1st of October or later than the 20th February, that has not had from the 1st January, either cake, corn, linseed, meal, malt dust, or grains, and has had nothing but grass from the 10th May.
12. A sweepstakes of one sovereign for the best Durham steer, not exceeding three years and nine months old, age and quality to be taken into consideration, which has been in the county from the 1st January, and not had since that time either cake, corn, meal, linseed, or grains, has laid out, and had nothing but grass, from the 10th May.—C. Hillyard. Spencer.
13. A sweepstake of one sovereign, for the best pair of Hereford steers not exceeding two years and a half old, that have been in the possession of the person who shows them from the 1st January, and that have not had since that time either cake, corn, linseed, meal, or grains, and that have laid out, and had nothing but grass, from the 10th May.—C. Hillyard.
14. A sweepstake of one sovereign, for the best steer under two years old, that has been in the county from the first January, and has not had since that time either cake, corn, meal, milk, linseed, or grains, and has laid out, and had nothing but grass, from the 10th May.—C. Hillyard.
15. A sweepstakes of one sovereign, for the best Durham steer, bred in the county, and that has never had, since eight months old, either cake, corn, linseed meal, grain, or milk.—J. H. Palmer.
16. A sweepstakes of one sovereign, for the best open heifer not exceeding 60 stone, and that has never had, after eight months old, either cake, corn, linseed, meal, grains, or milk.—J. H. Palmer.
17. A sweepstakes of five sovereigns each, with two sovereigns added by Mr. Dent, of Milton, for the best bull which has served 25 cows, to be the property of the exhibitor.—To close the 10th May.—John Price. Thomas Beesley. R. W. Baker. John Wetherell, jun. Francis Lawley. William Hanbury.
18. A sweepstakes of one sovereign each, for the best beast shown for Lord Sondes's prize for a fat ox.—W. Wake.
19. A sweepstakes of one sovereign each, for the best beast shown for Lord Sondes's prize for a fat cow.—Jas. Rice.
- \* 20. A sweepstakes of five sovereigns each, for the best breeding cow in calf: value to the butcher not to be taken into consideration. To close on the 18th of August.—John Wetherell, jun.
- \* 21. A sweepstakes of three sovereigns each, for the best cow or open heifer, that has never had after six months old either cake, corn, linseed, meal, or milk, and had nothing but grass from the 10th of May.—Jas. Rice.
- \* 22. A sweepstakes of two sovereigns each, for the best pair of open heifers, under two years old, bred by and the property of the exhibitor, to have had neither cake, corn, linseed, meal, grains, nor milk, after eight months old. To close 18th August.
- \* 23. A sweepstakes of three sovereigns each, for the best pair of Scots, fed without cake, corn, linseed, or meal, and that have been in the possession of the person who shows them from the 20th of February.
24. A sweepstakes of five sovereigns for the best shearing tup, bred by a person in the county, who has not in any one year let out to hire five or more tups.
- \* 25. A sweepstakes of five sovereigns each, for the best tup of any age. Open to all England to the 18th August.
- \* 26. A sweepstakes of five sovereigns each, for the best shearing tup, that has never had either cake, corn, linseed, meal, or any artificial food. Open to all England to the 18th August.—Richard Garratt.
27. A sweepstakes of one sovereign each, for the best ewes exhibited for Earl Spencer's Prize. To close on the 18th August.—G. Hillyard.
28. A sweepstakes of one sovereign each, for the best theaves exhibited for Earl Spencer's Prize. To close on the 18th August.—C. Hillyard.
29. A sweepstakes of one sovereign each, for the best shearhogs shown for Earl Spencer's prize.
30. A sweepstakes of one sovereign each, for the best five whether sheep, fed on grass only.
31. A sweepstakes of two sovereigns each, for the heaviest crop of mangel wurzel, of not less than three acres, on old tillage land after a crop of white grain. Average weight of the crop to be taken the latter end of October. To close on the 1st August.—Spencer. C. Hillyard.
32. A sweepstakes of two sovereigns each, for the heaviest crop, of not less than five acres, of Swedish turnips, on old tillage land, after a crop of white grain. The average weight of the whole crop to be ascertained about the first week in November, by the Judges chosen at the Annual Meeting in September. To close on the 1st August.—Spencer. C. Hillyard.
33. A sweepstakes, for tenant farmers, of one sovereign each, for the best crop, from three to five acres, of swedish turnips, on old tillage land, after a crop of white grain. To close on the 1st of August.—James Rice.
- Match.—For three sovereigns each, a Northamptonshire farmer, under 21 years of age, against a Rutlandshire farmer of the same age, to plough half an acre of land, at Brampton and at Cottesmore.

COMET.

[Vol. III.

## COMET.

No. 155, IN THE HERD BOOK.

Red and white roan, calved in 1804, bred by Mr. C. Colling, got by Favourite, d. (young Phoenix,) by Favourite, g. d. (Phoenix,) Foljambe gr. g. d. (Favourite,) bred by Mr. R. Alcock's bull, gr. gr. g. d. by Mr. Jacob Smith's bull, gr. gr. g. d. by Mr. Jolly's bull. Comet died in 1815, was sold for 1,000 guineas, and 1,500 was afterwards offered for him.

## TO THE EDITOR OF THE "FARMER'S MAGAZINE."

Attemper'd suns arise  
Sweet beam'd, and shedding oft thro' lucid clouds  
A pleasing calm; while broad, and brown, below,  
Extensive harvests hang the heavy head.  
Rich, silent, deep, they stand; for not a gae  
Rolls its bright billows o'er the bending plain:  
A calm of plenty! ——— THOMPSON.

SIR,—Thus has the above beautiful poet sung the bountiful provision of a beneficent Providence, at this season of the year when the toil and industry of the husbandman is blessed to him. At this time the various anxieties of the farmer, peculiar to each other season of the year, are concentrated to the attainment of the object to which all his operations have been directed,—namely, his "Harvest Home." It may truly be said that this is a matter in the success of which all have a common feeling, and it would be a difficult task to find any other object possessing the like deep and general interest which the harvest commands. Could the state of the weather and the yielding of the crops be reduced at this time to matters of certainty, this universal anxiety would, no doubt, considerably subside, and instead of being thought of as a subject of the deepest interest, as the harvest now is, it would be accepted as a matter of course.

He who promised a "seed-time and a harvest," does indeed abundantly fulfil that promise; and experience illustrates to my mind, that the chance of securing corn in good condition, is created by the injurious hurry of the farmer, whereas less haste on his part would nine times in ten reward him with success. I know to an anxious mind, to wait another "day or two," (when the corn has reached that particular state of maturity—when to say the least of it, it is become a questionable matter if it be not fit for the barn, or at all events for the rick), requires no

small share of self-restraint; but at the same time, I have constantly observed that those who have had most patience to endure, have always the best chance of a dry sample.

As regards the present prospect of the crop—like seasons in general—that prospect differs in various situations and soils,—very rarely, if ever, is the weather alike suited to the relative circumstances of our several agricultural districts. The summer of 1832 was certainly an exception from this principle. In that delightful and genial season, *every* thing appeared to flourish, on *every* soil; and although it was the time at which the price of wheat began to decline, and so far, certainly not attended with any pleasant reflection, still it will always be remembered as a year in which it pleased Providence especially to bless, and wonderfully increase the produce of the earth.

The wheat on the whole—as far as my observation extends—appears to be decidedly a good crop. On the good and on wet stiff land, the promise is beyond an average produce; but on the poorer light soils and shraives, there is undoubtedly a deficiency. On this last description of land, the summers since 1832 have been too dry, inasmuch as the growth of corn is concerned, and consequently the falling off of the bulk of straw for the last three years' begins now to have a perceptible effect on the quantity of manure bestowed on the land. The forward sown barley and oats are looking better certainly than could be expected from the extreme dryness of the weather; but the late sown Lent corn bears but a miserable appearance; and indeed the Spring corn for the last three years, which has been sown as late as the first week in May, has barely produced in the growth of the three years, one average crop of grain. The turnip crop of last year having been a plentiful one, and the winter so favourable for the feeding off the turnip with sheep, is of course vastly in favour of the early sown barley and oats, and may perhaps be the chief reason of the present appearance of that crop being better than circumstances appear to warrant; but, however, judging from past events, the probability is, that the present dry summer will not fail to produce its due effect even on the early sown barley and oats, and the result will be, we shall find these crops deficient both in quantity and quality, and the like cause will also operate injuriously to the pulse crops, which are not very strong or healthy.

The young rape and turnip, particularly the forward sown, have suffered from the ravages of the fly, and in many instances it has been necessary to repeat the sowing. The crop of hay throughout this county is very limited, and this deficiency, together with the fact of there being but little saved over from last year, will no doubt cause hay to be unusually dear during the ensuing winter. The harvest here will, I think, become general in the last week of this month, and if there were the like prospect of a fair price for the wheat that there is for a good crop of this "main staff"

of life, an immense deal of trouble would, I apprehend, be spared to the farmer, which he will now experience in making a price for labour during the harvest, and which must undoubtedly be done at a much lower rate than it has been the practice to give for many years past. The reduction of wages, like the reduction of the rent of land to the standard value of both—namely, the price of the bushel of wheat—is a difficult matter to effect in anything like an exact ratio; and even where rents and labour be paid at a corn-rent, difficulties are found to arise beyond the ingenuity of man, which occasionally operate unfairly either on one interest or the other. Use becomes second nature, and where a landowner has been in the habit of receiving £1,000 a-year as the rent of his estate, a farmer of realizing £200 or £300 per annum as the profit of his farm, or a labourer of earning eleven shillings a week, and seven or eight pounds for his harvest month; in either case there is a natural reluctance to submit to a reduction of income, although the standard value to the chief necessities of life may be considerably reduced in price. The secret I believe to be this—that in each of the above gradations of society, certain luxuries or superfluities have become almost essential to the comforts of life, the cost of which is not materially altered either by a rise or fall in the price of wheat, and consequently a reduction of income in proportion to the reduced price of this commodity, which is the first necessary, but which had not the effect of lowering the price of luxuries to a like scale, would be the cause of less of these superfluities being within reach.

It is a hard task for a nation—as a people—to become less luxurious in their manner of living than they have for years been accustomed to; but it is a much more difficult matter to induce, or even to compel any portion or particular class of that society to relax in their accustomed wants and expenses, when the remaining part of the society immediately around them, are not only enabled to continue their former manner of living, but perhaps even to increase their expenses, in being afforded additional means by the selfsame cause which is operating to the destruction of the declining interest. Thus do circumstances at the present moment depress that part of the community immediately depending on the land, and at the same time these very circumstances operate with a counter effect on certain other interests of the country. The conviction of this fact constantly presenting itself to the mind, it is truly heart-sickening to the farmer to observe, not only the indifferent, but the opposing spirit of the present House of Commons to all relief proposed for the agriculturist. It surely would not have been too great a boon to have exempted lime for manure from turnpike toll, as proposed by Mr. Lawson as an amendment of a clause in the “Manure-toll Exemption Bill,” and tiles for draining, as proposed as an amendment to the same bill by Mr. Halford in the House of Commons on Thursday the 9th inst.; however both these amendments our legislators thought proper to reject.

An incendiary fire occurred at the extreme western part of this county, at the beginning of the present month, which destroyed more than twenty loads of wheat, with a double barn, out-buildings, &c. &c. Persons who are not acquainted with the real state of things in this respect, are apt to imagine that these fires are usually the work of some half-starved and oppressed pauper, to revenge an injury received from some tyrannical parish officer, or oppressive and overbearing master. The truth is really the reverse of this, and the several fires which have happened in this neighbourhood on almost every occasion, if the conviction of the offender has not fol-

lowed, suspicion has been attached to persons very far removed from the distress which would in any degree justify such a proceeding. Let me not be here misunderstood: I am quite aware that an incendiary cannot be justified in his diabolical purpose; but at the same time, if I was about to witness execution on two persons, condemned for this crime, the one excited to the commission of the offence by imminent distress, occasioned more by the relentless inhumanity of a hard task-master, or from the unfeeling conduct of a cruel parish officer, than from any misconduct of his own; while the other proceeded from a malicious temper, or from a spirit restless of that controul which the situation of one man fairly gives him the right to exercise over the conduct of another, both for the protection of his own property, and for the good of society in general,—I must confess that I should feel a far deeper regret for the fate of the former than for the latter. But, however contradictory it may appear, the latter is generally the character of the incendiary; at least in this county such has been the case; the fires have not proceeded from *oppressed and half-starved paupers*, but from the *maliciously disposed and dissatisfied labourers*, being in the receipt of good wages, but who have happened to have some dispute with their masters. The recent fire which I have mentioned above, fully bears out this view of the matter. Here the individual whose property has been destroyed, is a highly respectable man, and a considerate and humane master. The delinquent, who is committed for trial for the offence, is a labourer in his employ, and in his master's confidence too, as a sort of foreman; and last year received for himself and a boy or two, seventy pounds in money, besides those little perquisites and favours a man in his situation is sure to enjoy. I know it would be a difficult undertaking to satisfy persons entirely unconnected with country life of the correctness of my views, both as regards the character and motives of action to the crime—of those who commit the vile deed of incendiarism—because a false notion has so long existed on the subject. To such persons rural riots and rick-burnings are synonymous terms with oppression and starvation; they think the employment on these occasions of that gentleman, cypleped Jack Ketch, a national disgrace, and at the same time deplore his exemption duty in case of forgery, &c. &c. as a national misfortune. One would be inclined to think these good people may have extensive effects in the hands of their bankers, but that they are not troubled with farm buildings and stack-yards.

I have a design in contemplation, which I hope before long, through the instrumentality of your pages, to carry into effect, viz.—to give the name, together with the circumstances of the case of every criminal who has been convicted either in this county or in Kent for the crime of incendiarism, since the year 1830.

I am sir,

Your obedient and very humble servant,  
AGRICULTOR.

Sussex, July 15, 1835.

## ON SOILING.

BY MARTIN DOYLE.

(From the Irish Farmer's Magazine.)

Although a free range of pasture is essential to the health of young bullocks, heifers, colts, and fillies, and above all to sheep, there can be no advantage under any circumstances in leaving them exposed to the rays of a broiling sun; during the heat of summer all these animals are much more comfortably

as well as more profitably kept in shade on green food. As to cattle employed in farm or in any other work, and milch and fattening cows, there can be no doubt of the advantages derivable from the steady practice of the soiling system, both by day and night.

I have over and over again admitted that a single cow on good pasture and in favourable weather, will yield more milk if at liberty than when in a state of confinement, even on the most succulent food: but at the same time maintained, that a given portion of land under green crops for cattle-feeding, will maintain a much greater number of cows, and, on the balance of accounts, supply a much greater quantity of milk than under the wasteful grazing system—experience has not led me to alter my opinion. I have no doubt that two acres of good heavy clover will keep eight or ten milch cows during the summer, especially if there be a small supply of vetches to come in between the first and second crops of clover to meet an obvious want, and at the same time afford a desirable change of food. If regular sheds be not in sufficient number, boughs of trees resting on stakes driven into the ground, and rudely thatched with straw or heath, or coarse sour grass cut from ditches and other waste places, will form a ready and sufficient substitute. An ass and well-constructed cart, filled as occasion may require with clover from the field, with a single man to attend, will enable the farmer to feed fifteen or twenty head of cattle; and even if the clover fields (as must periodically be the case where a proper rotation is observed) be at a considerable distance from the farm yard, the time occupied in bringing the clover or vetches to the cows, will not be much more than that occupied in driving them, morning and evening, to and from their milking places. In the neighbourhood of towns, where great dairies are required, and whence manure is easily obtained, soiling is especially advantageous; for in those places land is of considerable value, and there it becomes a great object with the dairymen to obtain the greatest possible quantity of succulent food from the least portion of surface; and as agricultural skill advances, we find that the practice of soiling is pursued as the most fertilizing and beneficial. And if this system be found the most favourable in situations where rich manures are most easily obtained, I think we may reasonably conclude, that it must be much more desirable to adopt the same practice in those districts where such manures are not to be purchased, and where consequently, if they are to be applied at all, they must be created on the spot.

The advantages of soiling are, indeed, so satisfactorily proved by experience, that the threadbare objections of—"cows not yielding milk," and "thriving well"—"the trouble of constantly mowing," &c. &c., are all frivolous and false. I admit that one great difficulty sometimes exists—the want of straw, or other suitable litter; but this obstacle, though a very important one as regards the economy of manure, can only affect the farmer at the commencement of the system: for after the first year or two of steady house-feeding three of his cattle, he will have, through the means of manure supplied by those cattle, such an increased quantity of corn crops as will meet all future demands for litter. If he can purchase straw at first starting, let him do so—it will amply repay him; if not, let him contrive some substitute—dry sand, if he be near the sea shore, will be an excellent receiver of the droppings of his cattle.

It is no uncommon matter in Ireland, to see a superabundance of straw—in those districts where the abundance of lime, and the practice of fallowing,

enable the farmer to raise large corn crops—and this in winter and spring, profusely scattered in lanes and high-ways, or thrown into pools, in order to be rendered rotten by the weather, with little advantage from the cattle, except their occasional trampling over it. Many men who call themselves farmers, thus misapply their straw in winter, instead of keeping it over for bedding down their cattle in the ensuing summer, when the poor animals are starving on worn-out and over-stocked pastures, while all the juices of the meadow grasses are allowed to escape in evaporation before they are converted into hay;—were these grasses to be given in a succulent state, the quantity of land required for the support of a given stock, would be much smaller than is usually imagined.

I prefer clover as a general soiling crop, because almost all land, if in heart and clean, is suited to it. Lucerne, on appropriate soil, is an earlier and more desirable food; but on an average of soils, clover is by far the most advantageous, and the heaviest in proportion to the quantity of land which it occupies. A rich clover crop is invaluable: and when the farmer takes care to have other green food (vetches, lucerne, meadow grasses, &c. &c.) for use during the cuttings of the clover—and earlier and later in the season—he will not revert to the old and unprofitable grazing system; a regular succession and variety of succulent food, should be his object.

Where dairies are kept on a large scale, an incredible number of pigs may be supported by clover (cut and brought to the yards) and almost fattened, if this be washed down with buttermilk. Three hundred pigs have been kept on a single farm in this way, and often without the accompaniment of the buttermilk. But too many of us while we preach about the advantages of soiling, neglect the practice of it. I hardly know any person in my neighbourhood who practices soiling, on any thing approaching to a large scale. I have, however, one exceedingly good example to adduce—that of John Lloyd, Esq. of Ballycogley, (about twenty miles from my farm of Ballyorley) who furnishes a complete practical proof of soiling, as well as of every branch of farming. This gentleman has lately gone to Flanders for the purpose of obtaining hints on farming, which it will be very desirable for him to communicate to the readers of this Magazine on his return. His general practice of husbandry deserves a minute but very brief notice from me. Mr. Lloyd's farm (with a southern aspect) consists of one hundred and twenty (Irish) acres, held in fee. The soil with a gravelly substratum is generally good; on the north side there is marl, within a few feet of the surface. His course is an eight year's shift—1st, ley oats,—2nd, potatoes and beans in drill or fallow,—3rd wheat,—4th, turnips, winter vetches in dry spots, cut early and succeeded by transplanted Swedish turnips—5th, barley laid down with rye grass and clover, two bushels of rye grass, and one of red clover to the acre, for at least three years. The turnips are consumed in the farm yard by stall fed cattle, young stock, and dairy cows, during the winter and spring.

The stock consists of forty dairy cows, (ten calves reared every year) ten two-year olds, ten yearlings, some older ones, to keep up the dairy stock, and the remainder fattened at three years old. The cows get hay and straw during the winter, with turnips, and in spring previous to their calving, and are soiled in the house during the summer on clover an dryegrass, except for short periods, (I don't like the exception,) during the hay-making season, and harvest. While being soiled, they are turned into the farm-yard for two hours every day for exercise and water.

Mr. Lloyd's establishment consists of a steward, whose wife acts as housekeeper, and superintends the dairy—two ploughmen—two boys to assist the stable, and in carting—two spademen—two cattle herds, (one of whom cuts soil in summer for the stock, and hay in winter for the horses,)—and two dairymen, with assistance at milking in summer. Occasional hands are employed in hoeing, weeding, haymaking, and binding in harvest. There are six horses, regularly employed, with occasional aid from young ones.

All that is wanting here in the soiling department, is some pure clover, to afford successive cuttings. To conclude, whether we consider the economy of the practice, or the health of stock abundantly fed on green food during the summer season, there can be no question as to the superiority of the soiling system.

### TO THE EDITOR OF THE NORWICH MERCURY.

SIR, I now beg leave to communicate a few observations regarding manure—and first as to quantity. Having by spade culture more soil, I must of necessity have more manure than by plough culture. The quantity I put on is thirty loads per acre annually. This quantity is not absolutely necessary, but being near Norwich that quantity is within my reach, and by this means I am enabled to reap two crops in the year.

As to the quality, my soil is generally rather light, and it is my good fortune to have a quantity of brick earth in one of my fields, and I dig it to the depth of six feet from the surface. In providing 150 loads of manure therefore for five acres of land, I first cast 100 loads of this earth for the bottom of my heap, and then put on 50 loads of muck. This earth receives the drain from the muck, which in wet weather is considerable, and I thus obtain when mixed together 150 loads of excellent manure at a moderate expence. But supposing I occupied a farm and kept stock, I should, supposing my stock would produce 50 loads of muck, first convey into my yard 100 loads of clay, brick earth, or mould, the best I could obtain for my purpose. This would receive all the drain of the muck from first to last, and would increase my manure (equally beneficial) threefold. It must be evident to every one of common observation, that a great portion of the virtue of the muck on the present plan sinks into the earth, and is of no use whatever but so far as the dimensions of the heap extend. No land is wasted by this plan, for I cultivate the surface of my pit the same as the other part of the field. I have often, Mr. Editor, been concerned to see the dilapidated state of banks raised in the neighbourhood of Norwich where the soil is loose; sometimes these defects arise from too much, at other times from too little moisture.

All fortifications are raised on an angle of 45 degrees, for it is well known to scientific men they will stand at no less, and for this plain and obvious reason, that if you throw up a mountain of sand, it will run down to that angle. In stiff soils the adhesive qualities will preserve the banks in their original position, but in loose soils the necessary repairs are a continual expence. I determined therefore to raise my fences on this angle, and they stand to admiration; but for the depredations of a rude population they would I am convinced, require no repairs, and against these they are considerable barriers.

It may not be amiss to state the simple method which I practice to form my angle. I take a common lath about two feet long, with which I form a circle on the ground, which I divide into eight equal parts; one of these parts taken from the centre from the two legs of an angle of 45 degrees. I take the lath of two feet in length for my upright, the other leg which I design for the slope of my bank I carry out to the length the height of my bank requires.

The only precaution required in using this instrument is to keep the upright leg a true perpendicular—for this purpose the line and plummet used by builders will suffice. In my next I shall with your permission Mr. Editor, attempt to shew the kind of carriages which I consider the best adapted for agricultural purposes.

I am, Sir, yours truly,  
A PRACTICAL AGRICULTURIST.

### POOR LAWS IN IRELAND.

TO THE EDITOR OF THE SUSSEX ADVERTISER.

SIR,—I concluded my last letter by stating that if the landlords of Ireland were to pay that attention which the landed proprietor of England and Scotland bestow upon the improvement of their estates, no doubt could be entertained that the produce of land already cultivated in Ireland might very speedily be doubled, and that a very great addition might be made to the present amount of Irish rents without at all distressing the cultivators.

The subject of Irish rents is much misconceived in this country. One hears of six, eight, or even ten guineas per acre talked of as rent paid for land in Ireland; and too often jumps at the conclusion that an Irish proprietor receives a much higher rent for his estate than an English landowner. That there are in Ireland many acres of land, which for a single season, let for ten guineas, is undoubtedly true; but it should be recollected that these are small parcels of land, termed in the language of that country "con acres;" that is to say, single acres of fresh and unbroken soil, which having remained long in a state of pasture, are ready and fit for the production of an excellent crop of potatoes. The occupier, or to speak more correctly, the cropper of this acre, incurs no other charge in respect of it, than the labor of planting; he pays no rates, taxes, or other outgoings; all these are defrayed by the person who lets the land. In addition to this, it should also be remembered, that in point of extent, the Irish acre bears to the English acre a proportion of 7840 to 8840. This reduces the rent of ten guineas to about six pounds per English acre. This is the enormous rent which is sometimes said to be paid for land in Ireland. All that can be gathered from the statement, however, is the fact that under peculiar circumstances of situation and culture, some detached acres of land, in a condition fit for immediate cropping, let for about six pounds the English acre. Now I would ask, what would an English farmer, occupying a soil of very moderate fertility, say to an offer of such a rent for one season for an acre of land, which having been long laid down to grass, or having been plentifully manured, should be considered capable of yielding an abundant crop of potatoes? I am inclined to think that he would laugh at an offer of even double that amount. With the exception of land let under the circumstances just detailed, rent in Ireland is greatly below the average rate paid for land of equal

quality in England. I have seen various estimates drawn up by persons well acquainted with the subject; and in none of these is the average of Irish rents, taking the whole of the cultivable land into the account, estimated at a higher rate than fifteen shillings per Irish acre. When the natural fertility of that island is considered, nothing can furnish a more decisive proof of the backward state of Irish agriculture. An improved and energetic system of tillage; the application of more labor to the cultivation of the soil, would probably, in twenty years double the rents; if the population which now subsists in complete idleness, or upon half employment, were regularly and constantly occupied in digging, ploughing, and hoeing, they would not only raise an ample supply of provisions for themselves, but also a very large surplus, which would go, in the form of an augmented rent, into the pockets of the landlords. The improved system of agriculture followed in this country, owes its introduction chiefly to the efforts and encouragement of enlightened proprietors resident upon their estate. But with exceptions that have little effect upon the general produce of the country, no successful attempts have been made to introduce the convertible system of husbandry into the South of Ireland, although the tenantry are stated to be really desirous of following any useful advice which might be given them upon the subject: hence, the land, having yielded a few crops of potatoes, is then allowed, for a long succession of years, to fall into a state of nature, and yields both to the cultivator and the public, infinitely less than it would produce under an improved system. During the seed-time and harvest, the Irish peasantry are fully employed, each upon his own allotment; but those seasons over all demand for labor ceases, as they are generally unacquainted with the various processes practised by skilful cultivators to increase the productive powers of the soil.

It may, with perfect truth, be said, that the whole attention of the body of Irish cottiers, is devoted solely to the cultivation of one crop—the potatoe. They bestir themselves in the spring while planting, and in the autumn while taking up this crop; but, with the exception of those who come over into England in pursuit of employment during the summer months, the rest of their time is spent in absolute idleness, and thus entirely lost both to themselves and the public. This idleness and waste of time, is the true source of all the poverty and misery which are so prevalent in Ireland: they are really employed only during about three months in the year, and hence it cannot appear at all wonderful that men who are idle for nine, out of every twelvemonth, should be steeped in poverty and distress. Some of the most enterprising and industrious come over to England in the beginning of the summer in pursuit of work; they return home with their earnings at the close of the harvest season, and live with their families in perfect idleness, until the ensuing spring, when they again set out upon their travels.

The present distribution of the Irish population seems to me, to bear considerable resemblance to that which prevailed in this country, as lately as the close of the sixteenth century: until that period many of the evils now complained of in Ireland existed here; and it appears, at least, probable, that they would yield to the discreet application of the same remedy.

It will be seen that I have suggested the introduction into Ireland, of a proper system of laws for the management of the poor, not for the purpose of enabling the idle to subsist at the expense of the industrious, but of forcing the owners of land to pay some

attention to the habits and occupations of the peasantry. The misery which prevails among the Irish population is all brought on, not by any peculiar oppression under which they labor, but by their own bad management and inactivity; they are mostly stout and active, and can work well if they will; but the *will* to work is generally wanting: hence the quality of their fare, the slovenly appearance of their dwellings, and the raggedness of their clothing. A large proportion of them live entirely on potatoes and salt, with an occasional supply of milk in the summer months:—the fire being in the middle of the hovel, the pot in which they boil the potatoes, is set on three stones, and the man, his wife, and their children, all sit round, enveloped in smoke. If the family possess any poultry, a pig, a cow, an ass, a horse, they are all inmates of the same cabin, and the provender which they get for these animals, which sometimes extends to the luxury of a few oats, is laid down on the floor, which is composed of the natural earth. With all this company it may easily be conceived, that the floor must be nearly as dirty as the highway; yet the whole family generally lie on it, and there is not a seat to be met with in the house. That their clothing appears so ragged is entirely their own fault; they are so lazy, that as long as they can get any new clothing, they will never mend any of the old. They never darn a hole in the stocking, but wear it till the foot comes off; and they treat every other part of their dress in the same manner.

I had intended to have brought my remarks to a close, in this letter, but as it has already grown to what I fear you will consider an alarming length, I must trespass upon the columns of your next week's paper.

I am sir, your obedient servant,

Lewes, June 16, 1835.

JUSTITIA.

#### TO THE EDITOR OF THE MAIDSTONE GAZETTE.

SIR,—The hop-grower hails with pleasure the appearance of the lady-bird, when his bine is infested with lice. He knows the efficiency of the lady-bird in clearing bine, but is he equally well acquainted with the same beneficial propensity of it in its earlier stage of existence?

The larva of the lady-bird is an insect of which I do not know the name. It is about half an inch long when full grown; jointed in the body; with six legs; of a dark-brown color, with a little yellow on the head, and four yellow spots on the body. It is somewhat like the glow-worm, but not so large. These shrimps or larva are as destructive of lice on the leaves of plants, as when in their perfect state. They lay themselves up or become pupæ for eight or ten days, and emerge lady-birds. I have many specimens in the larva, pupa, and perfect state, in a cage of gauze, now before me. They destroy only the plant lice or aphides, and feed on no vegetable matter.

This information, if it should be new to any hop-planter, may be instructive and useful to him.

I am, Sir, your obedient servant,  
WILLIAM MARTER.

Shelley's Farm, July 10, 1835.

P.S.—The insects which I have caged, to mark their transformation, were taken from some caraway plants. The species found on hops may not be exactly the same, for the varieties of this insect are very numerous.

**SMITHFIELD CLUB CHRISTMAS SHOW, 1835.**  
**IN THE REPOSITORY YARD, IN GOSWELL STREET,**

On FRIDAY the 11th, SATURDAY the 12th, and MONDAY the 14th of DECEMBER,

The Right Hon. EARL SPENCER, President.

VICE PRESIDENTS.—His Grace the DUKE of RICHMOND; the Right Honourable Lord WESTERN; the Honourable Lord STRATHAVEN; Sir JOHN SAUNDERS SEBRIGHT, Bart.; JOHN M. CRIPPS, Esq.

STEWARDS.—Mr. THOMAS CHAPMAN, Mr. THOMAS C. BEASLEY, and Mr. SAMUEL DRUCE.

BANKERS.—MESSRS. HOARE, Fleet Street.

COLLECTOR.—Mr. I. HAILES, Foxley Road, Kennington.

SECRETARY.—Mr. WM. FAREY, 37, Howland Street, Fitzroy Square.

PREMIUMS AND MEDALS offered, weight 14lbs. to stone, for stock duly qualified and properly certified, according to the general and particular conditions below, and the blank forms opposite.

CLASS 1. Oxen or steers, of any breed, under 5 years of age, without restrictions as to feeding, yet the kind or kinds of food must be certified.

To the feeder of the best fat ox or steer, a premium, plate or money, 20 sovereigns.

To the breeder of the same, a silver medal.

CLASS 2. Oxen or steers, of any breed, under 6 years of age, weight 90 stone and upwards, that shall not have had cake, corn, meal, seeds, grains, or distillers' wash, previous to the 1st of August, 1835.

To the feeder of the best fat ox or steer, 1st premium, plate or money, 20 sovereigns.

To the breeder of the same, a silver medal.

To the feeder of the second best ditto, the 2d premium, plate or money, 10 sovereigns.

CLASS 3. Oxen or steers, of any breed, under 5 years of age, under 90 stone and above 70 stone weight, that shall not have had cake, corn, meal, seeds, grains, or distiller's wash, previous to the 1st August, 1835.

To the feeder of the best fat ox or steer, the 1st premium, plate or money, 15 sovereigns.

To the breeder of the same, a silver medal.

To the feeder of the second best ditto, the 2d premium, plate or money, 10 sovereigns.

CLASS 4. Oxen or steers, of any breed, not exceeding 4 years and 3 months of age, under 70 stone weight, that shall not have had cake, corn, meal, seeds, grains, or distiller's wash, previous to the 1st of August, 1835.

To the feeder of the best fat ox or steer, a premium, plate, or money, 10 sovereigns.

To the breeder of the same, a silver medal.

To the feeder of the second best ditto, the 2d premium, plate or money, 5 sovereigns.

CLASS 5. Fattened cows or heifers, under 5 years of age. Freemartins and spayed heifers are not qualified.

To the feeder of the best, a premium, plate or money, 15 sovereigns.

To the breeder of the same, a silver medal.

CLASS 6. For fattened cows, of 5 years old and upwards. Freemartins and spayed heifers are not qualified.

To the feeder of the best fat cow, a premium, plate or money, 15 sovereigns.

To the breeder of the same, a silver medal.

CLASS 7. Long-woolled fat wether sheep, one year old, that have never had cake, corn, meal, seeds or pulse.

To the feeder of the best pen of three, under 22 months old, 10 sovereigns.

To the breeder of the same, a silver medal.

CLASS 8. Long-woolled fat wether sheep, one year old, without restrictions as to feeding.

To the feeder of the best pen of three, under 22 months old, the 1st premium, plate or money, 10 sovereigns.

To the breeder of the same, a silver medal.

To the feeder of the second best ditto, the 2d premium, plate or money, 5 sovereigns.

CLASS 9. Long-woolled fat wether sheep, two years old, without restrictions as to feeding.

To the feeder of the best ditto, above 22 and under 34 months old, a premium, plate or money, 10 sovereigns.

To the breeder of the same, a silver medal.

CLASS 10. Short-woolled fat wether sheep, one year old, without restrictions as to feeding.

To the feeder of the best pen of three, under 22 months old, the 1st premium, plate or money, 15 sovereigns.

To the breeder of the same, a silver medal.

To the feeder of the second best ditto, the 2d premium, plate or money, 5 sovereigns.

CLASS 11. Short-woolled fat wether sheep, two years old, without restrictions as to feeding.

To the feeder of the best ditto, above 22 and under 34 months old, a premium, plate or money, 10 sovereigns.

To the breeder of the same, a silver medal.

To the feeder of the second best ditto, the 2d premium, plate or money, 5 sovereigns.

CLASS 12. Pigs, of any breed.

To the feeder of the best pen of three, above 4 and under 9 months old, the 1st premium, plate or money, 10 sovereigns.

To the breeder of the same, a silver medal.

To the feeder of the second best ditto, the 2d premium, plate or money, 5 sovereigns.

A gold medal, value 5 sovereigns, to be awarded to the breeder of the best beast that is exhibited in any of the above classes, provided of sufficient merit.

A gold medal, value 5 sovereigns, to be awarded to the breeder of the best pen of long-woolled sheep, exhibited in the 7th, 8th, or 9th classes, provided the judges consider them of sufficient merit.

A gold medal, value 5 sovereigns, to be awarded to the breeder of the best pen of short-woolled sheep, exhibited in the 10th or 11th classes, provided the judges think them of sufficient merit.

**EXTRA STOCK.**

A silver medal will be presented to the exhibitor of the best beast in extra stock.

A silver medal ditto, to the best long-woolled sheep in extra stock.

A silver medal, ditto, to the best short-woolled sheep ditto.

A silver medal, ditto, to the best pig. If the judges in each case deem them worthy of commendation.

THE BET OF LAST YEAR ALTERED.—A BET—“Lord Huntingfield bets with Mr. Charles Stokes to produce in each of the years 1836, 1837, and 1838, two Hereford steers, against Mr. Stokes's two Durham steers, all of them to be under 36 months old, to be bred by themselves; and for 5 sovereigns each year, the best to receive the bet.”

**A MATCH.**—Between Earl Spencer and the Marquis of Exeter, for 10 sovereigns; Lord Exeter's Freemartin heifer, calved in September 1832, against Earl Spencer's Freemartin heifer, calved in May 1832; Earl Spencer to allow 6 stone (14lb. to the stone) to Lord Exeter in consideration of the difference of age; each bred by themselves, and to be without restrictions as to feeding.

**GENERAL CONDITIONS, APPLICABLE TO ALL THE CLASSES.**

(*Weight 14lbs. to the stone, sinking the offal.*)

Dead weight returns of every animal exhibited for these premiums must be sent by the butcher who slaughters them to the Secretary as early as possible after the show.

Each animal, whether shown for premium, medal, or extra stock, must have been at least six months in the possession of the exhibitor.

**CERTIFICATES.**—The breeder's certificate of the age of all animals shewn for premiums or gold medals (Scotch, Welsh, and Irish cattle excepted,) must be sent to the Secretary along with the feeder's certificate. The feeder's certificate is to contain the name, designation, residence, and post town of the feeder—the name of the breed—the number of the class in which the animal is to be exhibited—the christian and surname, residence, and post-town of the breeder—the pedigrees of the animals exhibited, as far as they can be obtained—their ages at the date of the show—and the kinds of food upon which the animals have been fattened, must all be certified;—and each certificate must be signed by the feeder, and dated a short time before the show.

**CERTIFICATES, AND ARRIVAL OF.**—They must be sent per post, or otherwise, so as to reach Mr. Wm. Farey, No. 37 Howland street, Fitzroy square, on or before Thursday evening, the 3rd of December, 1835; each certificate must be filled up either in, or copied agreeably to, the printed form, written on one side only of the paper, and if more than one certificate is written, it should be in such manner that they can be separated. Without attention to the above particulars, the feeders of such animals will not be entitled to standing, straw, and hay at the expense of the club, during the show; and animals positively cannot be admitted into competition for the premiums, or medals.

No animal or pen shall gain more than one premium (medals excepted;) not more than one beast to be sent, in either of the classes: and only one pen of three sheep, or three pigs, belonging to the same person, can be allowed to enter the show yard, unless certified to be exhibited for separate premiums, or as extra stock.

That no beast, sheep, or pig, once exhibited here for a premium, be again permitted to enter the yard, at any future show, except as extra stock; and the paper sent to the Secretary, must mention such previous exhibition, here or elsewhere:—no bull or any boar, above 12 months old, can be permitted to enter the yard.

**EXTRA STOCK.**—Only one ox and one cow to be received from any one person, and they must be properly described as to the age, breed, breeders' and feeders' names, residences, feeding &c.;—every animal sent, whether for a premium, or as extra stock, must have been previously so described to the Secretary, in order that the labels may be prepared for every animal, or pen, that a yard gate-list of all such qualified animals may be sent to the show-yard, on

the morning of the 9th; and all stock not in such list will be refused admission.

**STOCK, ARRIVAL OF.**—All animals, intended to be exhibited at the show for a premium, must arrive at the yard before one o'clock on Wednesday afternoon, the 9th of December, and none can be admitted after that time; and that no extra stock be admitted into the yard during the time the stewards are classing and arranging the stock, or the judges deciding the premiums;—and that each candidate, or some one on his behalf, must be in attendance at the yard until the evening in order to answer any questions, as to the animals or certificates, which the stewards may require, while classing the animals.

**IMPLEMENTS, SEEDS, &c., ARRIVAL OF.**—They are required to be in the show-yard on the Tuesday previous to the show.

That no person, formerly a member, but withdrawn whilst standing indebted to the club, be permitted to show stock or other things.

That no person be allowed to untie or remove any of the animals from their places during the show.

**PARTICULAR CONDITIONS, IN ADDITION TO THE GENERAL ONES ABOVE.**

**OXEN.**—That the age, in years and months, of each ox or steer—the distance each has travelled on foot or in caravan from the place of feeding to the show, and if partly by canal-boat it should be mentioned how far—also in class 2, 3, and 4, the case of those oxen or steers that have been fed on corn, meal, cake or seeds, that no corn, meal, cake, seeds, grains, or distiller's wash were given to them previous to the 1st of August, 1835.—and the kind and quantity of corn or meal, and the weight in pounds (and not the number) of oil cake or of oily seeds they have consumed, must all be certified.

**COWS.**—The cows exhibited in classes 5 and 6, the whole number of times of calving, if any,—the ages of the cows,—the breeders' names, residences, and post-towns, and the distances the cows have travelled on foot (or in a caravan or boat) from the place of feeding to the show, must all be certified. There is no restriction as to feeding in either of these classes, but the kind or kinds of food on which the cows have been fed must be mentioned in the certificate.

**SHEEP.**—The three sheep in each pen must all have been lambed in the same year, and bred by the same person, and that the sheep in class 7 have never eaten cake, corn, seed, pulse, or meal of these must all be certified. They must be shown in their wool.

**PIGS.**—That each pen of pigs exhibited, are all of the same litter, and the kind of food upon which they have been fed for the last three months previous to the show, must be certified. The quantities also of food would be desirable.

**THE STEWARDS' INSTRUCTIONS.**

The stewards are requested to meet on Wednesday morning the 9th of December, to receive from the Secretary the several certificates, and to reject all stock entering the yard, unless their certificate have been received in due time by the Secretary; and in case of informality detected by or shown to them, before awarding; and whenever any objection is made to the certificate which accompanies any stock that are exhibited, that such disputed certificate be submitted to the stewards and judges for such sort of stock, and that they do settle finally upon such objection; that if it appears to them that there is any material incorrectness in the certificate, which was wilful, that

they report it to the club, and the club have determined that if mistatements, or wilful incorrectness shall at any time be detected in any certificate, the premium shall be withheld, and such candidate shall, for wilful mistatement, be deemed disqualified ever afterwards. The stewards are requested to close the show-yard gate at one o'clock noon, on Wednesday the 9th to arrange the stock, and number each lot, and on Thursday morning to meet the judges, and while examining each animal, to read to them such parts of the certificates as are in conformity with the printed forms for each class, omitting from them all such matter as is not required to be certified by the rules of the club, and the names of all persons and places, as the exhibitors, breeders, &c. The stewards are also requested to read the whole of the certificates sent with the extra stock, omitting only the names of persons and places therein:—they are likewise requested to mark the ear of all the one year old sheep exhibited at each show, and no sheep in the show-yard are allowed to be shorn until after the judges' award, and not then, without permission of the stewards.

#### THE JUDGES' INSTRUCTIONS.

After the stewards have classed and affixed numbers over each animal, or pen, the Judges (without knowing any names of parties or places, until after their decision) are to determine and adjudge, by the numbers, for the best fat stock, having regard in forming their judgment—to quality of flesh—lightness of offals—age—feeding—and to early maturity in sheep and pigs, and also in oxen, if not worked,—and in cows to the age and number of calves; but the Judges are requested to observe that in the classes 1, 5, 6, 8, 9, 10, and 11, the prizes are offered without restrictions as to feeding; yet to keep strictly in view the object for which the Smithfield Club was originally instituted, viz. The supplying of the cattle markets of Smithfield, and other places, with the cheapest and best meat.

The feeder's certificate of feeding to be evidence to the Judges, if not contradicted by counter evidence; in which events the stewards and judges will determine on the case, from the circumstances of it, without reference to any other persons. The breeder's certificate to be the only evidence of the ages. When the judges shall have reasonable doubts, as to the weight of any ox or steer, which they may deem to be worthy of the premium intended for such an ox or steer, he shall not, on account of weight, be excluded, provided, in the opinion of the judges, he does not vary from the limited weight, by more than one-twelfth part thereof. And that any ox who shall be excluded from class 3 or 4, in consequence of being above weight, may be exhibited for the Silver Medal offered in extra stock. They are not to adjudge any premium, unless they shall deem the animal or animals, exhibited for such premium, to have sufficient merit, especially where there is no competition. And the judges are to be allowed the whole of Thursday, without the admission of strangers, for making their adjudication, and signing their award.

At the meetings of the Club, held in the parlour of the Show Yard, on the 12th, and on Monday the 15th of December last, Earl Spencer, President, in the chair,

It was Resolved, that no person be allowed to send more than one ox and one cow into the yard as extra stock; that an additional premium of ten sovereigns be offered to one-year old long-woolled sheep, with restrictions never to have eaten cake, corn, seeds,

pulse, or meal of these; and a silver medal to the breeder of the same.

That the first premium for one-year old short-woolled wethers be altered to 15 instead of 10 sovereigns; that an additional five sovereigns be added as second prize to the two-year old short-woolled wethers; that any ox or steer who shall be excluded from Class 3 or 4 in consequence of being above weight, may be exhibited as extra stock, and may compete for the medal given to extra stock; that steward's instructions be printed in the next bill. Four noblemen and seventeen gentlemen were elected new members of the club. The secretary was ordered to incorporate all the alterations and get the new bill printed, advertised and circulated as usual.

Exhibitors and members are requested to pay proper attention to the conditions; and to make them known amongst any of their acquaintance, who may be likely to send stock, or useful implements, roots, seeds, &c. to the show. That no charge will be made for the standing of any stock, by whomsoever exhibited, if certified properly, and in time, to the secretary, or for any implements or seeds, &c. exhibited by the members of the club, except before Tuesday the 8th December, and after dusk on Monday 14th.—Any breeder or grazier may have one of these bills sent by the post, on writing for it to the secretary; or their Smithfield salesman can, at any time procure them a bill in Smithfield Market, by calling at Mr. Mitchell's, Draper's Shop, No. 57, near Duke-street; at Mr. Plenty's, Implement Factory, in the market; or of Messrs. Thomas, Silversmiths, No. 153, New Bond-street.

The next meeting of the Club will be held in the parlour of the Show-yard, on the Friday of the Show, the 11th of December, at Three o'clock.

EARL SPENCER, PRESIDENT, Chairman.

FORMS FOR CERTIFICATES, one of which, proper to the CLASS, the Candidate is required to use or follow in preparing his CERTIFICATE, for each beast, or pen of sheep, or pigs, intended to be shewn in December, 1835, agreeably to the general and particular conditions before mentioned; and which Certificates must be delivered to the Secretary, on or before Thursday Evening, the 3rd of December, being six days before the stock are to arrive in the Show-Yard, as there mentioned.

W. FAREY, SECRETARY,  
37, Howland-street, Fitzroy-square.

For Steers or Oxen, under five years of age, to be any how fed, Class 1.

I of near in the county of , do certify, that my ox or steer, of the breed, to be shewn for the premium in Class 1, was bred by Mr. [see the breeder's certificate of age sent herewith] from the stock of Mr. ; he will at the show be years and months old, and was fed by me, on He travelled on foot miles from the place of feeding to the show.—He has been in my possession since the 1st of June, 1835.

Witness my hand [viz. the feeder's] this of 1835.

For Oxen, fed on cake or seeds, and without corn or meal, Classes 2, 3, or 4.

I of near in the county of , do certify, that my ox, of the breed, to be shewn for the premium in Class , was bred by Mr. [see the breeder's certificate of age sent herewith] from the stock of Mr. ; he will at the show be years and months old, and was fed by me, on ; no

corn, meal, cake, seeds, grains, or distiller's wash were given to him previous to the 1st of August, 1835; the [weight not number] of cake or seeds he consumed was lbs., and the quantity [if any] of corn He travelled on foot miles, from the place of feeding to the show.—He has been in my possession since the 1st of June, 1835.

Witness my hand, [viz. the feeders's] this of 1835.

*Form for Breeders' Certificates of Oxen or Steers in Classes 2, 3, or 4.*

I of near in the county of do certify, that the ox, Mr. intends shewing for Class , was bred by me, and will at the show be years and months old; he has not had, while in my possession, after the first of March, 1835, either cake, corn, meal, seeds, grains, or distiller's wash.

Witness my hand, [viz. the breeder's] this of 1835.

*For Fattened Cows any how fed, Classes 5 or 6.*

I of near in the county of do certify, that my fat cow or heifer, of the breed, to be shewn for the premium in Class , was bred by Mr. [see the breeder's certificate of age sent herewith] from ; she will at the show be years and months old; has calved at her full time, separate times; she was fed by me on . She travelled on foot miles, from the place of feeding to the show.—She has been in my possession since the 1st of June, 1835.

Witness my hand [viz. the feeder's] this of 1835.

*For Long-Woolled Wether Sheep, One Year Old, that have never eaten cake or corn, Class 7.*

I of near in the county of do certify, that my three wether sheep of the breed, to be shewn for the premium in Class VII. were each bred by [see the breeder's certificate of age sent herewith] from ; they will at the show be months old; they have not at any time eaten cake, seeds, corn, pulse, or meal of these.—They have been in my possession since the 1st of June, 1835.

Witness my hand, [viz. the feeder's] this of 1835.

*For Wether Sheep any how fed, Classes 8, 9, 10, or 11.*

I of near in the county of do certify, that my three wether sheep of the breed, to be shewn for the premium in Class , were each bred by [see the breeder's certificate of age sent herewith] from ; they will at the show be month old.—They have been in my possession since the 1st of June, 1835.

Witness my hand, [viz. the Feeder's] this of 1835.

*For Pigs, Class 12.*

I of near in the county of do certify that my three pigs, of the breed, to be shewn for the premium in Class XII., are of one litter; were bred by [see the breeder's certificate of age sent herewith] from ; and will at the show be weeks old, respectively, and have been fed by me, on . Within the three last months their food has been . They have been in my possession since the 1st of June, 1835.

Witness my hand, [viz. the feeder's] this of 1835.

## ON THE CULTIVATION OF TURNIPS.

TO THE EDITORS OF THE IRISH FARMER'S MAGAZINE.

This is a crop so essential to introduce in order to insure a good and profitable system of husbandry, that it must be a matter of surprise to the experienced farmer why its cultivation is so limited in many parts of Ireland, notwithstanding there is an extensive tract of land in most counties well suited to its introduction. Indeed it is well ascertained that, in many instances, different sorts have been grown with great success; also that the expense of producing them—especially the Norfolk and Globe—is trifling, compared with the cost and trouble of a potato crop. A question, then, naturally arises—why are not turnips more generally cultivated? I have heard the different opinions of many intelligent agriculturists on this subject, yet none of them are advanced to condemn the turnip system, but merely to prove the difficulties to be combated before it can be advantageously introduced;—it may be therefore advisable to investigate those objections, and see if they cannot be counteracted.

In the first place it has been stated that—although there is much land suited to the growth of turnips in Ireland, yet it is not of that nature to be benefited by eating the crop off in the winter or spring months: consequently, that if it is necessary to draw the turnips off the land to be consumed elsewhere, the object of their cultivation for its improvement cannot be effected. Now when this is the case, I admit the principle to be good; but from what I have witnessed in passing through many counties in Ireland, I am satisfied there is a very large proportion of soil, on which the turnip crop could be fed on the land, and which never having grown this crop, would produce abundantly, with the aid of a small dressing of manure. Indeed I have seen good crops of white and red turnips produced after a good fallowing, sown in July; and surely this is a better system than risking a crop of wheat after a fallow, should the land not be in good condition.

Second—it is argued that a turnip crop is precarious, from being so liable to destruction from the fly. This is admitted: but is not a potato crop liable to casualties also—not only in its infancy, but in its growth? An extensive dry summer will materially diminish the weight of the produce; and a very wet and cold one, the quality of the tubers—in fact all crops are subject to casualties, and even failure; therefore this can be no fair objection to the cultivation of turnips. I have had much information from experienced farmers in England and Scotland on this matter, and it seemed to be their general opinion—that although a first or second sowing of the seed may fail, yet a third sowing is usually successful: and that by proper attention and good management, there is rarely a failure of the crop. Besides, as there is a variety of these roots which can be advantageously cultivated for sheep, each of which require different periods to be deposited, the farmer can easily manage to prepare his land to suit this circumstance; and in case of failure from the fly, or drought, he can renew the sowing with a later sort of seed.

The third objection is the most serious, and, I fear not so easy to counteract or be provided against, namely—the depredations committed on those crops; or to prevent this—the great expense of protecting them from being plundered. It may be naturally asked, however,—why should this be permitted more in Ireland than in England? for the same laws for the protection of green crops, exist here also; therefore, why should not the property of the industrious Irish farmer be equally safe from depredation? But

it is not turnips alone that are stolen, but peas, beans, and even potatoes, in many parts of the country; and for this reason—individuals are afraid to prosecute. It is well known, that on green crops being first introduced into Great Britain, the farmers had the same difficulty of protecting them as now exists in Ireland; but the landed proprietors and magistrates in the different districts, formed associations for this purpose, by which individuals were relieved from the expense and odium of the prosecution, and the offenders were punished by those patriotic bodies—this had the desired effect, and agricultural improvement flourished. The expense of such associations would be trifling to each individual, and the result most beneficial.

The best season for saving Swedes is early in June, but on rich soil in high condition, good crops may be obtained by sowing even three weeks later. The yellow Scotch is the next in succession, but also require to be well manured, especially if sown on light or dry soil. However, on such land the red Norfolk, the white Globe, or the Stone turnip, is a more certain crop; and although these don't go so far in feeding either sheep or cattle, yet on light soils there will be a much greater weight of produce than if sown with Swedes, or Scotch turnips. On strong land on which the crops cannot be fed off, it is advisable to add some extra manure at the time of sowing, by which the land will be brought into such good condition as to admit the crop to be carried off, and afterwards be in sufficient heart for a corn crop to follow. In such case the turnips, whether Swedes or Scotch, should be pulled as soon as full grown in December, the tops cut within an inch or two above the crown, and then carted to a dry piece of land, where they can be secured from the weather by a good covering of straw. The tops must be kept separate and given to the cattle or sheep. If the common turnips are drawn off in this manner they should be stacked and thatched for their security.

Large farms containing much light or thin soils, cannot be profitably managed without the introduction of the turnip system, for the expense of obtaining sufficient manure to keep them fertile without being occasionally renovated by the folding of sheep would soon swallow up the value of the crops produced. By the judicious introduction of turnip crops, the expense of manuring is much diminished; for half the manure that would be necessary for potatoes, would insure a good crop of the Norfolk or Globe turnip; and thus the land can be easily renovated. Barley and seeds should follow, if the land be sufficiently clean; otherwise it may be sown with barley or oats, but no seeds, and the succeeding year well cleaned for a turnip crop, and then laid down for grass. Clover or grass seeds seldom hit on foul land, and even should they succeed, their produce the following year will not remunerate for the expenses; besides a good crop of wheat cannot be expected to follow after an indifferent crop of clover, as it is from the bulk of the roots of the latter ploughed in, or its advantages as a smothering crop, that the land is fertilized for the succeeding one cultivated.

Some of the best crops of turnips I have seen have been obtained by burning the surface of coarse grass land, in the month of June, and seeding after one ploughing in the latter end of July. Half the quantity of ashes necessary for the production of a potatoe crop, is sufficient for the Norfolk or Globe turnip; therefore this system may be safely practised even on thin soil for a turnip crop, as only half the sods need be burned; consequently the land will be but little deteriorated. Excellent crops of turnips may also be obtained off reclaimed bog, or mountain soil, by the aid of ashes or lime; and although the produce

cannot be consumed on such land, yet the crop may be carted off for home consumption with advantage; for maiden soils of this description are but little reduced in quality by the production of the first crop; and even should this be the case, there is generally a great facility of renovating them, in consequence of their depth, by additional sprinkling of ashes preparatory to cultivating the corn crop.

I am aware, there are many intelligent farmers in Ireland, who advocate the cultivation of Mangold Wurtzel in preference to Swedes, or other turnips; but I am inclined to think that this former crop is cultivated in many cases more through necessity than choice, in consequence of the risk there is of the latter being plundered. I will admit Mangold Wurtzel to be a most valuable root, and very productive on deep and fertile land, or even on lighter soil, well manured; but it is a most exhausting crop, and therefore should not be sown for the purpose of renovating light or exhausted soils. No doubt it is valuable for milch and feeding cattle; but for sheep, turnips are far preferable, and can be obtained on soils of inferior quality, on which Mangold Wurtzel would scarcely pay the expense of cultivation. Let then the landed proprietors in their respective districts but effectually protect this sort of property, and the British system of cultivation and industry will before many years extend itself advantageously throughout Ireland.

E. BURROUGHS,

30, Upper Mount-Street.

#### LETTER TO FOX MAULE, ESQ., M.P., ON THE GAME LAWS.

Sir,—The extraordinary quantity of Game that has so long been the just and loud complaint of farmers in many parts of Scotland, seems still to suffer no abatement. The writer of this has had an opportunity of seeing many corn fields in the county of Fife roaded from one side to the other, and cropt as bare as if traversed and eaten with sheep. This is a grievous hardship at all times; but, in the present straitened circumstances of farmers, it bears upon them with double severity. That tenants placed in such situations can go on with the necessary improvements, and make good their obligations to their landlords is impossible, and to expect it is both unreasonable and unjust; but, in fact, it appears that there is something about Game that misleads the judgment, and hardens the heart. Gentlemen could be easily pointed out, who, if their stock were to break through their enclosure and injure their tenants' crops, would pay the damage frankly if demanded, or make an apology for the accident; and yet, although thousands of vermin issue from their preserves every night, and destroy acres, and damage fields to great extent, if the sufferer but dare to complain, he is marked as a discontented, fault-finding person, and loses favour for ever. This, to say the least of it, is certainly very inconsistent conduct, and is attended with intolerable oppression to the party suffering; and yet it appears in the present state of the law, no legal redress can be obtained. Surely nothing calls more loudly for legislative interference than this grievance does. And as you have most disinterestedly taken it upon you to procure, if possible, justice for the oppressed, the eyes of the suffering tenantry are intensely turned towards you.

As the writer is altogether unacquainted with the proposals you mean to submit to the honourable House, and as there is a great diversity of opinion on this subject, permit me to state my

own views on the best mode of redressing this grievance.

The tenantry of Perth, I think, once proposed, and many of the tenants of Fife are of the same opinion, viz. that the tenantry at large should be allowed to kill Game along with their landlords—that those who feed the Game has the best right to kill them, may be plausible enough, but lies open to the following objections:—

1st. From time immemorial the proprietors of the soil have considered themselves the proprietors of the Game, and any attempt to transfer the whole, or any part of it, to other hands, would be too great a change to expect success; and probably success is not desirable, as it might be a strong temptation to the sons of farmers to become sportsmen. Now, however good a thing field sports may be to those who have nothing else to do, they are calculated to induce habits of idleness and a waste of time in young persons, altogether at variance with that strict application of both their time and talents, which alone can give any reasonable hope of success in any department of business.

2d. Any law enacted to allow the tenant to kill Game as well as the landlord, might work on estates where the proprietor is indifferent about field sports; but, with landlords of sporting character, the first shot a tenant fired would be a signal of war betwixt the parties, which is of all things the most disagreeable. Besides there is a great number of farmers that neither can, nor has any wish to kill game, indeed, many of them would sooner submit to engage in the meanest drudgery on their farm, rather than attempt a thing they cannot do, nor would have any pleasure in.

3rd. The extermination of Game is not contemplated nor expected. Now if the landlord and tenant were merely joint proprietors of it, then who is to decide how much of it is to be killed, and how much left for a breeding stock? This is a point on which the parties would likely have very different feelings, and little chance of coming to a cordial agreement.

For these reasons it is difficult to see how any such system could work to the satisfaction of the parties; and the only efficient enactment that is most likely to redress the grievance, is simply to allow the landlord the full and free disposal of the Game, on the fair and equitable condition that he pay his tenants or neighbours for their maintenance. This to be ascertained by neutral men, appointed by the Sheriff of the County, at the expense of the landlords; and if the tenants should think they would have a better chance of justice by choosing their own man, let them have that liberty on condition they pay for him.

The strongest objection that probably can be brought against this plan, is the difficulty of ascertaining accurately the damages suffered by Game, and no doubt this difficulty is very great; but by appointing proper men, and these men examining the fields at proper seasons, they will come very near the thing. It is more difficult to please the parties than to do justice; for the proprietor, however highly he may esteem his Game, can scarcely be brought to believe that it is possible the damages could be so great, while the tenant overrating the mischief, can as little be brought to think these damages high enough; but it is no worse a sign of the justice of an award that it pleases none of the parties. Submitting these observations to your consideration, I am, Sir, your most obedient servant,  
A FARMER.

Banks of the Leven, 8th June, 1835.

## FOX MAULE'S ANSWER.

H. O., London, 16th June.

Sir,—I received your obliging communication, and return you my best thanks for it. We agree, I think, as to the existing leases, but not to future ones. I propose in my bill to afford compensation for all damage done in existing leases, and to allow the tenant to kill the game as *vermin* in all future leases where a direct bargain by clause in the lease is not made between landlord and tenant. This seems to me to be the fair way of proceeding, and I hope it will please the farmers. However, I will take all suggestions into my mature consideration, as my only object is to afford protection to the farmer.—I am, Sir, your most obedient,

F. MAULE.

## MR. MAULE'S BILL

*For the Protection of the Tenants and Occupiers of Land, in Scotland, against the injury done to their Crops by certain kinds of Game.*

Whereas the tenants and occupiers of land in that part of the United Kingdom called Scotland, suffer great loss and damage from the destruction of their crops by hares, pheasants, and rabbits, for the recovery of compensation for which no adequate remedy is afforded them by the existing law, and it is just and reasonable that such remedy should be secured to them, by altering, in some respects, the law relating to Game in that part of the United Kingdom.

Be it therefore enacted, &c., that from and after the passing of this act, it shall be lawful to and for any tenant or occupier of land in Scotland, held under or by virtue of any lease, missive, or agreement, entered into subsequent to the passing of this act, or to and for any person, to be from time to time appointed by such tenant or occupier as aforementioned, (where there is no condition to the contrary in such lease, missive, or agreement, but so long only as the appointment of such person shall not be recalled by the nomination of such tenant or occupier, of another person for that purpose), to kill or destroy any hare, pheasant, or rabbit, which may be found on the land occupied by such tenant, without taking out any license or certificate for killing game, or being liable in the duty thereon, and without any other qualification whatever, any law or custom to the contrary notwithstanding; provided always that it shall not be lawful for any such tenant or occupier to appoint more than one person to kill or destroy hares, pheasants, or rabbits, at one and the same time, excepting only when his lands may happen to lie more than ten miles apart from each other, in which case he shall be entitled to appoint one person for each such discontinuous possession; and provided further, that no such person so appointed shall be authorized to kill or destroy any hare, pheasant, or rabbit, as aforesaid, until ten days after notice of his appointment shall have been given in writing by such tenant or occupier to the surveyor of taxes for the district in which such lands are situated, and which notice shall state the full names and designation of the person appointed, and the lands on which he is to kill or destroy hares, pheasants, and rabbits, as aforesaid.

And be it enacted, that in case any tenant or occupier of land in Scotland, held under or by virtue of any lease, missive, or agreement, entered into prior to the passing of this act (where no special provision is made in such lease, missive, or agreement, relative to the game on such lands, and the settlement of the damage

done thereby to the crops of such tenant or occupier, and where the landlord will not consent to the tenant, or a person to be appointed by him, as aforesaid, killing and destroying the game on his farm,) shall consider that he has sustained any loss or damage from the destruction of his crops by hares, pheasants, or rabbits, whether reared on his lands, or which haunt the same from any neighbouring property; and he cannot agree with his landlord relative to such loss and damage, it shall be lawful to one person to be arbiter on his behalf in fixing the amount of such loss and damage, and the compensation to be made to him therefore; and the landlord of such tenant or occupier shall be bound, within ten days after receiving notice in writing of such appointment, to appoint, by writing under his hand, one person to be arbiter in his behalf for the settlement of such compensation, and to give notice in writing of such appointment to such tenant or occupier; and the arbiters so appointed shall, and they are hereby required, within one month after their appointment, to investigate the matter of such claim in such way as they may think proper, and to fix and determine the amount of such loss and damage, if any, which such landlord shall be liable for, and to pay to such tenant or occupier as compensation for the same.

And be it enacted, that in case the landlord shall not, within ten days after receiving notice of the appointment by the tenant or occupier of his arbiter as aforesaid, appoint an arbiter on his behalf, and give notice of such appointment to the tenant or occupier, in manner before provided, the arbiter so appointed by such tenant or occupier shall, and he is hereby required, within one month after his appointment, to investigate the matter of such claim in such manner as he shall think just and proper; and shall fix and determine the amount, if any, of such loss and damage, and declare the sum, if any, which the landlord shall be liable for, and pay to such tenant and occupier as a fair and reasonable compensation for the same.

And be it enacted, that in case the arbiters or arbiter, appointed as aforesaid, shall not decide the matter referred to him or them within the time before limited, it shall be lawful to the sheriff-depute of the county wherein the lands in question are situated, or any of his substitutes, and he and they is and are hereby required, at any time within one month after the expiring of the time within which such arbiters or arbiter ought to have given his or their decision as aforesaid, on the application of such tenant or occupier, and after ten days' notice of such application shall have been given to the landlord to nominate and appoint a fit and proper person to be arbiter between the parties relative to such loss and damage, and shall administer the oath *de fidei administratione officii* to such person; and the person so appointed shall, and he is hereby required to investigate the matter of such claim in such manner as he shall think proper, and fix and determine the amount of such loss and damage, if any, and declare the sum which the landlord shall be liable for, and pay to the tenant or occupier as a compensation for the same.

And in order to discourage the making of unfounded claims for compensation, as aforesaid, be it enacted, that it shall be lawful to the arbiters or arbiter, appointed as aforesaid, and he and they is and are hereby authorised and empowered, in case it shall appear to him or them that the claim made by any such tenant or occupier for

loss and damage as aforesaid was frivolous and vexatious, so to declare the same, and to order such tenant or occupier to pay to his landlord any sum or sums of money such arbiters or arbiter may fix and determine, not exceeding in all one-fourth part of the sum claimed by such tenant or occupier.

And be it enacted, that the decision of the arbiters or arbiter appointed as aforesaid, shall be given in writing under their or his hand or hands, and shall be final and conclusive, and not subject to question or review by suspension, advocacy, or reduction, or in any other manner of way whatsoever, and both parties shall be bound to implement and fulfil the same in every respect, and all execution shall follow thereon which may competently follow on a direct arbitral by the law of Scotland.

And be it enacted, that it shall be lawful to the tenant or occupier, after the decision of the arbiter or arbiters shall be given as aforesaid, to retain the amount for which the landlord is by such decision found liable to him, out of any rent due or which may fall due by him to his landlord, but it shall not be competent to any tenant or occupier before such decision shall be given, to withhold or delay the payment of any rent to his landlord, on the ground that he has any such claim for loss or damage.

And be it enacted, that all appointments which by this Act are required to be made by the landlord, and all notices to be given to or by him, shall be deemed sufficient if made by or given to or by his known factor or agent if he any have, and if any landlord shall be forth of Scotland and his factor or agent be not known, such notice shall be deemed sufficient if given on the doors of the parish church of the parish within which the lands in question are situated.

And be it enacted, that no tenant or occupier shall be entitled to avail himself of any of the provisions of this act, unless he shall make his claim for loss and damage as aforesaid, within three months after such loss or damage shall have been sustained.

#### APPLE TREES FOR COTTAGE GARDENS.

Mr. Thompson, of the Chiswick Gardens, gives the following selection of Apple Trees for Cottage Gardens, where the soil and situation are favourable for the production of the Apple:—Where the space will admit of only one tree, the best is the Ribston pippin; where two, the Ribston pippin and the Dutch mignonne; where three, the Wormsley pippin, Ribston pippin, and Dutch mignonne; where four, the Wormsley pippin, King of the pippins, Ribston pippin, and Dutch mignonne; where five, the Wormsley pippin, King of the pippins, Ribston pippins, Old nonpareil, and Downton nonpareil; where six, the Wormsley pippin, King of the pippins, Ribston pippin, Alfriston, Old nonpareil, and Downton nonpareil; where seven, the Wormsley pippin, King of the pippins, Ribston pippin, Alfriston, Dutch mignonne, Old nonpareil, and Downton nonpareil; where eight, the Wormsley pippin, King of the pippins, Ribston pippin, Bedfordshire foundling, Court pendu plat, Alfriston, Brabant bellefleur, and Scarlet nonpareil, or Downton nonpareil; where nine, the Wormsley pippin, King of the pippins, Ribston pippin, Bedfordshire foundling, Court pendu plat, Alfriston, Brabant bellefleur, Scarlet nonpareil, and Downton nonpareil; and where ten, to the preceding add Pennington's seedling.

## ON THE INFLUENCE OF PARENT-AGE ON OFFSPRING, IN BREEDING ANIMALS.

(*Farmer's Register.*)

The prejudice against speculation may be carried too far in matters which have not attained to perfection. No subject affords a wider scope for investigation, than those to which the Register is devoted. Among us agriculture is certainly in its infancy, and its zealous friends are left to inquire whether we had better entirely depend for information on writers in foreign lands, where soil, climate, political institutions, and popular habits are so different from ours—or occasionally make some efforts to grope our own way through the mystery that surrounds us. Until we begin to interchange opinions with each other, it is not likely that our interest in the subject will become very deep. And although we smile occasionally at each other's notions, yet I feel assured it will be the smile of good nature, and that any original article that may appear in the Register, written with a sincere desire to search after truth, will be received with pleasure by its readers. Indeed, Sir, I feel so certain that this apology is unnecessary, that I would not make it, were I not assured that many much better qualified are deterred from writing by these *good-natured* smiles. My excellent neighbour, —, could furnish you with an article on the culture and management of tobacco, or on many other subjects, which you would gladly receive, were he not afraid of finding by the succeeding number of your work, that some person had been greatly amused by it.

In your second number I read with much pleasure some sensible remarks extracted from the "New England Farmer," on the subject of breeding cattle. The hereditary transmission among brute animals of peculiar powers and qualities, from ancestry to offspring has, in some countries, long excited great interest among farmers as well as gentlemen of the turf. We in Virginia delight in looking at fine horses, and riding them too; and some few among us know very well how to raise them. But, in the general, we are guided more by fancy for the individual animal, or the price of the season, than by the rules of breeding. The most common error is, to breed from a small delicate mare and a large coarse horse, and *vice versa*—thus destroying every natural tendency to the production of peculiar powers and qualities, and reducing the race of our horses to a standard of common mediocrity. In rearing cattle we *seem* to have a rule, which is, to breed from that race which can most hardly endure the extreme of privation in food, water, and salt, the most cruel beating from negroes, and which requires the least shelter from weather. Whatever may be its design, its certain tendency is, to produce the most worthless animal that the race is capable of affording. I have known a man who experimented with so much economy, as actually to ascertain that a cow could be sustained through a hard winter on a single ear of corn a day. This beats Paddy's horse, for he died as soon as he had learned to live on nothing.

Having, in the general, in my section of the state (the tobacco region) a stock of cattle descended from ancestry reared according to the foregoing rule, we have felt but little need of any other rules; for with but one breed, we could not well apply rules for mixing breeds. For some years, however, a spirit has been awakening for improvement on this subject, and although not

general, and not often directed by skill on the subject, has already produced very manifest benefit. This spirit has led to the raising from the best animals among us, and in some neighbourhoods to the purchase of cattle from the mountains. And, until animals of the peculiarly fine races become more common, we will have to rely chiefly on these sources. I am very glad to learn that there are gentlemen in various parts of the state who have been willing to incur both trouble and expense, in order to introduce stock of cattle, hogs and sheep, of superior races. I expect that much benefit will result to the public, and I hope also to these patriotic individuals, from their efforts.

I should be highly pleased, were it in my power, to furnish an abstract of all that is known on the subject of breeding. If there be infallible rules for improving the breeds of animals, in relation to any given points of form, powers, or qualities, I have not access to the books which contain them. But having long been an observer of the laws by which nature seems to regulate the transmission of these things from parents to offspring, I have thought the result of my observations might not be unacceptable to you and your readers. I will attempt to offer them in the following propositions.

1. The direct offspring of two animals, belonging to different races of the same species, partake equally of the peculiarities of both parents, in colour, form, powers, and properties, and may be called mongrels. The mulatto, whose parents are one white and the other black, forms a suitable example of what is here meant, for, in every particular he seems to stand half-way between the white man and the negro. I would advert particularly to the mongrel character of his hair: it is neither straight nor very much crisped, but woolly. Animals of this description, while they are almost certain to attain to mediocrity in physical qualities, rarely rise much above it in any one particular. The offspring of the blooded racer and the dray-horse, for instance, might transcend the former in weight and strength, and the latter in speed, while his running powers would bear no comparison with those of the former, nor his size and strength with those of the latter.

2. In order to form distinctively a new race possessing some characteristic peculiarities, it is necessary that both parents should be mongrels, similarly descended. An example of this kind occurs in the offspring of two mulattoes. Persons of this description approach towards the peculiarities of the Indian. They are apt to be straight, active, delicate, and somewhat deficient in strength. Their most striking peculiarity, however, is a remarkable glossiness of hair. This, though often perfectly straight, is sometimes curled, yet always shining and free from crispness. I have been able, from this appearance of the hair, to pronounce—and, on inquiry, found the opinion correct—that a child, itself nearly black, being three-fourths negro, had white blood through both parents. The mongrel between the hound and cur dog mingles the qualities and appearance of both races remarkably, but the offspring of two such mongrels, is a slender swift animal, somewhat resembling the wolf in appearance, and possessing such a wolf-like propensity to attack sheep, as to insure its own extinction as a race wherever I have known it.

It is generally believed that animals take size from the sire: this is certainly true with the canine species. I have known many a very large

dog whose mother was a fice, and I own a very small one whose mother was a hound of ordinary size. I mention these facts with a view of suggesting, that it might be proper, in order to obtain in perfection the characteristics that might belong to a new race, to alternate the sexes of its progenitors in such a manner, as that a due transmission of the qualities to be derived from each of the sexes might be insured. For example, I have been informed by a friend, that the Durham short-horned breed of cattle may be produced by crossing the Holderness with the Alderney breed. Now, I would judge it necessary, in order to give sex its due influence on the progeny, that the sire of one of the mongrel progenitors of such a race, should be a Holderness bull, and that of the other an Alderney. Indeed, the objects in view might possibly be more perfectly obtained, by beginning with four animals bred with reference to this principle. It may be here objected, that so much intricacy in the formation of a new race, seems to be in opposition to the simplicity of nature. But we find nature—while she sufficiently yields her secrets to patient observation, for all useful purposes—constantly guarding the durability and value of her works against the injuries of mere casualty. It is not difficult to conceive what a mongrel world this would have been long since, if simply a first crossing of animals could have constituted the fundamental characteristics of a distinct race.

Some distinguished breeders have held the opinion that breeding "in-and-in" affords important benefit in the improvement of stock. May not this have arisen from the better opportunity thus afforded of more perfectly mingling the elementary essentials of new race? Nothing, I believe, is better settled among us Virginians, than that this practice will deteriorate an old-established race. And we find it necessary to change our breeding animals frequently. My own cattle are descended from a stock which, five and twenty years ago, were remarkable for size and deep milking. They were the offspring of an imported English bull—I know not of what peculiar race; and although some slight resemblance to their progenitors may still be seen, yet they are now small and very scanty milkers. This I ascribe chiefly to breeding in-and-in. The distemper among them almost compelled the continuance of this practice, as it destroyed new comers. I am now determined to introduce a new set, and brave the risks of that malady.

I profess to know very little on the subject of breeding horses. What I have to say, should, of course, be taken in the way of surmise. I believe it is generally admitted that a great improvement in the breed of race horses was effected by the introduction of the Arabian horse into England. Now, in conformity with the foregoing principles, I would suppose that mongrels, or animals produced by the first crossing between the Arabian and the old English horse, would not distinguish themselves so admirably on the turf, as their offspring who might inherit the blood of the Arabian and of the old English race-horse, both on the side of the sire and the dam. And further, those breeds which have distinguished themselves greatly on the turf, will probably be found, on examining into their pedigree, to have inherited an equal share of Arabian blood from the male and female progenitors.

There can be no doubt but that nature is regulated by fixed laws in the formation of distinctive breeds or races of animals, which, if known, might guide to the transmission of any particular desir-

able quality. In attempting to develop these laws, we may readily conclude that they are not to be found in the first cross, because of the unequal influence which the sexes exert on their progeny, and because of the multiplicity of races which would thus be formed, liable constantly to deterioration from every admixture. We must then seek for them by breeding in-and-in, from the same stock, until we get a due mixture of the two races used in the experiment, or,—which I think would be better,—breeding the subjects of such an experiment, with animals similarly descended.

It is as certainly necessary that we should endeavour to find out the laws of nature in this matter, as that we should ascertain those which regulate her in the growth of our crops. Some of the gentlemen who have paid great attention to the pedigree of fine horses, and to breeding them, could doubtless afford us valuable information on this subject. It would at least be a source of amusement, to see a precise calculation of the quantity of Arabian blood in both the sires and dams of some of our noblest animals of this species. A. B. C.

THE NEW MANURE.—The manures which have been introduced in Scotland by Mr. Owen, of Copenhagen, and now creating so great a sensation there, are at length offered to the English agriculturist by Mr. E. J. Lance in London. The trials of the Animalized Carbon, which have been made by Scottish agriculturists, fully bear out the character given of it by the French, the Belgians, and the Danes. Two hundred and fifty tons are now said to be ordered by farmers in the counties of Forfar and Kincardine alone. The Quarterly Journal of Agriculture gives the following remarks and directions relative to this interesting manure:—"The chief excellence of this manure is, that it is powerful in its effects, occupies little room, is easily separated, and conveniently used either by hand or by drill. Its effects are further to insure a rich crop by gradually ameliorating the soil and rendering fallowing unnecessary. Half a ton is in general sufficient for an acre; light and warm soils requiring less, and cold stiff soils more than the average; but it is left to the farmer's judgment to make use of these directions according to local circumstances. It develops its effects so slowly and gradually that it may be supplied without danger in contact with the seeds or roots of plants, in which it differs from many manures which are less rich, but more heating. In Scotland it has been tried in 1854 on eight different soils, and has been found equal to bone dust, or sugar scum for turnips, and has since been ordered in large quantities from the manufacturer." There are two sorts of manure, Animalized Carbon, and a Fertile Mineral in union with Animal Matter.

A few days since a horse, belonging to a gentleman who was on a visit at a friend's house at Woodham Mortimer, whilst feeding on tares, was bitten severely in the mouth by an adder. The parts swelled to an enormous extent; but by copious cupping they were after a time reduced, and the animal has recovered. On examination of the tares, the poisonous reptile, a very large one was discovered, and it had evidently been severely bitten in several places by the horse.—A similar circumstance occurred on Monday week, at Bentley Mill, when the tongue of a valuable chaise horse, the property of Mr. Moss, was bitten by an adder. The swelling was so instantaneous, and to so great an extent, that it was at first apprehended the horse would be suffocated.

## ON THE FLY.

TO THE EDITOR OF THE FARMER'S MAGAZINE.

SIR,—I am induced to this communication by observing that the fly has began its usual attack on sheep and lambs; I have suffered by its effects on my flock and regularly used to buy white stone to destroy the maggots at this season of the year. This custom I have discontinued these two years past from using Baiss' Golden Fly Powder (as prepared by J. P. Ward, at his Cattle Medicine Warehouse, 47, West Smithfield.) I have for the last two summers escaped the ravages of this annoying insect, and by using this preventive have secured myself from former inconveniences attending the deposition of their lava. Many respectable graziers and salesmen are in the habit of using it, and I am glad that it is now being advertised, as its good effects have hitherto been confined to the few. At this present period of agricultural depression, I thought that a hint tending to the slightest diminution of expense, and having for its object to prevent suffering in the animal, would be acceptable to you and your readers.

I remain, Mr. Editor,

A CONSTANT READER.

June 10th, 1835.

## TO THE EDITOR OF THE NORWICH MERCURY.

SIR,—Agreeable to my promise, I now propose to communicate a few observations on my mode of cultivating the land which I occupy. At Michaelmas, 1834, I adopted spade culture for a crop of vetches, persuaded that it possessed advantages which would compensate me for the extra expense. Then it was a matter of opinion, now a subject of history. Now I know that it does possess advantages which has compensated me for the extra expense. The superior advantages of this mode of culture I find to be—first, my soil was cleared of weeds more expeditiously as well as more effectually; those which time would destroy were buried at the depth of ten to twelve inches for manure, others thrown on the top for burning. The second and most prominent advantage I found in the abundance of my crop, which far exceeded that of my neighbours who practice the common mode of culture by the plough. A third advantage I found in the employment of the poor; the 15<sup>l</sup> which I paid for digging 7½ acres of land being, as the overseer of my parish informed me, principally saved out of the poor's rate. In the first instance I paid 3d. per rod, or 2<sup>l</sup>. per acre. I have very lately been digging my land a second time for another crop at 2½d per rod, or 1<sup>l</sup> 13s 4d per acre—the soil being now free from weeds, except such as are buried for manure, and the digging less laborious—and I found that to the very bottom of the soil (ten to twelve inches from the surface) the roots of the vetches had penetrated. Common sense, independent of agricultural knowledge, is sufficient to decide, that if the roots of any plant or vegetable are checked at five or six (as by ploughing), where they will naturally penetrate through ten or twelve inches of soil, the crop

must be materially injured. In my next I shall state the quantity and quality of manure which I think most expedient.

In the interim I remain, yours truly,

A PRACTICAL AGRICULTURIST.

## HORSE SELLING.

A SCENE AT ———.—“Gentlemen, what can you hesitate about? Only look at her! She is one of the most beautiful creatures that I ever had the honour of submitting to your notice! So gentle in her paces—indeed so safe a goer, that a child might ride her. Her pedigree is excellent—she is thoroughbred from her ear to her hoof; and the Heralds' College could not produce a more sound and satisfactory one. She comes from a good house, I pledge my word, gentlemen. My Lord Duke, will you allow me to say 250<sup>l</sup>. for your Grace? She will, notwithstanding the excellence of your Grace's stud, be an ornament to it. She is a picture—complete to a shade; in fact, I could gaze upon her for ever, and always be struck with some new beauty she possesses. Thank you, my Lord Duke; I was certain your Grace would not let such an opportunity pass. There is not a horse-dealer in the kingdom who can show such a fine creature! She is above competition—I may say she is matchless! The Regent's Park might be betted to a mole-hill with safety that she has no paragon. Sir Henry, let me call your attention to Cleopatra! She is like her namesake in the olden times—but beautiful without paint! She is pure nature, and no vice! Her action, Sir Henry—yes, her action—you shall judge for yourself. Run her down, John. The Graces, I am sure, *Sir Harry*, were they to behold her movements, would be out of temper with their captivating excellence! *Taghioni*, I must admit, can perform wonders with her pretty feet; but *Cleopatra*, my Lord Duke, can *distance* the whole of them put together, and positively leave the Opera House, with all its talent, in the background. 300<sup>l</sup>., *Going!* 310<sup>l</sup>. Thank you, my Lord Duke, she must be your's. For the last time going at 310<sup>l</sup>. : I will allow you five minutes to compose your minds before you lose sight of this handsome creature. I do impress upon you to remember that the opportunity once lost—320<sup>l</sup>.; *Sir Harry*, I am obliged to you—the world has always acknowledged you as a man of great taste in matters of this kind; and, without flattery, you have never shown it more than in the present instance. *Going!*—*Cleopatra*, my Lord Duke, will be in other hands—a good bidding will make her your own for ever.—340<sup>l</sup>.—My Lord Duke, I can only express my gratitude by saying, that you have done me honour.—*Going!*—*going!*—in fact, gentlemen, I am like an artist in this case. I do not like to leave such a delightful picture, and I could *dwell* upon the qualities of *Cleopatra* to the echo that applauds again—but most certainly I have given you all a fair chance:—are you all silent? *Going* for 340<sup>l</sup>. What is that sum for one of the greatest English beauties ever submitted to the inspection of the public?—350<sup>l</sup>.—thank you, Sir Charles—worth your money at any price. I have witnessed your notice of *Cleopatra* for some time past—she will bear looking at again and again! I am glad to see she has so many suitors for her hand—I beg pardon, gentlemen—a slip will happen to the best of us—her *feet*, I should have said; but, nevertheless, I am happy to see she has a host of ad-

mirers. I cannot *bid* myself, or else I would 'make play,' and Cleopatra should become a noble prize.—370l.—Bravo! my Lord Duke! For 370l. positively, yes positively, 'pon my honour, positively the last time! You are sure, gentlemen, that you have all done? Don't blame me, blame yourselves! Going, *once!* Going, *twice!* Going, *three times!* [The auctioneer makes a long pause, and numerous flourishes with his hammer.] Gone!!! Cleopatra belongs to the Duke."—*Egan.*

## HAY AND STRAW ROBBERY.

TO THE EDITOR OF THE TIMES.

Sir,—In your paper of Tuesday is an account of the conviction of a person for selling a load of hay, every truss of which was under weight, and some very just remarks made by Sir Peter Laurie were also reported. Now, Sir, I do not know of a more crying evil than the one in question; the amount that the public is constantly plundered of is incalculable; a more nefarious system than the one now exposed does not exist, or one in which baser fraud is unblushingly practised. Being connected with an establishment in which a large quantity both of hay and straw is consumed, I can speak pretty accurately as to the truth of the statement, and at the present time, when both articles are at high prices, it is an affair of serious moment. My object in addressing you is to propose, through the medium of your excellent paper, a remedy, and I am sure if you think it a practicable one you will give it publicity. I would suggest that every farmer or other person sending hay or straw to market should have the weight of the waggon or cart legibly painted on the side. I would then propose that each hay-market should be provided with a weigh-bridge, and that it should be compulsory on salesmen, under a penalty of 10s for neglect, that every load of hay or straw sold should be drawn on and weighed previous to its leaving the market, and as it is very well known what a load of hay or straw should weigh, by deducting the weight of the waggon or cart you would be able to ascertain pretty nearly its correctness. I am aware that some little alterations would inevitably take place in the weight of the waggons and carts, from the accumulation of dirt, repairs, &c., but that would be a thing of no amount in comparison with the present system of wholesale robbery; and every farmer can without expense or inconvenience occasionally ascertain if any material alteration has occurred in the weight of the machines; at all events, I would make it his business and interest so to do, as, in the event of detecting a fraudulent statement, for the first offence the hay or straw should be forfeited; for a second, the cart also. To defray the expense of the weigh-bridge, &c., a toll of 3d or 6d. on each load should be paid by the purchaser, which I think he would be amply compensated for, and the clerks of the market might be charged with the proper execution of the plan.

I am, Sir, yours, &c.,

AN ENEMY TO FRAUD.

## COMPTON POOR RATE.

The following appeal was tried lately at the Hants Quarter Sessions:—

This was an appeal by Mr. James Comley and Mr. George Langridge, the tenants of two farms of Sir Wm. Heathcote, at Compton, against the poor-rate of that parish. The appellants complained that they were over-rated in the assessment in respect of their farms in comparison with the sum at which Messrs. Goldfinch were therein rated for their own farms. It was proved by two surveyors on the part of the appellants, that in their opinion, the lands in the occupation of Messrs. Goldfinch exhibited finer crops, and are superior in staple and quality to the lands of the appellants, and therefore ought to have been more highly rated. On the part of

the respondents, who are the churchwardens and overseers of Compton, it was proved by three eminent surveyors, and also by three gentlemen of great agricultural experience, that upon the average the lands of Messrs. Goldfinch are inferior in staple and quality to those in the appellants' occupation, and that it is by expensive and artificial means that the crops of Messrs. Goldfinch were rendered superior to those of the appellants. Here the court interfered, and stopped the further progress of the respondents' case, and thus a variety of witnesses, who could have proved that Messrs. Goldfinch's farms without artificial aid are naturally less productive than the lands of the appellants, were consequently not examined. The Chairman, in giving judgment in the appeal, stated that his mind had been long made up, it being his decided opinion under the act of parliament, that the staple and quality of the soil afforded no criterion of the annual value of it, which can only be ascertained by the appearance and value of the crop at the time the rate was made, and he therefore raised Messrs. Goldfinch's considerably upon the assessment, thereby laying down a rule that the agriculturists who, by employing a large number of labourers and making a great outlay of capital upon his farm, is to be rated in respect of the full annual value of the lands at the time the rate is made, without any allowance for the extraordinary expenses by which his farm has temporarily been rendered more productive than that of his neighbour, whose soil may be naturally better in quality though not so highly cultivated.

THE GREAT AMERICAN ALOE.—One of those sights which are said to occur but once in a century, the blooming of this plant, will shortly take place in a fine specimen of the variegated variety at the Surrey Zoological Gardens. It is believed to be about seventy years old. The crown of the plant opened on the 8th of June, and the flower stem has been growing at the rate of about four inches a day; it is calculated by gardeners that the stem will reach to the height of from 24 to 28 feet, and that the number of flower buds will be from 3,000 to 4,000, and that it will continue blowing nearly six weeks. The period at which the agave arrives at maturity varies according to circumstances; in hot or otherwise favourable climates it grows rapidly, but in cold regions or under the care of the gardener it requires the longest period that has been assigned to it, which has given rise to the popular error that the flowering occurs only once in a hundred years. A building is about to be erected for its protection and every care taken to accelerate its development. When having produced its gigantic flowers, and fulfilled the purposes of its existence, the plant perishes.

As an example of what the author of "*The Landscape Gardener*" conceives to be a perfect model of garden and park scenery recommended in the volume, he instances Luscombe, near Dawlish, the seat of Charles Hoare, Esq., brother to Sir Richard Hoare. Of this celebrated place he observes, that "it forms the closest copy of natural scenery as yet produced by means of plantation, in any part of the kingdom;" and that "any proprietor about to form a new place, would be abundantly compensated for the trouble and expense of a journey from the remotest district in the United Kingdom, to inspect every feature of this unrivalled production of fine taste." The view of such a place, deserving the encomiums thus bestowed on it, would be of the greatest use for instilling the principles of fine taste, and would also be a practical exposition of the writer's opinions as set forth in the volume we have just closed.

## POOR LAWS—IRELAND.

It affords us much satisfaction to be enabled to state that the necessity of introducing some system of Poor Laws into Ireland is beginning to be admitted in very many influential quarters, where but a short time since the utmost opposition was offered. On Thursday last the Duke of Richmond presented a petition from the county of Clare, in favour of making a provision for the poor. The Earl of Limerick availed himself of the opportunity to put forward the oft-repeated fallacy, that such a step would destroy the "charitable feelings" of the people of Ireland, and, moreover, added, that the Poor Laws had nearly ruined England. With respect to this latter proposition, we believe it is admitted by all those who have directed their attention to the subject, and more especially since a large body of important information has been furnished by the evidence and report of the Poor Law Commissioners, that it is not the existence of Poor Laws, as established by the Stat. of Elizabeth, but the abuse of them, which has led to the evil consequences resulting from those laws. The great defects in the administration of those laws are now discovered, and efficient means have been taken to correct them under the superintendence of the Poor Law Commissioners. Abuses which have been years taking root, must necessarily take much time to irradicate. The little experience, however, which has been already had, proves incontrovertibly that they are not irremediable. The objection which might have been urged against a system of Poor Laws as administered under the old law no longer exists, and the Irish nation will have all the advantages of the improved code in England. Mercy to the poor starving peasantry in Ireland, and justice to the British farmer and British labourer imperatively demand that not a moment should be lost in putting a stop to the scenes of destitution and misery which now desolate that fertile but unhappy country. The same journal which announced a few days since that 800 tons of potatoes had been imported into Liverpool from Ireland in one week, communicated the heart-rending intelligence that the inhabitants of some whole districts were either upon the verge of, or in an absolute state of starvation. In one parish in Dublin, consisting of 24,800 inhabitants, 18,000 are said to be in a state of destitution. Will the Earl of Limerick for an instant contend that such a number of individuals can be even kept alive by the contributions arising from mere private "charitable feeling." Experience shows the fallacy of the proposition that Poor Laws destroy all feelings of charity. Where? we would ask, have "feelings" of charity been more pre-eminently displayed than in England, ruined as it is said to be, by its system of Poor Laws. Is there a quarter of the globe in which suffering humanity has not received relief at the hands of a British public. Nay, have

not the poor-rate paying inhabitants of England been found ready, when occasion required, to contribute for the purchase of those articles of life which had been sent over to this country, and to cause them to be re-conveyed to Ireland for the use of their starving fellow-countrymen? And if any were found wanting in generosity upon such appalling and heart-rending occasions, have they not been the non-poor-rate paying landlords of Ireland, whose rents have been paid out of these self-same contributions. It is not, however, justice to the starving pauper-population of Ireland, but justice to the people of England, which requires that the owners of property in that country should support their own poor. The *Liverpool Standard* of last week, states, "that on the preceding Sunday the Irish steamers brought over 2,000 Irish labourers, all in the greatest state of destitution. The passage money is said to be only three-pence per head." These individuals come to this country to work if they can get it, if not, to beg. Should they obtain employment it will tend to pauperise the English labourer by reducing his rate of wages below the legitimate standard. If they are unsuccessful an additional contribution is levied upon the already over-taxed inhabitants of this country, who yet possess too much "charitable feeling" to see them starve in the streets unmoved. The changes which have taken place in the government of this country, and the protracted period of the session will, we fear, preclude the possibility of any measure being passed this year, but we are happy to perceive that the subject is taken up by some kind-hearted private individuals who are alive to the neglected condition of the Irish peasantry. We are not sanguine enough to think that an efficient remedy can be obtained by private exertion, but benefit cannot fail to arise from agitating the question. On Saturday a meeting was held at the Exchequer Coffee House, Palace-yard, to take into consideration "suggestions by Sir R. Sydney, as to the best means of employing Irish labourers, and for raising funds for that purpose without taxation." The meeting was not numerous, but highly respectable. Mr. Ruthven took the chair. Several resolutions were passed, and printed papers, setting forth the particulars of the plan, which consists in raising money by way of lotteries, were distributed to the meeting. It is thus developed by Sir R. Sydney himself—

"This plan is at once simple, practicable, and certain; and the relief, so essential to Ireland in her present deplorable condition, must directly flow from its three-fold purpose:—first, opening a wide field for the employment of the poor; next, making that employment conducive to their own future prosperity; and, thirdly, providing the means of defraying the cost of labour, without a charge upon the public purse, or an appeal to the bounty of individuals. In forwarding this plan, were it necessary to encounter difficulties, and were obstacles to be surmounted at every step, there would surely be enough in the exciting causes of country and humanity to urge every

reasonable sacrifice to overcome them; but so far from discouragements of any kind existing, facilities on the contrary, as will presently be seen, invite to the undertaking, and the way, as it were, is already opened to its execution. The public works whereon it is designed to engage the poor, and which demand attention in the first instance, could not be more auspiciously begun than at the present moment and, without reference to the immediate objects it is calculated to serve, or to the easy means of its accomplishment, it will be allowed to demand universal support on account of its own pre-eminent utility. In this view must be considered the project of forming railways in Ireland.

"It is impossible to enter here into details, or to expatiate on the comforts that would be communicated to the poor, the change that would be produced in their general condition, or the impulse that would be given to industry. Enough has been said to establish the necessity of employing the poor, and the last branch of the plan to be considered, is that of raising the necessary funds, which it is suggested can be readily done by the agency of a series of lotteries; and that the profits of the first should be applied exclusively for the improvement of the navigation of the Shannon, for assisting in the construction of railways from Kingstown and Waterford to Valencia, according to the proposed plans, and for draining the numerous bogs of Ireland."

Mr. Pearce Mahony observed, that the prohibition of lotteries in this country did not produce the desired effect. The money which Englishmen spent in gambling—if so it must be called—in lotteries, went into the pockets of foreigners instead of being made a source of profit for Englishmen. Tickets from the Continent were sold to a very large amount in this country.

A committee was appointed to submit the plan to the Chancellor of the Exchequer.

**THE SCARLET TREFOIL.**—MT. FOAKER'S DIRECTIONS FOR HARVESTING, &c.—As the time for harvesting the Scarlet Trefoil is now fast approaching, a few hints to those who have not yet had this work on their hands may not be amiss.—First as to cutting:—Now as neither this or any other crop comes to perfection the whole precisely at the same time, they must be taken when the greater and best part of the seed can be saved. When ripe, the seed will appear by the top of the capsule opening of a yellow or gold colour, and when one half has attained this state, do not wait for the other; for although this will retain a green hue, it will be good growing seed; and if this is waited for, half the other will be left in the field. After cutting, move it as little as possible, or the capsule will separate from the stem; and when raked in for carting, perhaps it had better be done in the dew of the morning. A gentleman said to me the other day, "With the utmost care, you leave so much in the field;" the reply was, "If you carry fourteen or fifteen bushels per acre out of the field, about fifty-five times what you carried in, do not grumble." It may be carted the third or fourth day after cutting (weather permitting;) but it must be placed directly under the flail or thrashing machine, and the cob thus separated must be left in heaps without moving, as it would consequently heat. In all other respects it is managed as our clover seeds, and will cost for cobbing and seedling about 4s. or 4s. 6d. per bushel. In regard to

seed time, and mowing, we have received some lessons this year that we shall profit by. The earlier after harvest the seed can be sown the better: our plan has been on the wheat stubble, consequently the fourth year after the fallow—there are, however, changes taking place from this system which I will notice presently. The land should be ploughed once only, harrowed and rolled sufficiently to have a surface mould of about an inch deep and solid at the bottom: there is no doubt that on tender soils it would be equally well without ploughing by only passing the harrows over once or twice; but as an autumn ploughing cleans and airs the land, it is preferred. The few failures that have taken place in this neighbourhood have arisen solely from two or three ploughings, the land not being sufficiently solid beneath; this is clearly proved in the very fields where the failures have occurred; for on the head-lands, where the ploughs and horses have turned and the land become solid, the plants have been perfect and luxuriant. But were this failure not so well accounted for, let the Agriculturist recollect the uncertainty of their other crops; how frequent are the wheats destroyed by mildew, blight, and yellow germ; the oats and barley swept away by the wire worm; the turnips cut up by the fly; the beans and peas ravaged by the aphid; and so frequently this occurs, that they have received the appropriate *soubriquet* of "lottery crop;" and as for our clovers, it has become a common expression in every farmer's mouth, "Our lands are tired—worn out with clovers." The Scarlet Trefoil on the contrary, is new to our soil, and the earth will kindly receive it into her bosom as a newly-adopted child.

## SIR THOMAS HESKETH'S ANSWER TO LORD STANLEY.

(From the Preston Pilot.)

Sir Thomas Hesketh requests that the annexed letter, in answer to Lord Stanley's, may be inserted in Saturday's *Pilot*.

Rufford-hall, June 17.

Rufford-hall, Preston, June 15.

My dear Lord Stanley,—Your letter of the date of the 10th of this month only reached my hands on my return home from Knowsley on Saturday, the 13th, which circumstance will account for any apparent inattention in your not receiving an earlier acknowledgement of it.

Permit me to assure you, my dear Lord, that as through life politics have never had the most remote influence upon my private conduct and friendship, so least of all can they possibly affect those sentiments of sincere regard and esteem which I entertain for your private character and worth, as well as for your public conduct and talents.

I have received, therefore, with grateful and corresponding feelings, and reciprocally acknowledge the assurance, that in addressing yourself to me you do so "as having been the chairman of that meeting (the meeting held on the 4th of June for the purpose of forming a Conservative Association for North Lancashire,) and as being the chairman of the permanent general committee, without any fear that a difference of opinion on the policy of the course now pursued will in any respect diminish the sincerity of our old personal friendship."

You do me but justice in this confidence in my friendship, and, in the same reliance upon yourself, I feel assured that you will receive what little I may feel myself called upon to say in reply to your letter in the spirit, and in the spirit only, in which it is written—as a question of public political discussion which you have forced upon me.

Though we may differ in opinion as to the means and measures by which the political constitution of Great Britain in church and state may be best maintained and secured unimpaired, no man, I am sure, can more cordially concur in the spirit of the "Declaration" on which the principles of the North Lancashire Conservative Association are founded, than your Lordship must do, having, as you have done, given such noble and disinterested proof of your attachment for, adherence to, and support of, the vested rights of that most important branch of that constitution, "The Protestant Church as by law established."

It is not my intention, indeed it would be impertinent in me to do so, to enter the lists of controversy with your Lordship, as the champion of the merits or demerits of the Conservative Associations; but individually I feel, and I believe I speak the sentiments of all who were present at the meeting in question, when I say, that they all felt and feel that such associations have been necessary and unavoidably forced upon the country—1st, by the baneful effects of the Reform Bill, constituted as the elective franchise by that measure is, a measure which I must differ from your Lordship in believing "was called for by the deliberate opinion of the country;" and, 2d, by the measures of the present Administration as now proposed, to despoil the rights of property both of church and state, in addition to those encroachments already effected by that Administration, when last in office, upon the institutions of the country.

I must be permitted to say that I feel it to be a somewhat extraordinary degree of inconsistency that they who, in the time of excitement, caused by the progress of that measure, invited and encouraged the nation at large to form "political unions" to carry, by popular clamour and by threats of physical force, their measures, should declaim against those who associate together to regain that legitimate influence in the great Council of the State which has been for a time wrested from them, but which influence is, I thank God, returning to them as the public mind becomes gradually disabused of the fallacy of those doctrines, which, as your Lordship justly observes, "The sophistries of ignorant or mischievous quack doctors in politics impose upon the ill-informed;" and while we assert our legitimate right to associate together to regain that influence and that just and fair representation in the Senate, we would also exert that influence in endeavouring to stem the torrent of those innovations with which the most sacred as well as civil institutions of our country are threatened. We uphold not abuses, nor blindly resist improvement.

Your Lordship asks, "And with regard to North Lancashire especially, where is the cogent necessity which calls for the formation of such a society? Are your objects general or local? If local, I ask, to which of us, to my hon. colleague or myself, is this hint addressed?" Our objects, I reply, are general; I disclaim on my part, and I take upon myself to disclaim on the part of the Conservatives of North Lancashire in general, any, the most remote, design or desire of injuring or weakening, even if we had the power, that popularity which has placed you in that honourable post which you deservedly hold as one of the representatives of North Lancashire; equally do I disclaim, if it can by possibility be requisite that I should do so, any other feelings than those of admiration and respect for your excellent and hon. colleague.

I must stand excused if I decline to enter into any argument upon the further general questions contained in your Lordship's letter; it is foreign to my habits of private life and retirement to obtrude myself in public controversy on the public notice, further than the necessity of the case in the present instance demands of me.

With all due deference and respect for the motives which have dictated your Lordship's letter to me as chairman of the permanent general committee of the North Lancashire Conservative Association, but which is, through me, intended of course to apply to all who compose that association, I will only add further, and I do so in justification of that

vast body of highly honourable, enlightened, and respectable men of whom it is composed, that the North Lancashire Association has for its object the very reverse of those political unions to which I have alluded, and the very reverse also of those results which you fear. Our object is—

Not that of "weakening" but of protecting "the prerogatives of the Crown."

Not of "undermining," but of maintaining "the independence of the House of Lords."

Not of "controlling," but of restoring and securing "the freedom of the House of Commons," enslaved as it now is under the domination of the Irish Agitator and his satellites.

Believe me, my dear Lord Stanley,

Yours very faithfully and sincerely,

T. D. HESKETH.

The Right Hon. the Lord Stanley, &c.

PICKLING OF MEAT. — Professor Refiensque denounces the use of saltpetre in brine intended for the preservation of flesh to be kept for food. That part of the saltpetre which is absorbed by the meat he says is nitric acid, or aquafortis, a deadly poison. Animal flesh, previous to the addition of pickle, consists of gelatinous and fibrous substances, the former only possessing a nutritious virtue. This gelatin is destroyed by the chemical action of salt and saltpetre; and, as the professor remarks, the meat becomes as different a substance from what it should be as leather is from raw hide before it is subjected to the process of tanning. He ascribes to the pernicious effects of the chemical change all the diseases which are common to mariners, and others who subsist principally on salted meat—such as scurvy, sore gums, decayed teeth, ulcers, &c.; and advises a total abandonment of the use of saltpetre in the making of pickle for beef, pork, &c. The best substitute for which he says is sugar, a small quantity rendering the meat sweeter, more wholesome, and equally as durable. This statement ought to be made known to all, and recommended to farmers, butchers, packers of sea provisions, and all the people who, owing to their residence from towns and villages, or to other causes, are in the habit of curing their own meat.

## ON SUMMER FALLOWING.

(EXTRACT FROM SINCLAIR.)

Exposition to the atmosphere is another advantage. The most stubborn, and unfertile soil, if exposed to atmospheric influence, will be improved in its texture, and rendered much better calculated for the process of vegetation. This is effected, either by the soil acquiring properties from the atmosphere, or by those substances which rendered it barren, being neutralized, destroyed, or washed away. The fact is that by no other means but by a complete summer fallow, can a wet bottomed clay be freed sufficiently of the moisture it has imbibed, which having been long locked up in the soil, holds saline and mineral matters in solution. These matters being discharged the soil readily imbibes fresh water, and gets into a mellow and fertile state.

By these means, the soil becomes more friable, the crops which it produces are vigorous, and abundant, and, comparatively speaking, free from weeds.

Some have suggested, that instead of a fallow, the land should be trenched. But even if hands could be procured, heavy clay, the soil which it is alone necessary to fallow, is seldom fit to be dug, as the rain makes it too compact in winter, and in summer the heat makes it too hard. In Flanders where so much land is trenched, light soils are preferred for that operation, and it is frequently done by the shovel instead of the spade\*.

The expense, and the practicability of substituting a crop in its stead, are next to be considered.

The expense attending this process is considerable. It must vary according to the amount of the rent, and the number of ploughings, harrowings, &c., but the following is considered to be a fair average statement.

|                                                       | Per Statute Acre. |
|-------------------------------------------------------|-------------------|
| The six ploughings, harrowings, &c. cost .....        | £3 11 0           |
| Rent for two years, at 2l 7s per acre per annum ..... | 4 14 0            |
|                                                       | £8 5 0†           |

Besides these sums, the expense of the crop to be raised, and its share of the manure, required for the whole rotation, have to be added. But the advocates for fallowing maintain, that these ploughings, and the rent of the land while in fallow, ought not to be charged against the subsequent crop, but to the whole

crops in the rotation, as they are all, in a greater or lesser degree, benefited by it.

From the objections urged against a summer fallow various attempts have been made in Scotland to omit it, but hitherto unsuccessfully. Beans were tried, and they are certainly well calculated for strong soils, being an excellent preparation for wheat. When drilled, they enable the farmer in some measure to keep his land longer in a clean state, than could be done were that operation to be omitted. Yet their culture cannot prevent fallow from being necessary at certain periods, when the land becomes foul and hard by cropping. Potatoes, planted on part of a fallowed field where the soil was favourable, with a greater allowance of manure than the naked fallow, proved so severe a crop, that the part cultivated with potatoes, yielded a less crop of wheat, than the ground that had been fallowed:—the after crops on the fallowed part, were likewise more abundant; and the land much cleaner in the end. Swedish turnips were also sown early, and taken off the field in September but the soil was found to be so much exhausted by that root, that the succeeding crop of wheat was less than the usual average.

On this subject, so far as respects Scotland, it may be proper to add, that a great reduction in the frequency of fallows, has already taken place, since the introduction of the turnip husbandry on light land; and though on the clayey adhesive soils above described, they can hardly be ever totally abolished, in that part of the united kingdom, yet there is ground to hope, that in process of time, circumstances may occur, which may prevent the necessity of recurring to them, even so often as is requisite at present. The climate may improve as cultivation is extended;—by more effectual draining, and the frequent additions of lime and dung, the texture of the strongest soil will be altered, and necessarily become more of a loamy nature,—by repeated cleanings, the quantity of weeds of all descriptions, must be greatly lessened;—instruments also may be invented, which may prove more effectual for cleansing and pulverizing the soil, than those at present in use;—new plants may likewise be discovered, or a more advantageous mode of cultivating old ones may be introduced: and it is impossible to foresee, what improvements may be effected by draining: in consequence of which, the cultivation of wet and strong soils may be facilitated, and either stock may be fed upon the ground, or its produce may be removed with less injury. But till these alterations take place the Scottish farmer will not easily be induced to relinquish the advantages he derives from a well executed summer fallow.

## ENGLAND.

The climate of England is certainly superior to that of Scotland; yet even in that part of the kingdom, many respectable authorities consider an occasional fallow to be necessary.

Mr. Marshall states, that if land be in a state of foulness with root weeds, (as half of the old arable lands of the kingdom may be said to be,) a year's fallow is the shortest, the most effectual, and the cheapest way of cleansing it. He also accounts it the best preventive of the wire worm. All herbivorous insects which have not the power of flight, at least in their early states, are best extirpated, by keeping the soil which they inhabit free from every thing herbacious, especially during the summer months, when they are in a state of activity, and doubtless require daily support. In that case, abating tillage must prove their destruction.

\* The expense of trenching, in Flanders, are calculated as follows: 1. Light lands, eighteen inches deep, 1l. 6s per acre; 2. Strong land, eighteen inches deep, 1l. 11s; 2d per acre; 3. Strong land, two feet deep, 2l. 5s per acre. In those parts of England, where men are to be found accustomed to dig, light land would be trenched at 3d per perch, or 40s per statute acre; and even strong land, at the rate of 4d per perch, or 50s per acre.

† In the Appendix, No. VIII, there is a detailed account of the expense of fallowing, on the improved system of the Lothians, from which it appears, that the expense is greatly diminished by the use of the scarifier or grubber. In England, the fallow ploughing is seldom begun so early as it ought to be nor in cross-ploughing attended to, without which the process is imperfectly done. The ploughings should also be carried on in the dry seasons, being better calculated for the destruction of root weeds.

In Kent, they have what are called autumnal fallows, in which way the stubbles of fallow crops are prepared for wheat, by several ploughings and harrowings. Barley also is sown late, that it may be thrice ploughed, and operate as a cleansing crop; but after all, the intelligent reporter of the Husbandry of Kent, (Mr. Boys), states, that there are some untoward soils, which all the art and industry of man can not keep clean and in good order, for any considerable length of time, without a fallow; that cold and wet clays, if they were tolerably clear from weeds, are subject, after two or three crops, to run together to become exceedingly stiff, and to require the intervention of a summer fallow to mellow the soil; that a good summer fallow is the best preparation for a crop of clover; and that the course of, 1. Fallow; 2. Barley; 3. Clover, or beans; and 4. Wheat, which is the system most practised in the Isle of Thanet, is there considered to be, the foundation of all good management. In Essex, fallowing is thought essential, especially for barley. In some parts of the country, half the arable land is under a dead summer fallow; in others, a fourth, a fifth, or a sixth; but the practice is universal, except on dry turnip soils. Mr. Cheere of Cambridgeshire is convinced, by much experience, that a perfect clean fallow is indispensable every four, five, or six years. It is necessary however that all the requisite ploughing should be given in dry weather.

That celebrated Norfolk farmer, Mr. Overman, gave a strong proof of his concurring in that opinion, for entering upon a farm, where some fields were full of spear grass, and other weeds, he gave the outgoing tenant £5 10s per acre, for the privilege of completely fallowing them. He cleaned the ground thoroughly by four ploughings. The soil was sandy, on which a hot July sun destroyed the root weeds, without raking or burning. Such are the effects of climate.

The Reporter of the Husbandry of Staffordshire, (Mr. William Pitt,) explains, in an able manner, the advantages of summer fallows; acknowledging, at the same time, that he had once been a sufferer, by too implicit a confidence in the opposite theory. He says, that fallowing for wheat, is practised by the best farmers, on cold, wet, or strong lands; and that he who shall attempt to manage such land without fallowing, will most probably find his mistake. Fallowing is there necessary, because the roots of perennial grasses, such as couch grass, &c. cannot otherwise be sufficiently weakened or extirpated; nor can any attempt at extirpation be so successful, by any other means, as by repeated deep summer ploughings. It appears also, from the Derbyshire Report, that whenever the soil is strong, clayey, adhesive, and wet-bottomed, many intelligent farmers in that district, approve of summer fallowing.

There is a most striking coincidence between these and Mr. Boys's remarks, and the doctrines already detailed on the importance of fallows, from farmers residing in Scotland, though there could not be any previous knowledge that they followed the same practice, and approved of it on the same grounds.

Mr. Curwen also states, in a recent publication, that the practice of fallowing the more distant parts of his farm, has, with great reluctance, been adopted by him. This practice he considers both requisite and beneficial, in so wet a climate as that of Cumberland, where it is wholly impracticable, in all seasons, to make green crops so free from couch and other weeds, as is necessary for the successful cultivation of the succeeding crops, particularly those of clover.

But as the system of fallowing is condemned by authors of great eminence, in reference to southern districts, as either rarely, or not at all admissible, even on strong soils, we shall briefly state their sentiments upon the subject.

Mr. Young only admits a fallow during the first course, advising it to be rejected the second course, and ever afterwards.

Mr. Marshall is of opinion, that when land is once thoroughly cleansed, it may, by fallow crops, and due attention, be kept so for a number of years, and more especially, that where the farmers attend so particularly to the seed and vegetating processes, as in the Vale of Gloucester, a whole year's fallow judiciously made, will be found sufficient to keep land in a state of tilth and cleanness, for ten, fifteen, or perhaps twenty years. In another work he maintains, that after an eighteen months' fallow, land may be so effectually reclaimed, that it would not require a repetition of the operation of fallowing, for half a century afterwards.

But the author who most decidedly disapproves of the summer fallowing system, is Mr. Middleton, the Reporter of Middlesex. Instead of a naked fallow, he recommends a crop of winter tares, which may be obtained in perfection before midsummer. It is the nature of this crop, he observes, while growing, to render the soil more mellow, than is done by a fallow. It tends to enrich the land, by retaining the air stagnant while the crop is growing; and when the crop has reached maturity it supports and fattens the farmer's stock. Green tares may be given in racks to cattle and sheep upon the land, if the season permits, or in fold, fixed in convenient parts of the fields. By either of these modes, the soil is abundantly fertilized by their dung and urine. The arguments in favour of a naked fallow, arising from a clay soil and a moist climate, are thus in a great measure obviated, in districts where winter tares will thrive, and where they run no risk of being destroyed. As they delight in a moist climate, and, as in England, they come to maturity in June, and require to be taken off the ground during the driest months in the summer, the farmer has all the months of July, August and September, to render his land as clean as a well-conditioned garden, and as fertile as he can desire.

MR. FOAKER'S ACCOUNT OF THE SCARLET TREFOIL.—The following gentlemen are growers of the Scarlet Trefoil in my own immediate neighbourhood:—Mr. Blyth, Thorp, tenant to J. M. Leake, Esq.; M. Baker, Kirby, farms upwards of 800 acres of land under—Barber, Esq.—Hunt, Esq., and—Turner, Esq. Mr. Hicks, Walton Hall: Mr. Hicks, Little Clacton; Mr. Lenny, Thorp; Mr. Orpen, ditto, tenant to—Bennett Esq.; Mr. Mumford, Kirby Hall; Mr. Pertwee, Thorp Park; Mr. Salmon, Beaumont Hall, tenant to Guy's Hospital; Mr. Pearson, Horsey Island, tenant to—Blanshard, Esq.; Mr. Stone, Kirby, proprietor; Mr. Wrinch, Holland, tenant to Rev. J. Kirby; Mr. Wrinch, Little Clacton; Mr. Warner, Kirby, tenant to—Hume Esq.; Mr. Wright, Thorp, ditto; Mr. Wilson, Walton ditto. Here are sixteen gentlemen, who farm between four and five thousand acres of arable land, practical men, bred up to agriculture from the time they could reach a plough handle. The first question I put to them was, excluding three pieces of the Scarlet Trefoil which failed in consequence of two or three ploughings in the Autumn—Will the rest cut three tons of hay per acre on the average? Thirteen of the sixteen said

they had no doubt but it would ; the other three said, two tons and three quarters, certainly. 2nd. Question—What will the Red Clover cut per acre, for hay ? it was unanimously agreed it would not average one ton on the same farms : several assured me that they should not have half a ton.

### ANECDOTE ILLUSTRATING THE HAZARDS ATTENDING SPECULATIONS IN FARMING.

Several years ago, a very ingenious person, the inventor of some useful machines, for which he had taken out patents, but from which he did not derive the profits he had expected ; and who found also, that the profession he followed, (that of a writing-master,) produced but a moderate income, formed an idea, that he could make his fortune, by an improved mode of cultivating the soil. With this view, he took up his residence in the neighbourhood of Edinburgh, where he purchased eight Scotch acres of land, from which by means of his new system, he expected to derive an income of 1600*l* per annum. His plan was, to plant 5000 gooseberry bushes per acre, making in all 40,000 ; and in the interstices between the bushes, to raise cabbages and other vegetables, by the sale of which he expected, to be enabled to defray, both the expenses of the cultivation, and the interest of the money he had paid for the ground. He admitted, that no profit could be made till the fifth year, when the bushes would come into full bearing ; but he calculated, that though the bushes were reduced from five thousand to about four thousand plants per acre, yet that each bush, on an average, would produce three Scotch pints, which, (making allowances for the rivalry of other cultivators), he would be able to sell at the rate of fourpence per pint, or one shilling per bush. Thirty-two thousand bushes, therefore, even at that low price, would produce 1,600*l*. per annum. Hence the plan, seemed to him certain of success. It was in vain that his friends pointed out an objection which he had not taken into his consideration, namely, the hazard of not finding a market for such a quantity of the same article. He was too sanguine to admit of any difficulty in effecting a sale. The event however proved, that the difficulty anticipated, was perfectly well founded. The gooseberry bushes produced an abundant crop ; and both the quantity and quality of the fruit exceeded his most sanguine expectations. But the occasional inclemencies of the season,—the numbers destroyed by the boys and women sent to pull them,—the circumstance, that a large proportion became ripe early at the same time,—and the fruit being of so very perishable a nature, that it could not be preserved in a perfect state for above a day or two,—all combined, to render the plan unsuccessful ; and a very small proportion of the crop, under these disadvantages, ever came to market. He was reluctantly compelled therefore, to extirpate the gooseberry bushes and to try some other expedient.

He had heard of the great value of a crop of carrots, when produced on ground properly manured and cultivated ; and he determined to sow his eight acres with that root. The carrots thrived, and, to all appearance, were an excellent crop ; but when raised to be sent to market, a large proportion of them were diseased, having got the distemper called "*Fingers and Toes* ;" and nobody could be found to purchase them.

Still, however, he was not discouraged ; and being unwilling entirely to lose a crop, from which he had

expected to derive so much profit, and having heard that carrots contained much sugar, and consequently afforded a great deal of nourishment, he bought an immense quantity of poultry, invented machines for scraping, boiling, and washing the carrots, and fed his poultry with them to a remarkable state of fatness ; but, alas ! even these were not marketable ; for although he sold a few of them, nobody who once bought them, would purchase them again ; for their flesh appeared to be quite raw, even when well cooked, in consequence of their having been fed on sored a substance as carrots.

It is much to be regretted, that so ingenious and persevering a character, should have experienced so many disappointments ; and it will be admitted, that the plans he tried, were sufficiently plausible to justify his making the experiments above detailed. Perhaps the gooseberry experiment might have been more successful, had he converted the fruit into wine, which, when properly made from that fruit, is an excellent and wholesome beverage.

### STATE OF THE POOR IN LIMERICK.

(From *Inglis's Ireland*.)

But there are objects of a far different nature, in the old towns of Limerick—objects of a deeper, and more melancholy interest. The reader will recollect, that in Cork, Waterford, Kilkenny, and in other towns which I have visited, I have made it a part of my duty to inquire into the condition of the poor ; and having been informed by those upon whom I thought some reliance was to be placed, that I should find more and deeper destitution in Limerick, than in any place which I had yet visited, my inquiries in Limerick were prosecuted with all the care which I was capable of bestowing ; and I regret to say, that I found too dreadful confirmation of the very worst reports. I spent a day in visiting those parts of the city, where the greatest destitution and misery were said to exist. I entered upwards of forty of the abodes of poverty ; and, to the latest hour of my existence, I can never forget the scenes of utter and hopeless wretchedness that presented themselves that day. I shall endeavour to convey to the reader some general idea of what I saw.

Some of the abodes I visited were garrets, some were cellars ; some were hovels on the ground-floor, situated in narrow yards, or alleys. I will not speak of the filth of the places ; that could not be exceeded in places meant to be its receptacles. Let the worst be imagined, and it will not be beyond the truth. In at least three-fourths of the hovels which I entered, there was no furniture of any description, save an iron pot—no table, no chair, no bench, no bedstead ;—two, three, or four little bundles of straw, with, perhaps, one or two scanty and ragged mats, were rolled up in the corners, unless where these beds were found occupied. The inmates were some of them old, crooked, and diseased ; some younger, but emaciated, and surrounded by starving children ; some were sitting on the damp ground, some standing, and many were unable to rise from their little straw heaps. In scarcely one hovel, could I find even a potato. In one which I entered I noticed a small opening leading into an inner room. I lighted a bit of paper, at the embers of a turf which lay in the chimney and looked in. It was a cellar wholly dark, and about twelve feet square ; two bundles of straw lay in two corners ; on one, sat a bed-ridden woman ; on another, lay two naked children, literally naked, with a torn rag of some kind thrown over them both. But I saw worse even than this. In a cellar which I entered, and which was almost quite dark, and slippery with damp, I found a man sitting on a little sawdust. He was naked, he had not even a shirt ; a filthy and ragged mat was round him ; this man was a living skeleton ; the bones all but protruded through the skin ; he was literally starving.

In place of forty hovels, I might have visited hun-

dreds. In place of seeing, as I did, hundreds of men, women, and children, in the last state of destitution, I might have seen thousands. I entered the alleys, and visited the hovels, and climbed the stairs at a venture; I did not select; and I have no reason to believe that the forty which I visited were the abodes of greater wretchedness than the hundred which I passed by.

I saw, also, another kind of destitution. The individuals I have yet spoken of were aged, infirm, or diseased; but there was another class, fast approaching infirmity and disease; but yet able and willing to earn their subsistence. I found many hand loom weavers, who worked from five in the morning till eight at night, and received from a task master from half a crown to four shillings a week. Many of these men had wives and families; and I need scarcely say, that confinement, labour, scanty subsistence, and despair, were fast reducing these men to the condition of the others, upon whom disease and utter destitution had already laid their hands. The subsistence of these men consist of one scanty meal of dry potatoes daily.

I will only add one other instance of destitution. Driving in the neighbourhood of Limerick, on the Adair road, in company with a medical gentleman, the apparition of a man suddenly appeared by the side of our car. The gentleman who accompanied me knew him; he had been a stone breaker, but had become infirm, and at length utterly disabled by disease, from labour; his cabin was close by, and we ascertained, that he and his family had subsisted, during the last three days, on the leaves of that yellow flowered weed which grows among the corn, and which is boiled, and eaten with a little salt. I think I have already mentioned the use of this weed for a similar purpose, by the destitute poor of Kilkenny, or if I have not, I ought to have done so.

I think it is impossible for me to select a better opportunity than this, to advert briefly to a topic, on which I have not hitherto offered any direct observations. I allude to the disputed question, whether there be, or be not, a necessity for some legal provision for her poor; and I confess, that with such scenes before me as I have at this moment, it does seem to me an insult to humanity and common sense, to doubt the necessity to which I allude. I might carry the reader back with me, to gather arguments from Kilkenny, Waterford, Cashel; and, indeed, from almost every town, village, and hamlet, that has lain on my way; but the situation of the poor at Limerick is at this moment fresh in my memory; and I ask any man of ordinary intelligence, whether such a state of things can or ought to be allowed to continue? Why should Lord Limerick in Ireland, be exempt from the duty which Lord Limerick, in England, must perform? Why, under the same Government, should men be allowed to starve in one division of the empire and not in another? I mention the name of Lord Limerick, not because I suppose he, or any other man can prevent pauperism on his city property; but because when I inquire who are the individuals that contribute to keep the bodies and souls of these miserable creatures together, and when I ascertain that many a humane citizen contributes more than the noble owner of all the property, then I perceive there is some wrong; and,—that leaving for a moment the question, as it relates to the poor, out of consideration—justice demands, that in the ratio of their abundance, men should be forced to contribute.

**A GOOD IRISH LANDLORD.**—The landlord, Lord de Vesci, built neat cottages for a number of paupers, several of them outcasts from other estates, who had found an asylum in some lodging houses in his lordship's village of Abbeyleix. They had no claim upon him beside that to which he has never turned a deaf ear, the claim of suffering humanity. They were intruders upon his estate, but he has now made them denizens by establishing each in a comfortable residence, with a garden attached, at a yearly rent of *one shilling*. They enjoy the privilege of cutting turf for their own use and for sale without any additional charge, and the ground which is thus reclaimed by their

labour is appropriated to their use for the growth of potatoes, oats, or any other crop that may be raised upon it. A large portion of land has been thus brought into cultivation, and the persons whom the inhabitants of Abbeyleix a few years ago regarded with alarm and suspicion, are now amongst the most orderly and comfortable of our peasants. Every one of them is master of a good house, abundance of fire, a well-cropped garden, with a field or two annexed, and some who have been more industrious, or more successfully so than their fellows, have even achieved that first step to independence—a milch cow.

## WATTON FAIR

Is another among the many proofs that have occurred of the triumph of utility and perseverance over party prejudice. It is now some six or seven years ago, (as Mr. Hastings stated after dinner), since this annual fair was established through the instrumentality of that gentleman, who was immediately assisted in his attempt by the recommendation and personal attendance of Mr. Coke. Whatever was likely in the least degree to forward the interests of the farmer, and to elevate the science he so fondly loved, has always found a warm supporter in purse and in person from the proprietor of Holkham. To have the semblance of utility is amply sufficient—any agricultural project has always been perseveringly pursued until its merits have been ascertained and a fair time for trial has ever been afforded before it has either been discarded or adopted, when the whole world was always free to reap the benefit of Mr. Coke's experiments.

Such has been the mode pursued with Watton Fair, in spite of insinuations and open assertions that the object of Mr. Coke was a political one. Turning neither to the right or the left—pursuing an even path, certain of the benefits the fair would confer upon his beloved science, and upon the farmers, in conjunction with its supporters, this first of agriculturists has continued annually to be present. On Wednesday, July 1, Mr. Coke arrived from London about twelve o'clock, and immediately proceeded to the fairstead, where an equally numerous, if not more numerous show of cattle, sheep, and lambs than at that of last year, were exhibited. Those which attracted the most attention were some pure and some crossed Hampshire tups and shearlings and two-shear sheep, shown by Mr. Saul from the flocks of Lord Berners. One of the tups, a pure Hampshire shearing, attracted considerable attention, from its size, fatness, breeding, and symmetry—all however that were exhibited by Mr. Saul from his lordship's property were greatly and deservedly admired. Mr. Dawe had a pen of by far the finest lambs in the fair; they were sold at very high prices; we heard as much as two guineas having been offered and refused. Mr. Russell's lambs were very good, although not equal to those of Mr. Dawes'; lambs, generally sold freely. Soon after two o'clock a party of upwards of eighty agriculturists sat down to an excellent dinner, in a booth erected on the bowling-green of the George Inn. Mr. Coke presided, and was supported at the right hand table by W. L. W. Chute, Esq., and at the left by A. Hamond, Esq., W. Birch, Esq., Master Edward Coke, Master Henry Coke, and the Rev. P. Gurdon, were present. Among the agriculturists were—Messrs. H. Abbott, Boyce, Boughen, Edward, Thomas, and Wm. Farrer, Hudson, jun., Hart, Hastings, Land, Ling, March, Milne, Morse, Oldfield, Palmer, Russell, Stebbings, T. Saul, S. Tut-tell, Wrightup sen. and jun., Waller, &c., &c. Mr. Land was Vice-President. The following toasts were given:—"Constitution and King"—"The Duke of Sussex and the Royal Family"—"The Navy"—"The donor of the venison, Lord Walsingham"—"The Bishop of Norwich"—in whose name the Rev. Philip Gurdon returned thanks in brief but expressive terms "Prosperity to the Fair."

Mr. HASTINGS, in allusion to this toast, declared that the farmers were deeply indebted to the Chairman,

for the powerful support he had given to the Fair from its commencement. To him they owed its prosperity—another proof that whoever Mr. Coke upheld, was almost certain to prosper, for through the countenance the President had given it, and the example he had set, it was fast rising to a Fair of extent and interest. Mr. Hastings concluded by proposing “The Health of Mr. Coke.” The toast was received with the loudest cheering.

MR COKE, in expressing his acknowledgements, declared that nothing could afford him more satisfaction than the gradual progress which the fair was making, and at the statement Mr. Hastings had given of the increase of stock. It had been said that in the establishment of the fair a political object was in view. Had that been the case he would not have come to it, and it would perhaps a little surprise some gentlemen when he said that upon looking at the poll book he found that only one of the original promoters had voted for him. His object in assisting in the establishment of the fair was the promotion of agriculture, that first of all sciences. He looked to meetings like the present as the best means of causing a more extended intercourse among each other, and by promoting a better knowledge of their neighbours, to unite all parties on such occasions. He was rejoiced to see gentlemen that day who had never before been present, and he earnestly hoped they would continue to join these and similar meetings. There were occasions when it was quite right for every man not to shrink from the assertion of his political opinions, but that time past, it was best to throw a shade over them. He must again express the pleasure he felt at the union he that day saw of all opinions, and he hoped that nothing would fall from him to destroy the unanimity that prevailed. (*Cheers.*) Mr. Coke then entered into several statements relative to sheep, and expressed his determination so long as God granted him health, to preside at that fair.

“The Lady Anne Coke,” by the Vice-president. MR. COKE acknowledged the toast.

“The Vice-president, Mr. Land,” who returned thanks and gave “The Heir of Holkham,” for whom Mr. COKE returned thanks, and said that although at Eton his son had not forgotten Watton fair.

“The Lord Lieutenant of the County.”

“The Health of Mr. Chute, of Pickenham, as a most excellent landlord and friend to agriculture,” by Mr. Hastings. MR. CHUTE in acknowledging the toast, regretted that he had hitherto not attended the fair. *Mr. C. agreed in the evil attendant on mixing politics with agricultural meetings like that, and was of Mr. Coke's opinion, that the oftener such meetings were held, the more would the better feelings be brought into play among agriculturists, and knowledge communicated that would be advantageous to all. He knew it had been the intention of other gentlemen to but they had been called elsewhere. He hoped that the fair would proceed with increased prosperity,*

MR. COKE again expressed a wish that gentlemen of both opinions in politics should meet and lay aside all party distinction, making the benefit of agriculture alone their object. The Hon. Gentleman then alluded to his first turning his attention to agriculture, and proceeded to show that at the sheep shearings at Holkham, gentlemen of all parties had always taken a part at those meetings. He was happy to see Mr. Chute on this occasion, and he hoped that gentlemen would bring others. Nothing approaching to politics had ever been the object—that alone being the dissemination of information and promotion of good feeling and conviviality.

“Mr. Hamond,” That gentleman also returned thanks, expressing his pleasure at seeing the Chairman of Mr. Bagge's Committee there—nothing would be more likely to rub off the sharp edges of political feeling than such meetings.

The healths of Mr. Birch and the Rev. P. Gurdon were also drank, and each gentleman acknowledged the compliment.

The following toasts were afterwards drank.

“The Hon. G. Milles and the Norfolk Fox hounds”

—“Prosperity to the Yarn Factory in Norwich”—“The County Members”—“The Tenantry of Holkham,” which was acknowledged by Mr. H. Abbott—“Mr. Milne,” who spoke at considerable length on various agricultural subjects. Several discussions were debated in the course of the evening, which space will not allow us to enter into. About eight o'clock Mr. Coke left the chair, and soon after departed for Holkham. The arrangements were exceedingly creditable, and the meeting gave the utmost satisfaction.

#### TO THE RIGHT HONOURABLE THE CHANCELLOR OF THE EXCHEQUER, MR. SPRING RICE.

Sir,—The reformed House of Commons, under a Whig ministry, has declared by two large majorities, that the Agriculturists, admitted on all hands to be on the verge of ruin, have to expect no relief at its hands. You, sir, the Chancellor of the Exchequer, have unequivocally declared, that bruised and broken as we are, blind chance must decide whether we are ever again to raise our heads, or for ever perish. This, sir, is the interpretation every man must give to the speeches of yourself, and your honourable colleague, Lord John Russell. The question, the mighty question, whether the tenantry of England are longer to exist as a class of society, has been put to you and the reformed House of Commons, twice within the space of eight days, by the Marquis of Chandos and Mr. Cayley; you have virtually decided that they are not, you have come to the bold resolve of abandoning agriculture, now sinking beneath the burden of unequal taxation and the vascillating policy of successive administrations.

I cannot, without the most fearful apprehensions, picture to myself the Chancellor of England's Exchequer, looking calmly on the chief pillar of a mighty fabric, bending, yielding to the weight of its uneven load, and whose certain and speedy fall must overwhelm, in one common destruction, the fellow pillars of the edifice, superficially appearing to enjoy an immunity from the pressure, which forces the great mainstay to the earth; I am lost in utter astonishment at the seeming indifference with which this most momentous subject is treated; and in order sir, that you may not hereafter plead a want of correct information as to the actual state of the farmer, I beg you to bestow a few minutes on the subjoined debtor and creditor account of a stock farm of fair quality: I say stock farm, because I am aware many half-informed people suppose, that because sheep and wool are realising a much higher comparative price than corn, that stock farmers have no cause of com-

plaint; you will please to observe, sir, that I have not, like Sir Robert Peel, ransacked Mark Lane for the highest price of wheat, barley, or oats, but that I have put the former at the average country price, and the two latter articles at what they would realise under an average produce, it being notorious to all that both have this year fallen short full one-third of the usual produce, so that 25s for a full crop of barley is more than equal to 31s, the present average, and so in proportion in the oats. I have also given the farm credit for producing more than three-fourths of my agricultural friends will admit can be obtained; I have debited it below rather than above its constant liabilities, and now will proceed to figures:—

## FARM, FIVE HUNDRED ACRES, ARABLE.

Such, sir, is the situation of the farmer under what are supposed to be comparatively favourable circumstances; here is not a shilling charged for house-keeping, unless it should be argued that the last item of 50l should be partly charged to that account; what then must be the condition of those occupying the vast territory of acres, confined almost exclusively to the production of corn? from figures there is no shifting; here is my statement, and I dare all the ingenious calculations of political economists to controvert it; I ask then, are you satisfied merely to follow up the recommendation of the misinformed agricultural committee, "by trusting to the forbearance of parliament, rather than to an active interference?" Will the forbearance of the surgeon to staunch the

wound pouring forth two ounces of blood while the system makes but one, save the patient from certain speedy death? or is it matter of indifference whether the patient in this case sink or recover? In quite as great probability will the human patient recover under the circumstances, as your state-patient, agriculture, under the system of forbearance alone. It is a great misfortune, however classical, poetical, or eloquent, that the college productions, which constitute so large a portion of our statesmen, are so little acquainted with the true practical part of the affairs of the country; with pain I am bound to express my conviction that they are a long march behind their constituencies in this indispensable acquirement; many of us humble persecuted clodhoppers saw in 1819, that this forbearance, which you never dreamt of until 1833, when we were ruined, was then imperatively necessary. Had "forbearance" been exercised towards the productive classes, by "forbearing" to pass that devastating measure, called Peel's Bill; had we not by its operation been compelled to pay a double quantity of produce in the discharge of every engagement entered into in a paper currency (more particularly affecting the agricultural class who were tied to payments of rent and tithes for terms of years, while the trading community, having withstood the first shock, and disposed of their goods in hand, which on an average might be taken at six months' consumption came to us, the producers, and bought at the reduced prices this bill had brought about, we still producing under paper money, rents, tithes, &c., during the continuance of our leases for many years after), you, sir, would not have beheld such a balance sheet as the one I have now presented you.

"Forbearance" would have been effectual, if timely, but is it any profit to forbear loading our beast, when he is prostrate at our feet, unable to rise with the load already on him? utterly exhausted, his load must be left to the mercy of the wayside, or borne by another, unless protection and nourishment be immediately afforded.

If, sir, the landed interest is worthy of thought, if the collection of the rents of the aristocracy, the tithe of the clergy, the very existence of country tradesmen, the welfare of the labourer, and the consequent ill or well being of the public treasury, be objects of solicitude to the Chancellor of the Exchequer, instant and extensive relief must be afforded the tenantry of England, and believe me, sir, it must be of a far more comprehensive nature than your contemplated reduction of county rates, abolition of statute duty, or church rates (though just in principle), can ever afford. In your speech on Mr. Cayley's motion on the 2nd instant, I find the following passage, "Was this the time for England, the first of all nations in a commercial point of view, to set an example to all who lived within its dominions, and to the nations of the earth, for the first time in her modern history, of a violation of faith?" With all deference, sir, I maintain the example has already been set, I am prepared to prove that vested rights have been most unjustly interfered with, that public faith has been shamefully violated towards all the debtors and productive classes of these kingdoms; I am myself an occupier of land and a joint owner of a small estate, which was let some few years since; this land came into the possession of myself and another, the two youngest of the family, subject to a mortgage made in 1818, then supposed to be half the value of the farm, to pay off two elder branches their equal share of the property; the tenant with justice applies for a reduction of rent, truly stating that he is paying full half of it from his capital, which

must soon be exhausted. Your reduction of county, church, and highway rates, may ease him from 15 to 20 per annum; will he thank you for it? can I relieve him to any thing like the extent required, without becoming a beggar myself, seeing the mortgagees demand the same interest, now that the farm is worth only 250*l* per annum, as when worth 500*l*? the then value of half the farm, is now the value of the whole; the elder brother and sister have had their share in money, placed it in the funds, and are called public creditors; but I and my other sister are not acknowledged by such a gracious title, are told that Peel's Bill having deprived us of the whole of our property, "forbearance" of further wrong is all we can hope for! Such, sir, is the situation of half the landed property in England. Can you, can the House of Commons recognise no breach of "national faith" here, no interference with "vested rights," no violation of the sacred rights of property? or is it incompetent to break faith with others of his Majesty's subjects than the privileged orders of the stock exchange placemen and annuitants, or do you acknowledge no "vested rights" but those which an insatiable hierarchy claims on every improvement and outlay of embarked capital, on the produce of the sweat and toil of the goaded and despised labourer? An important rise in the price of produce, or a vast reduction of tithes and taxation must instantly be effected, or it requires no argument, further than the statement I have the honour to lay before you, to prove that there can be no other than a labouring tenantry in England; the capital of the present race of tenants, either is, or is about to be annihilated; will another race embark in agriculture at one-third of the present rents, with everything to fear and nothing to hope for? Assuming that such can be found, can landlords with upwards of 60 per cent. reduction of rent, pay the interest on their mortgages or family claims, established in a paper currency? can any other than Irish or Polish serfs afford to pay them sufficient rent to enable them to meet these claims? Such being found, what is to become of the innumerable multitude pauperised by the abstraction of the two hundred and eighty thousand agricultural families from the face of society? what of the customs, of excise, deriving such an immense revenue from their and their dependents' expenditure? I humbly submit, sir, these are questions worthy your immediate consideration.

You have many weighty affairs on the carpet; the Irish Church question, the municipal reform question, are both important, but compared with the consideration of the agricultural distress, they both sink into insignificance, and that, sir, however unheeded our voice, the winter of 1835-6, with wheat at 5*s* per bushel, will too fully convince you.

Like many Whigs and Tories of my acquaintance, you may exclaim, I admit your distress, but where is the remedy? Undoubtedly, a country, as an individual, deeply involved, requires the aid of great prudence, skill, and foresight, to prepare for the liquidation of its various liabilities, but I venture to affirm that there is less want of remedies, than of disposition or courage to carry them into effect.

You fear to repeal the malt tax (arguments in favour of which I would desire no stronger, than I find in Sir Robert Peel's speech against the repeal), and thereby do an act of justice to laborious industry, annihilate many temptations to immorality, and very materially benefit the farmer, because you stand in awe of the money-mongers of the stock exchange, or some other wealthy portion of the public, seeing that they must be called on to make up the deficiency, by paying their just taxation. You allow the Irish

landlords to starve their countrymen out of Ireland, and compel them to inundate this country with their untaxed and comparatively untithed commodities, for the purpose of raising their grinding rents, not to be expended on Irish produce, but upon the produce of every other clime under the sun.

You compel the English tenants to bear the charge not only of the general objects of parish relief, but of the superfluous able-bodied labourers, thrown out of employment by the combined influence of the influx of starved Irishmen into the labour market, and the existence of general distress, a charge neither reason or justice can sanction, it being as much at variance with every principle of fair dealing to compel the agricultural interest to employ or support superfluous hands, as it would be to compel a gentleman to keep two footmen or coachmen, where one only was required.

Moreover, you continue the iniquitous tithes' system, giving the wealthy Church every advantage of the increased skill and industry of the farmer, and more particularly of the superfluous labourers, without its contributing one shilling in carrying into effect the improvements arising from the application of their skill, industry, or superfluous labour, which Church since the year 1750, has added to its revenues the tithe of seven millions of acres of land, converted by the capital of agriculturists from barren heaths into fertile fields.

You allow the titled, wealthy, aristocratical portion of the community, a comparative immunity from taxation, the weight of which falling with such overwhelming force upon the lower and middle classes, renders them incapable of consuming the products of the land, while the higher orders expend incalculable sums, directly or indirectly, derived from British soil by British labour, on foreign superfluities, which sums, if taxation were equal, would remain in the hands of the consumers of home produce.

These, sir, are a few of many subjects, the consideration of which might, in my humble opinion, be entertained with advantage by a reformed parliament. The idle cry of robbing the public creditor, when we pray for the removal of cruel and partial taxation, the senseless balderdash of "vested rights," when we humbly ask that the spirit of our constitution, in church and state, may be strictly abided by, will no longer avail. If it was no "breach of faith" to compel every debtor by the passing of Peel's bill, to pay his creditor double what he borrowed; if it was no "breach of faith" with the tenantry of England, thrice in nine years to alter the corn laws, while they were bound to discharge rents and tithes covenanted for under the higher protecting scale of 80*s* per quarter for wheat, and 40*s* for barley, passed immediately on the restoration of peace; if it was no violation of the sacred principles of justice to compel us to ransack our pockets for the support of labour we needed not, or our brains and pockets for improvements, of which the grasping tithe law gave the church the benefit, surely it can be no "breach of faith," to call on the favoured fundholder to take in liquidation of his claims, the same paper, or its value that we borrowed, or to acquiesce in a fair commutation of taxation.

The body to which I belong, sir, is firmly attached to the institutions of the country, both of church and state, in their original purity. It knows that under these, when untainted by their present many abuses, England has seen her happiest days; but it is with the families of nations, as with the families of men; loyalty must not be altogether unrequited any more than filial love and attachment. When a child has honoured his father and mother, done all in his power

to minister to their wants and increase their comfort, the law of heaven and of earth forbids that he should be treated with churlish indifference; his just and reasonable requests must be attended to. In this situation are we, the farmers, our persons and purses have always been at the service of our country in the hour of its peril, either when threatened by foreign enemies or assailed by intestine commotions. In the ever memorable year of 1830, we stood in the gap between an infuriated peasantry and its intended prey, the aristocracy and clergy; by physical efforts and raising their wages, we quenched the wildfire of rebellion, which in its sudden fury threatened to level with the dust, the mansions of the country gentlemen. Is here no claim for consideration? was here no sacrifice to be repaid by a country's gratitude? blazed there no fires in our stack-yards, the beacons of revenge diverted from their first aim, the aristocracy, towards us, who had taken the burden from their shoulders? Whether you now think so or not, sir, these will be found to be grounds on which we justly lay claim to protection and relief; we have been ever given to understand, and have ever hoped, that the reform bill, of which you Whigs boast the parentage, was to have been the means to an end of eradicating corruption, enforcing economy, and of shifting the burden of taxation from the shoulders of the sinking productive classes, to the shoulders of the unproductive rich, so much better able to bear them; this was the cry of reform candidates in every canvass, and well I remember the honied words of our members for North Hants, when comparing the claims of the Reformers with those of the Tories, on the suffrages of the constituency; what, said they, will you not accept the proffered boon? a reforming ministry, with economy, reduction of taxation, *the malt tax, for instance, and abolition of tithes?*\* We, sir, groaning under Tory chains, seized the gilded bait, and returned two professing reformers; but, alas! the thought of reducing tithes and taxes perished with the hour which seated our men in parliament. Experience has now convinced us, that the difference between Whig and Tory, exists but in name; there is yet a golden opportunity of immortalising yourself and party, not by shifting the question, or cowering to the arbitrary will of despotic oligarchs, but by turning a ready ear to the just and earnest importunities of a suffering and hitherto patient, yet powerful body, the agriculturists of England. It is now the eleventh hour, the cancerous bill of Peel, in its slow but sure progress, has nearly reached the vitals; in your hands is the remedy, and I beseech, I implore you, while it is called to-day, to apply it; if neglected, his most gracious Majesty's speech to another parliament, in place of sympathy, may contain expressions of unavailing regret, connected with and arising out of the utter annihilation of hope in the long suffering farmers, and the confusion consequent upon their irretrievable ruin, the destruction of a link in the chain of society, to repair or find a substitute for which will never be in the power of either Whig or Tory tinkers, is the humble, yet decided opinion, of, sir,

Yours, most respectfully,  
A NORTH HANTS UNPOSTATIZING  
REFORMER.

THE LABOURER IN IRELAND.—Let me now in a few words sketch a year of the life of an Irish labourer. I allude particularly to those of the

province of Connaught; but the same description may be given very generally of the entire country. In the beginning of spring he takes, from a neighbouring farmer, a portion of con-acre according to his means, from half a rood to half an acre; in it he usually sets potatoes, (though some, at times, in a small portion of it, sow corn.) When this is done the cabin is shut up and the family separate. The husband goes to a distant part of the country, or to England, to obtain employment; the wife and children go to a distant parish to beg, from a shame of being beggars where they are known, and are supported during the summer by the charity of the farmers and cottiers, and at times obtain small sums of money, which help to make up the rent of the cabin and con-acre. At the end of harvest all return to their home; if the husband has been successful in his efforts to obtain employment the rent of the potatoe ground is paid. The potatoes are dug out, and upon them and a little butter-milk when it can be procured, the family live in perfect idleness during the winter. Yes, I repeat it, the Irish peasant lives in perfect idleness during the winter, solely, I assert, because there is then no way in which his time and labour can be turned to advantage. It would be worth the consideration of the legislature how well those long and restless nights, restless because following days of inaction, are fitted for the purposes of the incendiary and the villain, and what effect this periodical idleness must have upon the character of a people whose situation is frequently so very wretched, and is always so precarious.—*O'Flynn's Present State of the Irish Poor.*

#### SHEEP SHEARING.

On Tuesday, June 23rd, a competition for three prizes, to be awarded to the persons who sheared a sheep each in the most skilful manner, took place at Earl Spencer's farm, at Chapel Brompton, near Northampton. Nineteen competitors for these prizes appeared, and the prizes were awarded.

1. To Edward Bagshaw, of Great Hawarden, near Wellingborough.
2. To Jeremiah Pavin, of Dallington, near Northampton.
3. To Joseph Timms, of Abthorpe, near Towcester.

The first prize was seven sovereigns, the second five sovereigns, and the third three sovereigns.

#### ADULTERATION OF BREAD WITH ALUM.

—By the 1 and 2 Geo. IV., cap. 50, sec. 6, it is enacted that bakers, either journeymen or masters, using alum or any other unwholesome ingredient, and convicted on their own confession, or on the oath of one or more witnesses, shall forfeit not exceeding 20*l*, and not less than 5*l* if beyond the environs of London. Justices are allowed to publish the names of offenders. The adulteration of meal or flour is punishable by a like penalty. Loaves made of any other grain than wheat, without the city of London and its liberties, or beyond ten miles of the Royal Exchange, to be marked with a large Roman M.; and every person exposing such loaves without such mark shall forfeit not more than 40*s*, for every loaf so exposed,

\* These identical words were uttered at the hustings, by the present members.

## ON WEEDING LAND.

FROM SINCLAIR.

Preventing the soil from being injured by weeds, is attended with much greater difficulties than are commonly imagined. It is not only important to free the cultivated soil, by every means that can possibly be devised, from those destructive intruders, and to prevent their growth, in grass lands, in plantations, and in commons, but also on the sides of roads, in hedges, or wherever they are to found.

It is the more necessary to attend carefully to this subject, as the powers of propagation, which have been imparted by nature in this description of plants, render it extremely difficult for farmers to prevent their growth. Many of them are propagated both by their roots and their seeds. Some plants extend their roots so far under ground, that it becomes extremely difficult to dig them up. In some instances, new plants spring up from every joint left under ground. Others stretch out runners or stolons every way above ground, and to a considerable distance, while many plants from their seeds with wings, by means of which they are scattered about by the wind in every direction and frequently to a considerable distance. These are so dangerous as to require, not only partial attention, but general efforts to have their future progress arrested, by cutting them down wherever they are to be met with, before or as soon as they have flowered.

From a perusal of the County Reports it appears that both in England and in Scotland, weeding is too much neglected: though, in several districts, since the introduction of turnips and other cleansing crops, with row culture, and a more correct mode of fallowing, the ground is kept much cleaner. But still on many farms, weeds continue to occupy a considerable proportion of that surface, for which the farmer annually pays rent and taxes; and by their growth, the production of useful articles is considerably lessened.

In discussing this subject, it is proposed to consider—the various sorts of weeds;—the descriptions of lands in which they are respectively found, and how they may be eradicated; the instruments made use of in weeding;—the expense of the process;—the means of preventing their increase;—the civil or legislative regulations which would contribute to their destruction;—and the advantages which would ensue, were their extirpation accomplished.

## 1. OF WEEDS IN GENERAL.

Weeds are commonly divided into three classes—Annuals, which continue only one year, the plant dying after its seeds are perfected; Biennials, which continue two years, and die after maturing their seeds the second year; and Perennials, which continue in existence several years. Many of these are propagated both from the root and from the seed.

These different sorts of weeds are found in corn fields;—in grass lands;—in hedges;—in waste and uncultivated lands;—and in woods and plantations; and even gardens, notwithstanding the care bestowed on their culture, are not exempted from them,

1 Corn-fields.—In a list given by an intelligent author, of the weeds which infest our corn fields, no less a number than *fifty-five* are enumerated.\* For-

\* See Mr. William Pitt's Essay on the extirpation of Weeds, in the Communications to the Board of Agriculture, vol. v, p. 240.—In Marshall's Gloucestershire, 77 are enumerated.

tunately their extirpation can in general be accomplished, by nearly the same processes.

The most effectual means of ensuring their destruction, on strong land, is by a clean and complete summer fallow; or on light soils by the culture of turnips, potatoes, or tares, in rows, and kept perfectly clean; but for the attainment of that object, it is necessary, 1. To bring the seeds within the limits of vegetation; and 2. To destroy every weed which vegetates.

1. Seeds of an oily quality, such as those of charlock or field mustard (*raphanus*, *raphanistrum*, and *sinapis arvensis*), and several other annuals, will remain for a long period of time in the ground, capable of vegetation, when acted upon by moisture and heat. It is absolutely necessary, however, to make them germinate, before their destruction can be effected. This is accomplished by the operation of ploughing, harrowing and rolling, by which the ground is pulverized, and a vast number of seeds are brought so near the surface, as to promote their vegetation. In fallowing, those processes should be performed early in the season, when the powers of vegetation are the greatest, and the weeds most likely to come forward.

2. When the first crop of weeds appears above the surface, a second ploughing should be given, by which that crop will be instantly destroyed, and a foundation laid for producing another crop of weeds. Harrowing, and were there are clods, rolling should also be resorted to, after every ploughing; and in this way, several crops of weeds may be destroyed, in warm and moist seasons, before the succeeding crops are drilled. During the growth of those crops, both the hand and the horse hoe should be constantly employed; and the greatest care taken, to prevent all weeds from running to seed.

As the several hoeings given to the cleansing crops, destroy every annual weed as fast as it appears, if the seed-furrow, for the crop which succeeds, be not ploughed or scarified deeper than the last furrow given to the cleansing crop, (and a greater depth is then unnecessary,) few weeds will appear in the crop of grain which follows, but as the clover stubble, which follows the grain crop, must be ploughed a little deeper than the seed furrow formerly given, a fresh growth of weed may then be expected. To get the better of these enemies, some farmers hand weed these crops, at an expense of from ten to twenty shillings per acre, and have found it much to their advantage; while others have resorted to the drill husbandry, and in that manner have been enabled to destroy them in a satisfactory manner.

By an attention to these measures, the quantity of weeds is regularly diminished; and many farms, which forty years ago, were a nest of seedweeds, are now brought into such order, that these injurious plants no longer materially impede the growth of corn.

*Perennial Weeds.*—It is much more difficult to eradicate perennial weeds, as several propagate both by their seeds and their roots. Under this head are comprehended, all the sorts which come under the general name of couch, (*triticum repens*). These are among the greatest banes that husbandry has to contend with. They are sometimes so interwoven in the soil, when it has been negligently cultivated, as to form a species of matting. Their destruction can only be effected, by an early and complete summer fallow, when, by repeated ploughings, with sufficient harrowings between each ploughing, the roots may be worked out, and brought to the surface.—The scarifier or grubber, and some recently invented har-

rows, are of peculiar service in extracting the couch, after the land has been completely pulverized. Besides collecting the roots by these instruments, it is an excellent practice, to gather them by hand-labour, employing boys and girls to follow the plough, and to pick up every root as fast as it is turned up. When collected, the roots should either be burnt, or deposited in a large heap, and mixed with lime, and thus may become the basis of an excellent compost.

It is proper to observe, that the destruction of root weeds, as couch, and of seedlings, as charlock, must be effected, in arable land, upon different principles; the former, by working them out of the soil, so as to induce the seed to germinate after the rain, and afterwards ploughing in the young plants.

### REMARKABLE INSTANCE OF MAL-ADMINISTRATION UNDER THE LATE POOR LAWS.

From several parishes of—in the county of —, a petition was forwarded in November last, to the poor law commissioners, for the formation of a union. On the most experienced of the assistant commissioners repairing to the spot, he was received with acclamation by all classes of society; but without any reason being known or assigned, a strange prejudice seemed everywhere to exist among these amorous parishes, against any matrimonial connexion with the parish of A. The Mayor of the most influential parish in the proposed union, assured the commissioner that he would do anything to facilitate the project, *provided* his dominions were not to be united with the said parish A. Go where he would the commissioner met with the same request, the blooming parishes all saying, “we will do anything you want, but PRAY don’t unite us with parish A!” No one, however, had any reason to assign, except that so often used by man against his neighbour—namely, that he was a being much more demoralized than himself.

The commissioner listened to these objections with respectful suspicion, but on directing his attention to the common enemy, he found that during the last five years four members of parish A had been hung—that nine had been transported for fourteen years—and that the number of convictions in proportion to their population had trebled that of any of the contagious parishes. With a population of 850, the poor rates amounted to 1,300 a-year, being about 17 11s 6d per head on the number of inhabitants!

On inquiring who might be the overseer, the commissioner learnt that this UNPAID individual had virtually reigned ten or eleven years; that he lived at his farm-house, and was himself a large landholder. On calling upon and demanding an inspection of the parish books, the overseer appeared confused, and said he would send for them, but Mahomet insisted on going to the mountain, and accordingly the commissioner and the overseer proceeded together to a large shop (in the village) on *the counter of which* lay the volume. This shop was kept by the overseer’s brother, who was also his servant, and on passing the threshold it was evident to the commissioner that he had reached a bazaar of considerable importance. Three hundred loaves were sitting on the shelves—more than two sheep were hanging in joints—bacon, groceries, and draperies of all sorts filled up the interstices—and with these articles arrayed in evidence before his visiter, the officer confessed,

that besides being overseer of the parish, he was a farmer, a miller, a baker, a butcher, a grocer, a draper, and a general dealer in all sorts of provisions and clothing. With this scene before his eyes, it was impossible for the commissioner to help silently comparing in his own mind the thriving business of the overseer, with the profuse expenditure and hectic symptoms of the parish funds; and indeed the parochial books as they lay on the counter seemed to hint that between the parish account and the shop account, there existed a consanguinity—in fact that they were cousins barely once removed. A few days afterwards the commissioner unexpectedly appeared at the vestry, held as usual at the public house, and as soon as the pipes and ale were finished, the business of the day commenced. As the paupers successively appeared, their cases were heard, and in every instance they were desired to attend “*at the shop*” the following morning, when the decision of the vestry would be communicated to them—this had been the constant practice.

On arriving at “the shop,” the pauper was freely permitted, if he chose, to receive the whole of the relief ordered by the parish for his support, IN MONEY; but odd as it may sound, he generally found out that somehow or other he happened to be in debt at this very shop—and by all of his class moreover, it had long been remarked that they were dealt with by the vestry according to their docility at the shop. The sum of 1,200*l* a-year, transferred from rate-payers to rate-receiver, had thus annually passed over the overseer’s own counter; and if as was generally said, his goods had been sold at 40 per cent. above the usual price, it was not surprising he had made no complaint against the inconvenience of such an arrangement.

The overseer himself confessed that the paupers were sometimes in his debt for half a-year’s wages, but as on his counter there was also lying the book of ‘casual relief,’ the parish was the shopman’s security, and so what the vestry did not decree to his creditors, he himself had the honour to award!

The overseer besides thus picking up the crumbs which fell from the rich table of the parish, was also the proprietor of fourteen cottages, the rent of which was paid by the parish, that is to say, by himself to himself.

It may appear strange, and “passing strange it is,” that this man should have managed to maintain his influence in the vestry; but the paupers becoming *dependent* upon him, in proportion to their insubordination and degradation, these aggressions were successfully urged by him as a plea for gaining the confidence of those whose concurrence he required. In short he had the entire control over the collection as well as distribution of the rate; and when the little shop-keepers became indignant at seeing their fair-dealing profits thus absorbed by their overseer, they were bribed to silence by being left out of the rate altogether; nay even the *vicar of the parish* honestly declared to the commissioner that though but too well aware of the existing oppression, he also had been left out of the rate, on the distinct understanding that he was not to interfere in any of these concerns. In fact so completely was the overseer triumphant, that he had even dispensed with the ordinary form of making a rate, but when he wanted more cash he laconically stuck on the church door the following official notification:—“A rate wanted.” In obedience to this mandate, “a rate was granted,” and the said rate was collected by his brother

and servant, who was also the paid servant of the parish.

As samples of this man's conduct to his inferiors, the following cases may be selected:—A member of parliament, who is also a magistrate, informed the commissioner that a parishioner of parish A who lately applied to him for relief, stated that he had been working for a considerable number of weeks (not on the parish account), for the said overseer, nominally earning 10s a week; that during so long a period, 'never having seen the colour of his master's money,' he at last ventured on a Saturday night to ask for *two shillings* instead of wages of the shop—that his request was granted, but that he was discharged—and thenceforth all parochial relief denied him.

A man with his family, consisting of a wife and four children, solicited permission to live in a hovel belonging to the parish, with an understanding that he should pay no rent, but should support himself by his own exertions. He performed his contract—until at last a small sum was requested and allowed him for the maintenance of his ninth child, an idiot. The poor man kept his dwelling in tenantable repair, and for eighteen years spent his earnings in "the shop." At length having ascertained that half-a-crown would go elsewhere as far as four shillings *there*, he deserted "the shop;" however, no sooner did the small stream of his earnings cease to flow over that counter than a Sheriff's Officer demanded from him the sum of 4*l*, for forty weeks' rent in arrear—the debtor was insolvent, and his very bed was sold to satisfy his creditor. On hearing this tale the commissioner again inspected the overseer's books, and he there found, in *his own hand writing*, a single charge of 46*l* 10s for rents paid *by himself to himself*!

The above case duly attested, being forwarded to the poor law commissioners for England and Wales, they deemed it their duty to order that this overseer should instantly be dismissed. No sooner did he fall from his exalted station, than the base feelings which his own demoralizing system had created unkindly turned upon him; among the lower orders there was left no sentiment of generosity to pardon his errors—no disposition to overlook his frailty—no creditable reluctance against trampling on a fallen foe—the poor wretch fell a victim to vices of his own creation—his life became a burden to him, and with very great regret we add, he has just ended his career by suicide. —*Quarterly Review*.

## PAROCHIAL AND STATE PENSIONS.

SIR—I lately attended a vestry meeting, held for the purpose of reducing the expenditure of a parish in this neighbourhood, where a general feeling prevailed among the paymasters, chiefly farmers, that, as provisions were so much reduced in value, and they, in consequence, so much less able to pay the rates, a proportionate deduction ought to be made in the pensions to the parish paupers. This resolution was accordingly acted upon, and a considerable reduction effected. Viewing, however, the age and infirmities of many whose pittances were lessened, I could not help regretting the necessity of the case, and considering with how much greater propriety the measure might be applied to the State pensioner. On referring to some old papers and recent bills, I gathered a list of a few articles that are in general use, with their prices towards the end of the war and at the present time (some of

them I subjoin),—but wearing apparel, house rent, and all other necessities, as well as wines and luxuries, are also much diminished in value since the former period,—so that at least £25 per cent. may be considered as a fair reckoning for the decreased cost of a family establishment. If, therefore, the salaries of all officers, who are even usefully employed, were to be adequately reduced, if unmerited pensions were to be lopped off, and useless sinecures abolished, would not such an amount of saving be effected, that the Minister might be enabled to remit some of the most oppressive taxes, and thereby afford relief, however slight, to the distressed agriculturists and the overburthened members of the community in general?

Another point has often occurred to me, that, without going into a minute calculation, the country received the value of 60 bushels of wheat on an average for the amount of Stock created during the war, taking the £3 per cents. at £60. Now, if the people were able to pay off the debt, or a part of it, they would be required to supply 360 bushels of that grain to each holder of £100 £3 per cent. at the present time. The doctrine of an equitable adjustment I would not enter upon were I capable; but I think that, were the original purchasers of the stock in all cases the present holders, there would be no injustice in obliging them to take an equivalent in proportion to the present worth of wheat, or, at least, of provisions in general. This property, however, has so much changed hands, and at so many different prices, that there appears to be great difficulty in fairly meeting the case. One thing, however, is certain, that the people of this country have had a heavy burthen to bear, and which, I fear, they must still sustain; it, therefore, behoves the Government to alleviate their distresses by the adoption of rigid economy, and the promotion of just and good laws. List of articles with their prices, above alluded to:—

|                                  | About 1813. | 1835.   |
|----------------------------------|-------------|---------|
|                                  | £ s. d.     | £ s. d. |
| Malt, per bushel                 | 0 15 0      | 7 0     |

Leadbury, June 17, 1835.

J. Y.

## THE POOR RATES OF FROME.—A REMEDY.

We have always maintained that the Allotment System, which we designate the Cottage System, would entirely relieve this country from the pressure of poor-rates, except for the aged and impotent. We have frequently adverted to the present condition of certain parishes, where we have been enabled to come at particulars, and shewn the competency of the land to maintain its population, and the capability of the people, if allowed a portion for cultivation, of keeping themselves above the disgrace of dependence on parochial pay. We have never found, nor has any one ever pointed out, an instance where the theory could be disputed, or where its practical adoption has failed. If anything remains to make the truth more evident, it is the citing of such places as, from the great amount of their poor population, are the least

likely to offer so beneficial a remedy to the extent required; for this purpose we have made enquiries relative to the parish of Frome, which is a town of importance in respect to its trade, and has a population, according to the return made to the Poor Law Commissioners, in 1834, of 12,240 souls. Either from the falling off of trade, or the loss of employment on the part of the working manufacturers, in consequence of its being monopolised by a few masters—say two or three, instead of fifty or sixty, as was formerly the case—or else from both of these circumstances combined, the labouring portion of the people are in great poverty, and nearly one-sixth of the population are actual paupers. The total receiving relief, including those who are in the workhouse, amounts at the present time to 1,922, for maintaining whom, the rates levied on the inhabitants in the year 1834, amounted to £9,475, of which about £7,478 were collected, the deficiency being occasioned by poor, voids, &c.

Every one will readily admit that, if it were possible to remove from the inhabitants so burthensome a tax, a great good would be effected, but how much greater would the good effected be in respect to the paupers themselves! It is quite evident that, in this country, crime has increased in proportion to the poverty of the people; and that the moral character of the English labourers and peasantry shews a powerful contrast to that which it was before the enclosure of small farms, and the depriving the labourers of their pieces of garden ground, common privileges, &c.; and we may rationally infer, that if the peasantry and the whole of the labouring people be not restored to their former condition, education, religion, temperance societies, &c. will be of no avail. Education is a good only when those who receive it are in a condition to make it useful; it is of no use to give religious instruction without enabling the people to practise it; and all advice of a moral tendency, and all institutions for the promotion of virtue, temperance and honesty, will be fruitless, unless those whose benefit is designed thereby be placed in a position where their moral good will be of some advantage to them—where they will have a command over their offspring—have powerful inducements to industry and economy, and feel sensibly alive to the advantage of integrity on the part of themselves and children. While a great portion of the labouring poor are paupers, and of those who are not, scarcely any are to be found who have been enabled by their exertions to accumulate sufficient for more than a few weeks lodging and food—they lose every inducement to economy, and therefore have no motive to refrain from spending their idle hours in the beer-house; and the motive to industry and economy being lost by the impossibility of bettering their condition thereby, is the main source of the intemperance and crime which have not pauperised the people, but which are the results of their poverty.

Much greater good, then, in behalf of the poor would be effected by reducing this burthen, than in behalf of those on whom it falls.

Frome is one of those places where a remedy has been sought by getting rid of what is called the surplus population; and very probably, a remedy will be sought in the adoption of the New Poor Laws—in the Malthusian system of imprisonment for poverty; but the second case will be as deceptive as the first. First of all, what good can emigration do to Frome? If of the 1922 paupers they send off only the able-bodied, they will be able to make a diminution in the number of 110, for 1812 of

the paupers are not able-bodied. And, secondly, what object will be gained by the imprisonment and separation of man, wife, and children system? The disabled must be maintained; and therefore neither terror, or cruelty, or coarse food will induce them to leave the parish. By coarser food, the expenditure may be somewhat, but so triflingly reduced, as to be hardly worth the experiment on this account.

If a remedy to the gaunt evil of pauperism be wanted, even in Frome, that remedy is to be found in the land, where the fabled treasure still remains undiscovered—a fortune for all. The 1,922 paupers divided into families of 5 each, would amount to 384, for which 150 acres would be ample to relieve the parish from the cost of every pauper capable of working occasionally. The obtaining of this land cannot, we should think, be a matter of difficulty in a parish containing 8,000 acres let at a rental whose average is less than 30s, the prime pasture land not exceeding 40s. It may be asked, what good would this do to 1,922 paupers, of which only 110 are able-bodied? We can only answer by asking what the disabled did when the poor rates, in no parish of an equal population, exceeded one quarter their present amount? The fact is, that then every honest labourer felt it the greatest disgrace that could attach to him to have his parents or a brother in the workhouse: children and parents were knit together in a common bond of gratitude; the children, prospering by their industry, were the props of their parents in old age. It will require a generation to pass away before the poor can be again restored to this high feeling of integrity and affection; but it is none the less necessary that we should immediately adopt the means which give a certain prospect of its being ultimately effected.

What is wanted in Frome and other places is not that the poor should be maintained at a less expense, but by the profit of their own industry; it is necessary for the good of the poor, and for the welfare of the nation, that less should be paid in the shape of poor-rates, and that more should be paid in the shape of wages. There is wanted in Frome not a reduction in the number of hands: bad as the trade is, only 110 able-bodied men out of 12,240 are receiving parish pay; we may therefore conclude, that 500 hands could not be spared; what is wanted is a diminution of redundant labour—that is, a means of employing, profitably, that labour which the master does not want, and occupying occasional periods when trade is slack. This redundancy should be reduced to such an extent as to enable the labourers to obtain higher wages. In proportion as the labourer obtains higher wages, and the whole of his time is profitable to him by working for himself when his master does not want his services, will he rise in the moral scale; he will be dependant on his own exertions—his children, like olive branches, will add to the produce of his toil—every family will become a school of industry; the cottage will be a comfortable home; there will be no inducement to squander time in the beer-houses; no time for idle habits either for parents or children; there will be every inducement to attend faithfully to the duties of life, and no other inducement will be strong enough to entice men from their duties.

If this plan were adopted in Frome, the poor, instead of being a burthen, would be an advantage; instead of deeming it necessary to expatriate our labourers, (the most valuable portion of the community,) we should find them the support of the home market—giving a fair price, and honestly

paying for our redundant produce, of which redundant produce, the farmers and manufacturers complain as much as rate-payers do of redundant population. Instead of being a tax on the shopkeepers, our labourers would then be the customers of the shopkeepers—millions would be earned and expended in furnishing their present comfortable cottages, and in renewing their present tattered garments.—*Bath Journal*.

## CULTURE OF POTATOES.

TO THE EDITORS OF THE LEEDS MERCURY.

GENTLEMEN,—Having read in your last week's *Mercury* a few lines on the causes of the failure of Potatoe crops, wherein the writer states that salting them by the Lincolnshire growers was the cause of that failure. Although it might possibly be the case with him, I am very much in doubt of its general application, as the crops have failed in different places, for which the Lincolnshire men have nothing to answer. I am induced to lay before the public through the medium of your widely extended Journal what I conceive to be the principal cause of the failure of the crops of this most useful of all roots, and also the method by which a crop may, under Divine Providence, be with certainty relied on. The importance of the subject must be my apology for obtruding my opinions on the public, and for all defects of grammar or phraseology. I humbly hope it will be taken with the same spirit it is written, a desire to do good to my country, and especially to that class to which I belong, the labouring poor.

During the time I had the charge of the gardens of the Rev. J. A. Rhodes, of Horsforth Hall, I was permitted, with his accustomed liberality and kindness, to try several experiments on the culture of potatoes, and those experiments brought me to the conclusion, that the failure of the potatoe crops arose principally, if not altogether, from the causes below, viz.—

1st. From overripeness in what is popularly called seed, (though it must on a moment's consideration be perceived that a root cannot be a seed.)

2dly. In the method of preserving them through winter.

3dly. In taking all sizes of potatoes for sets, and cutting them into too small divisions.

4th. Exposing the sets too long to the atmosphere, especially when cut.

5thly. Covering too deep with rotten manure, or heavy soil, especially in a wet season.

1st. Over ripeness in the seed. When the tops are quite dead and withered away, and the roots are easily shaken off the straw, they are commonly said to be ripe, and in most sorts are extremely dry and mealy when boiled,—a quality very desirable for the table, but by no means necessary, but even injurious for the continuance of the plants.

I saved some that were as ripe as possible, and some that had been taken up as soon as they were fully grown, and while the tops were quite fresh and green. Between the two, next season, there certainly was a wide difference; of the roots that were quite ripe, about two out of three perished, and of what did grow, some had curled tops, and none were so healthy as they ought to have been, considering the soil, and the pains that was bestowed upon them. Under exactly the same treatment, of those that had been taken up while the tops were green, every one grew, and that with a vigour and luxuriance that astonished every one that saw them; whilst the produce was equally different,—the un-

ripe sets producing at least double the quantity at each root more than those that grew of the ripened sets.

2d. In the method of preserving them through winter. As soon as the potatoes were taken up, those that I intended for seeds, I had put into small pits, in a situation quite dry, and as little exposed to the sun as possible. The pits were about three feet wide, and made a little below the surface; a little clean straw was put in the bottom, and two, three or four, to six bushels of the sets placed in a pyramidal form, covered with some more straw, and then with soil, ten or twelve inches thick, beating it with a spade or shovel, so as to exclude the air as much as possible. This, it may be perceived, is a very different method to that commonly practised of putting large quantities in one pit, and that pit generally exposed to the heat of the sun, by which method they sprout much earlier, and those sprouts are obliged to be rubbed off to separate them, and the set is much weakened, and often its vitality destroyed.

3dly. Taking all sizes of potatoes for sets, and cutting them into too small divisions.

In the above experiments alluded to, I always found the best crops from the largest sets uncut, and the next from the middle sized sets also uncut, and the next from the large sets, cut just in two, and planted immediately. The small sets produced one or two fair sized potatoes, all the rest were small, and often of a deformed shape. Cut small sets were the worst of all. The common practice is to cut the large roots into several sets, the middle size into two, and the smaller ones planted whole. The consequence is, that if some of the largest have nearly lost their power to grow, cutting kills them, and a large number of sets will fail, and the small roots planted whole will not produce above half a crop.

4thly. Exposing the sets too long to the atmosphere, especially when cut.

It is a practice in many places to spread out the roots intended for sets to the sun, with the (in my opinion mistaken) notion of ripening them, by drying up still more the vegetable sap. I tried this plan, and almost every root failed. I have also seen large heaps of potatoes cut and thrown together for weeks, in sheds, so that when they were planted the sets were all wrinkled, and dried almost to a chip. Was it likely they should produce, in such a state, any thing like a crop?

When I intended to set potatoes, in what I considered the best method, every necessary operation was performed before the potatoes were taken out of the pit, and they were immediately planted whole, and covered up as quickly as possible. If I received any from a nursery or seedsman, I spread them on the surface of the ground, watered them well, and covered them with soil until they sprouted; if any failed, of course they were thrown away, so that I never was disappointed of a crop, excepting those which I experimented on.

5thly. Covering too deep, with rotten manure or heavy soil, especially in a wet season.

The method by which potatoes are generally planted by market gardeners and farmers is not, I think, calculated to encourage the growth of the roots that have been weakened by overheating and sprouting, and still more by being severely cut and exposed to the drying action of the atmospheric air. A trench is made with the spade or plough, and the sets are placed at the bottom, covered with manure, and then with soil. If the manure happens to be light stable litter, and the soil light and open, and a favourable season, the potatoes may get through and produce something like a crop, but if the dung be

wet and heavy, and a strong soil, with a wet season, any rational thinking person might prognosticate, with tolerable certainty, a failure. The plan which produced me the best crops was, to place the manure at the bottom of the trench, and the sets upon it, and a light covering of soil over them. In that way my success was perfectly satisfactory.

The after management was much the same as is generally practised, hoeing deep between the ridges, to loosen the soil, and earthing up in ridges as high as the plants will admit.

In considering over the above observations, the points to be attended to, to produce with certainty good crops of this important vegetable, are, to have sets taken up when fully grown, while the tops are green; to preserve them through winter in small pits; to choose the finest roots for sets to plant them whole; to expose them as little as possible to the open air; and not to cover them deep with any heavy wet material likely to prevent them coming freely through the soil.

I remain, Gentlemen, your obedient Servant,  
T. APPLEYBY.

Leeds, near Woodhouse Church, May 19th, 1835.

## THE LAND TAX.

TO THE EDITOR OF THE TIMES.

Sir,—You have on several former occasions allowed me to intrude upon your columns my suggestions for an equitable adjustment of the land-tax, I am induced once more to take advantage of your kindness and forbearance, and to solicit a revival of your attention to this most important subject. In consequence of the unceasing excitement which has prevailed among members of the House of Commons throughout the present session, I had determined to wait a more favourable opportunity previous to renewing my discussion upon a matter requiring so much calm and deliberate consideration; but Sir Robert Peel, whose authority as a practical statesman cannot be surpassed, having expressed his opinion that some alteration beneficial to the revenue might be effected with regard to the land-tax, I conceive that no time should be lost in carrying out his views, by directing public attention to them. Sir Robert in his speech on the Marquis of Chandos's motion relative to agricultural distress on the 25th ult., after adverting to the relief which might be afforded to agriculturists with regard to the auction duty observed, "Some new regulation, too, should be made about the land-tax. The law relating to its redemption was, in fact inoperative: some new plan should be devised."

Since your attention, and, through your widely circulated paper, public attention also, was first directed to the unequal pressure of this tax, most persons have become so thoroughly convinced of the anomalous and oppressive operation of the acts under which it is collected, that it is no longer necessary to adduce examples for the purpose of showing that property in thriving and populous districts is assessed to the land-tax at less than a farthing in the pound, while the same description of property in decayed and half-deserted neighbourhoods has to contribute 3s and 4s in the pound towards the same tax; and that in the one case the burden is thus ridiculously trifling, because property in the district has greatly improved in value, while in the other it is grievously oppressive, because the property has become greatly depreciated.

Assuming, therefore, that a revision of the laws

which regulate the collection of our present land-tax is admitted by all to be imperatively required, I will at once proceed with a statement of the great advantages that would accrue to the state by a general equalization of it throughout the country:—

The amount of the land-tax assessed upon England and Wales is.....£1,989,673

Of which the amount redeemed is somewhat less than £800,000, or about 3-7ths.

The annual value of property in England and Wales upon which the land-tax is chargeable is about.....60,000,000

4-7ths of which is.....34,285,712

And a land-tax upon this of 2s in the pound, equally rated, would produce...3,428,570

The amount at present collected for land-tax in England and Wales is 1,200,000*l.*, and thus a surplus revenue of at least 2,000,000*l.* would accrue from an equalization at 2s. in the pound, without in any way interfering with those who may have redeemed; but supposing Mr. Pitt's view to be acted on of including those who have redeemed, and giving them credit for the amount of their redemption, the increase would be considerably more.

Among the most plausible arguments urged by persons interested in perpetuating the present unequal collection of this tax are those which appeal to our national honour, and although the whole of them have been to my mind on several occasions most satisfactorily refuted by your able pen, I hope you will not consider me too encroaching in again slightly adverting to them.

It is stated, that because the land-tax was by 38 George III., c. 60, made perpetual for the purposes of redemption, no alteration can ever be made either with regard to its collection or distribution, and that, however anomalous its assessment may become, it would be a breach of national faith, as well to those who have redeemed, as to those who pay only a farthing in the pound, to make any essential alteration in its assessment. Now, without waiting to discuss the absurdity which such arguments would establish, of legislating upon taxes for a perpetuity, I will take the liberty of directing the attention of such objectors to the arguments used by Mr. Pitt, when he proposed the resolutions upon which the first Land-tax Redemption Act was framed. "Parliament," said that Minister, "now has the undoubted right of raising more than 4s. in the pound on the land: and what greater authority would it acquire were the present redeemed? If the whole were to be redeemed, the only thing necessary to be provided as expressly as any legislative provision can guard is, that if ever a new land-tax is imposed, it shall not be imposed upon those who have redeemed in any different proportion from that on those who have not redeemed. It would be necessary to provide that the amount of what may have been redeemed shall be deducted from any new impost."

Let us suppose that the government were to buy up the whole of the present land-tax remaining unredeemed, can any one say that after such a purchase it would be a breach of faith to impose a new land-tax, and give credit to those who have redeemed for the amount of their redemption? Assuredly not; and any equalization of the present tax upon the same principle would not only be strictly justifiable towards those who have redeemed, but an act of justice towards those decayed places where the tax is now grievously oppressive.

But even confining the equalization to the amount

of tax unredeemed, the benefit accruing to the state will, as we have seen, be very great, and I sincerely hope that many months will not elapse ere we see the revenue deriving its full advantage from a tax which, if properly regulated, is capable of being made the most equitable and the most productive of any that can be imposed.

I had intended to add a few observations for the purpose of showing that by a small addition to the spirit duties, and an alteration of a portion of the stamp duties, a surplus revenue might be obtained, which, with the amount capable of being produced by an equalization of the land-tax, would be sufficient to justify the abolition of the malt duties; but I shall have already trespassed so much on your columns that I must reserve any further suggestions to a future opportunity, of which I will avail myself should you conceive that the least good is likely to be extracted from my lucubrations.

I am, Sir, your obliged and obedient servant,  
M.

### TETANUS IN THE SHEEP.

(From the Veterinarian.)

Of all our domesticated animals, the sheep seems to suffer most from this disease. Thousands of ewes after lambing, and tens of thousands of lambs lately dropped, are lost every winter, by careless and unfeeling agriculturists. It is not a great deal of attention that these poor beasts require: a linney or shed, a few clumps of trees, or even a thick hedge, to break a little the force of the wind, would render them in a manner comfortable, and certainly would remove very much of the danger; but when they are left altogether unprotected, nothing is more common than, after a cold night, to find some of the ewes, and more of the lambs, dying or dead; every limb being drawn together, spasmed, stiffened by the cold. In travelling over some of the open parts of the country early on a winter's morning, and in the space of twenty or thirty miles, I have seen more than as many sheep and lambs dying or dead.

This happens again occasionally about weaning time, and the old shepherds pretend to tell what lambs will fall victims to it after castration. If, when the operator is sawing through the cord with his blunt knife, or gnawing it asunder with his teeth, the jaws of the little animal are strongly and spasmodically clenched, he says that that lamb is in danger of locked jaw; and, in order to prevent its occurrence, he thrusts his thumb into the mouth of the patient, and forcibly separates the jaws. There is, notwithstanding the sarcasm of Hurtle D'Arboval, much good sense in this: the spasm is interrupted, and the charm is broken, and the disposition to this excess of muscular action is got rid of before it has had time to establish itself generally. Rams are particularly subject to tetanus after castration, and especially, it is said, when the operation by torsion (*bistournage*) is improperly performed.

**SYMPTOMS.**—Tetanus generally commences in the sheep, with singular involuntary spasmodic motion of the head, and some or all of the extremities. To this succeeds a peculiar stiffness of the greater part or the whole of the frame: the neck is protruded, and the head bent back, and forcibly retained in that bended form: one leg is drawn up, and fixed in an unnatural condition. The rigidity occasionally relaxes, and gives way to violent convulsions of the head, neck, and extremi-

ties, followed again by fixidity of them and of the whole frame. The disease runs its course most speedily. The animal is often dead within twelve hours after the first attack, and, if he lingers on beyond six-and-thirty hours, it may be regarded as a pledge of his ultimate recovery.

**TREATMENT.**—The indications of cure and the means of accomplishing it are the same. A bleeding from the jugular, or from the eye vein, should be immediately effected; and, before the jaw becomes thoroughly fixed, one or more doses of the "castor oil mixture," already frequently recommended, should be given; it combines the purgative and the anodyne, which such a case requires. Some administer two drachms of aloes, or three or four drachms of Epsom salts; and, after that, and as long as the spasm continues, they give repeated doses of that well-known compound, the calves' cordial. The object sought to be accomplished is the same; the opium should at least speedily follow the purgative. I would, however, rather say, that they should be combined; and in the castor oil, syrup of buckthorn, and syrup of white poppies, there is a combination of purgatives and an anodyne well calculated to produce the desired effect.

Tetanus is a far more manageable disease in the sheep than in the horse or ox. Thousands die, because nothing is done;—but a bleeding being effected—the bowels having been opened—the lamb opened having been put into a warm bath—and then being tolerably dried and wrapped in blankets, and placed in a basket in a warm place or before the fire, and a little gruel, mingled with ginger and ale, or even the housewife's gin, being administered, a cure will often be effected.

### TO THE EDITOR OF THE "MARK LANE EXPRESS."

SIR,—It is but a short time ago since I was first favored by a friend with the perusal of your weekly publication, which I now read with much interest as regularly as it arrives, and in which I find almost whole columns filled with lamentations on the distress of the farmers in England, together with advices, plans, and projects for the ostensible purpose of alleviating such distress, but which plans, &c. we natives and inhabitants of the continent, judging impartially, and without being biassed by any prejudice or particular views, plainly see to be chimerical, and that the agricultural distress in England arises from causes which cannot for a long time to come be removed, and that the whole machinery of Government, and the system of agriculture must undergo an alteration, before any cure of the disease can be expected.

In order to explain this, I beg leave, to state my thoughts on this subject.

England by a series of wars, subsidies to continental Powers, &c. has burthened itself with a national debt of such monstrosity, that it is shuddering to think on the millions required to pay only the interest of it; this and all the other heavy expenditures of the Government, such as the unheard-of salaries to its servants, pensions, sinecures, with a long train of et ceteras naturally require heavy duties and taxes, which are levied on the community, while at the same time a great part of this revenue goes into the pockets of comparatively a few only, without affording any material benefit to the mass of the people. The whole of this system, with a variety of other causes attending it, taken together, has enhanced the value of almost all

the necessities of life to double and treble of what they are in other countries, and following the whole chain of causes and effects, we find the imperious necessity of heavy taxation, imaginary value of landed and other property, consequent high rents, and inability of the farmer to pay both rents and taxes, when corn, from natural causes, is so low that its price will not pay the rents, taxes, and the expense of producing it. Taking all this for granted, (and I doubt whether it can be contradicted) it would appear, that were it possible to reduce the expenditure and the revenue of the Government to half of what it now is, the value of every article, landed property included, would also be reduced in proportion. Rents would of course, be lower; the expenses of farming diminished, and the corn prices coming on, or near a level with those on the Continent, the English farmer would be in a condition to compete with his continental brethren, and the importation of foreign corn, would prove no injury to him. By the decrease of value of landed property, and consequent diminution of rent, the landowner would lose very little, as in proportion as his income would be less than it is at present, he would be enabled to live in the same style as he does now, and to purchase the same enjoyments, at a price equally proportionate.

Allow me now, Sir, to state some other points, in order to show how a farmer on the continent, (and I will take Holstein, where heavy taxes are paid, as an example) is enabled to produce his corn at a cheaper rate than an English one.

Let us in the first place consider that it is an undeviating rule laid down in our system here, that a farm must support itself, and work on its own resources; i.e. that the farmer must not on any account, part with his cash, except for such things as cannot possibly be produced on his farm. Even a part of his apparel must be made on it, and by sowing hemp and flax to be spun by his maids, during the long winter evenings, he provides for deficiencies arising in his household linen.

Secondly, let us consider the cheapness of his implements, in comparison to those in England. He can get a very good plough made complete for about 30s. sterling; a harrow with twenty-four iron tines, for about 14s. to 16s.; a strong waggon twelve to thirteen feet long, for 9l. to 10l.; a winnowing machine for 4l. to 5l., and other instruments in proportion, and when the landowner allows his farmer to cut as much wood annually, as is required for the completion of his agricultural implements, which very often forms an article in the contract, he procures an artificer to make them on his farm, at a much cheaper rate than what they would otherwise cost him. On large farms where twenty, twenty-four or more horses are kept, the head man is regularly something of a mechanic, who makes and repairs the wood part of ploughs, &c., and on those who have no smithy of their own, a contract is made with the nearest blacksmith to keep the ironwork of each plough in repair for 7s. sterling, and each horse shod for 8s. per annum. Now compare these prices with those an English farmer has to pay for his instruments, &c., and you will see what an immense advantage the former has over the latter in this article only.

Thirdly, and of the greatest consideration is the production of the manure, which ought *never* to be bought, except in the single instance when to be had cheap. Within the distance of no more than about six or seven miles from a large town, and even then the purchasing of it would be avoided if possible, for, al-

though a waggon load of town dung may be had, for instance in Hamburg at 1s. 5d., the labour, and time spent in fetching it, and the expense of laying it in meats intermixed with heath or grass sods (as without this it would not spread enough) previous to its being brought on the land, occasions an outlay which ought to be saved, and interrupts the regular course of labor on the land. The Holstein system of keeping as many cows as can properly be fed, combines the means of producing a sufficient quantity of manure, and of making at the same time large quantities of butter for exportation. There are many large estates, either farmed out, or not, on which 200 to 300 cows are kept, which are fed in the stalls from November to the middle of May, and remain out in the pastures day and night from that to the end of October, so that in fact the farmer has only the manure made during the winter, yet this is sufficient, and sometimes more than sufficient for his wants, and his lands are constantly in the best possible order.

As to rents in general, it ought to be borne in mind, that the more they be made moderate for the farmer to bear, the more will the land-owner be benefitted by it; not in point of actual pecuniary profit, but by the certainty of his rent being paid him in full in due time, and also by being convinced that the farmer thrives, and thereby is enabled to keep his lands in good order, which is always a profit in the sequel.

As to the means of assisting the farmer in the first instance, and to bear him out of his present distresses, it matters not whether the medium of exchange for produce be gold, silver, or paper, or whether the duties on foreign corn be raised, lowered, or superseded altogether; such projects appear to us here, nothing but chimeras, and will tend to nothing, except to create some new artificial state of things, which, in the end, will also prove fallacious. First of all, the rents must be reduced in proportion to a certain standard value of corn, and the land-owners, instead of an income of, say 10,000l., must rest contented with 6,000l. or 7,000l. a-year. I dare say this will not meet their gusto, and there will hardly be found one who will go further than to make a *most generous* sacrifice of ten to fifteen per cent of the rents, but they may rest assured that their pertinacity will gain them nothing in the end, and the increasing distress of the country people, producing more and more pauperism, will at last bring that about, which might have been avoided.

What I have before said about the enormous national Debt of England, as being the primary cause of the distress of the cultivator of land, I find corroborated in the history of your country, where it may be seen, that not longer ago than 1766, when a failure of the crop took place, and some riots in consequence of the dearth of provisions, an embargo was laid on the exportation of corn (at that period England exported) and in a note by the author (Belsham) he asks,

"Whence is it that the poor's rates are so alarmingly increased, that the workhouses of the Kingdom are crowded?" &c.

And solves his questions by saying,

"Two causes obviously present themselves as jointly and powerfully co-operating to their production: 1st. the enormous increase of the national debt, which is in fact only taxation of the poor household, for the benefit of the rich stockholder, and 2ndly, the vast and prodigious fortunes amassed by individuals." &c. &c.

But there is another cause operating to augment the distress of the cultivators of the soil, and this must

be found in the contest of the English with foreign countries, to be the first in trade, manufactures, and agriculture; but they do not consider that where one of these branches prospers beyond the limits assigned to it by the nature of things, the other will suffer in proportion. Trade and manufactures go hand in hand together, and assist each other generally, but they will at all times be in opposition to agriculture, and I believe that to combine the one with the other, so that each should excel in an eminent degree, is a problem not as yet solved anywhere.

In concluding this letter, I have to beg you will excuse the grammatical errors I may have committed, having very little practice at present in your language,

I remain, Sir, your's very obediently,  
Scheneffeld. H. DE JOUGH.

In the Duchy of Holstein.

June, 1835.

### A BILL TO REGULATE THE IMPORTATION OF FOREIGN CORN INTO THE ISLE OF MAN.

Whereas an Act was passed in the ninth year of the reign of his late Majesty King George the Fourth, intituled, "An Act to amend the laws relating to the Importation of Corn," whereby certain Duties, as set forth in a Table annexed to the said Act, are made payable in the United Kingdom upon the importation of Corn, Grain, Meal, or Flour, but which duties are not payable in the Isle of Man: And whereas the surplus productions of the Isle of Man are nevertheless admissible, under the laws now in force, into the United Kingdom without payment of any Duties: And whereas the inhabitants of the Isle of Man do not stand in need of any supplies of Foreign Corn for their consumption, and therefore it is necessary for the better enforcement of the said Act, with regard to the importation of Corn into the United Kingdom, to make new provisions for regulating the importation of Corn into the Isle of Man: Be it therefore enacted, by the King's Most Excellent Majesty, by and with the advice and consent of the Lords Spiritual and Temporal, and Commons, in this present Parliament assembled, and by the authority of the same. That from and after the passing of this Act, it shall not be lawful to import into the Isle of Man any foreign Corn, Grain, Meal, or Flour, except upon payment of the same duties as are by the said Act made payable on the importation into the United Kingdom of Corn, Grain, Meal, or Flour.

And whereas by the said Act it is provided, that a certain Certificate of the aggregate average prices of Corn shall be transmitted to the Collector or other Chief Officer of the Customs, at each of the several Ports of the United Kingdom: Be it further enacted, That the said Certificate shall in like manner be transmitted to the Collector or other Chief Officer of the Customs at the Port of Douglas, in the Isle of Man; and that the Duties payable as aforesaid in the Isle of Man shall be ascertained from time to time by the prices set forth in such Certificate, in like manner as the same are ascertained in the United Kingdom.

And be it further enacted, That the Duties imposed by this Act shall be raised, levied, collected and paid unto his Majesty in like manner as if the same had been imposed by an Act passed in the third and fourth years of his Majesty's reign, intituled, "An Act for regulating the Trade of the Isle of Man."

SOCIAL STATE OF LOWER CANADA.—The constituency is very widely diffused—among the half million of people there are at least 80,000 electors, of whom nine-tenths are proprietors of the soil: several counties have from 4 to 5,000 electors, all of whom are landed proprietors. The total num-

ber of proprietors of real property in 1831 was 57,891; and of persons holding property not otherwise than real, 25,208. Of families employed in agriculture, 50,824; and of families engaged in commerce, only 2,503. The number of farm servants employed was 7,602, which shows what a large proportion of the agriculturists are small farmers. The number of persons subsisting on alms, in a total population of upwards of half a million, was only 1,282; and which, I suppose, included a large proportion of 408 deaf and dumb, 334 blind, and 924 insane persons.—*Martin's British Colonies.*

### ON BRONCHITIS IN CATTLE.

BY MR. MEYER, SEN., V.S., NEWCASTLE-UNDER-LINE.

(From the Veterinarian.)

Messieurs Editeurs,—As many of your contributors will, no doubt, feel interested in having the ultimate results attendant upon the treatment of those cases of bronchitis noticed in a former number of your journal (vol. vii. p. 585), I have much pleasure in forwarding the particulars without further preface, except that I would apologize to Mr. Youatt for not having noticed, in my last paper, his article upon bronchitis in that valuable publication, *The Farmers' Series*; it did not meet my eye till some time afterwards: had I seen it, it would have superseded much that mine contained. Having thus made the *amende honorable*, I shall proceed:—

The little patient, upon which the operation of tracheotomy had been performed, recovered much of its condition, spirits, and appetite; but as the wound in the trachea gradually healed up, it pined away again, and ultimately sunk, although the Indian pink, conjoined with saline medicines and fumigations, were followed up to the last. On a post-mortem examination, I found not more than half the quantity of worms as in the first case, many of them having, no doubt, been expelled or crept out through the opening into the trachea. The anterior and middle portions of the lungs were of a bright vermilion hue, shading gradually off to their natural colour towards their posterior portion. The lining membrane of the bronchi and air-cells was much inflamed, but not so that of the trachea.

I consider the operation of tracheotomy, in extreme cases, as a most valuable aid; but it should be done low down, as it affords, in the first place, greater facility for the expulsion of worms; secondly, by admitting currents of cold air immediately upon their nidus, it renders their habitation less tenable. Thirdly, it allows you, as the wound closes up, the opportunity of operating again above. The operation is of the highest importance too in taking off the spasmodic effect produced upon the laryngeal muscles from the sympathetic irritation and effects of the worms, occasioning asphyxia to a great degree, but which is immediately removed by the operation; the animal breathing afterwards comparatively easy.

There were now five other calves left, nearly of the same age, and which had been running out along with the others ever since they were weaned: these were labouring under the same affection. Finding the medical treatment adopted in the last case did not succeed, I determined upon giving the turpentine a fair trial; for which purpose I combined some ol. terebinthine with oleum commune; but the farmer felt so prejudiced against using any strong medicines, that he would not give it, for

he had not only administered, before he applied to me, tar balls, but the strong remedies recommended by Clater, under the effects of which the calves were fast sinking. I therefore advised him to try a remedy my father used to employ with success, consisting of half-a-pint of lime-water every morning to each calf, and a table-spoonful of common salt; dissolved in half a-pint of water, every afternoon, keeping them out at grass, and varying their pasture from time to time. This plan of treatment was regularly pursued for some time and succeeded; the remaining calves were soon in perfect health, and suffered very little in their growth; in fact, a stranger not knowing the circumstance would not suppose they had laboured under any disease. Where lime-water cannot be procured conveniently, I would recommend half-a-drachm of aqua kali pur. in half-a-pint of linseed tea as a substitute. Common salt is a valuable medicine, either as a preventive to the development of worms, or as a specific against some of the species, as the fluke-worm, &c. : it is particularly obnoxious to them either in or out of the body.

There is little doubt that it must be transmitted along the absorbents, and pass through the discerning vessels with the proximate elements of which it is composed, in as intimate a union as when taken into the stomach; for it is a well-known fact, that bodies taken into that viscus will become absorbed into the circulation, and pass apparently unaltered through the discerning vessels of some of the glands of the body. If the secretions formed by the mucous membrane of the bronchi become impregnated with the muriate of soda, it would render the worms sickly, and occasion them to quit their hold, in consequence of which they would be easily expelled through the larynx and mouth. Some individuals are in the habit of giving a table-spoonful of powdered savin in half-a-pint of milk, daily, with tolerable success. Others dress the inside of the nostrils with oil of savin, and administer a small portion of the same daily, diluted with vinegar. An old cowleech told me he was always successful with the oil of savin. Some extol *asafoetida* rubbed down with vinegar. In consequence of the inflammation of the bronchial tubes and lungs, the administration of turpentine, or other strong anthelmintics, is of dubious policy; for, whilst you are striving to steer clear of Scylla you may fall into Charybdis: but it is the duty of the veterinary surgeon to watch narrowly the progress of the symptoms, and take his tack accordingly. It appears, upon inquiry into the history of this singular and fatal affection, that where calves are of strong and vigorous constitutions, so as to wrestle with the affection till cold weather sets in, they will spontaneously recover.

It occurs in all situations, and upon every description of soil; but it is most frequently met with upon low marshy districts, particularly where the water percolates through a peat stratum of soil. Farms situated upon marly strata are the least subject to it.

It prevails to a great extent during very dry years, when the pit water upon different farms becomes nearly dried up, and rendered putrid and full of animalculæ; as was the case upon that particular farm where the above cases occurred: on this account I should strongly recommend the flinging into the pits, from time to time, some quick lime. As cattle are much addicted to go into the water during warm weather, and, remaining there for some time, voiding their dung and urine, our worthy Professor at the Veterinary Col-

lege suggested the idea of the ova being furnished by this means, which, *a priori*, would appear very probable, as the worms belong to the species of intestinal worms, which are found deposited in all situations of the animal body. A friend of mine, however, furnished me with a fact which militates against this idea. He has two farms, one situated high and upon a calcareous marly stratum, where the disease is seldom or never known; the other lies low, and has a large piece of ground, into which he turns his young colts and sheep, but which possesses a peat bottom. On one occasion, although warned by a neighbour as to the consequences, he turned his young rearing calves into it, every one of which took the hoose, but by immediately sending them to their old quarters they soon recovered. He stated, moreover, that his upper farm had only pit water upon it, which, although in dry weather, the ponds were nearly dried up, and rendered foul by the cattle standing in them dunging and staling, yet the beasts remained free from the hoose.

From the little that is known of the history of these parasitical animals, it is impossible to say whether they are taken up in their state of ova from the fluids received into the intestines, or whether the ova are deposited within the nostrils, and there hatched to that point when their instinctive propensities develop themselves so as to guide them to that situation where they are found and brought to maturity. I myself consider that the vegetable matter and soil through which the water filters furnishes the ova, which, being taken into the stomach and intestines, and being smaller than the globules of which either the chyle or blood is composed, pass easily through the absorbents, and even the discerning vessels of the glands and of mucous or even serous surfaces. This appears to be the only way in which we can rationally account for their being found in the various parts of the body in which they are met. I can readily conceive it possible for the ova to be transmitted through every series of ramifying vessels in the body, and yet not become developed until accidental circumstances turn up, such as a diseased gland, so as to favour the unfolding of that vital and vivifying principle inherent in seed of every kind.

In my last paper these worms are stated to belong to the strongylus species; but upon examining them more minutely, I consider them belonging to the variety called *ununaria*, the characters of which are, body filiform, elastic, head with membranous angular lips; the tail of the female needle-shaped, and that of the male, armed with two hooks encased in a pellucid vesicle.

The characters of the strongylus species are, body round, long, the fore part globular and truncate, with a circular aperture, fringed at the margin; the hind part of the male hooded, that of the female pointed.

P.S. I forgot to state, that my son has met with these species of worms in the bronchial tubes and air-cells of an ass, whilst dissecting at college; and what was very singular, there were no urgent symptoms before the animal was killed, to lead to any suspicion of their existence.

---

INCREASE OF COMMERCE.—In 1832 the official value of the importations into Great Britain was 43,237,000*l.*; and in 1834, 46,908,000*l.* showing an increase in the two years of 4,671,000*l.* The real value of British produce and manufactures in 1832 was 36,046,000*l.*, and in 1834, 41,286,000*l.* showing

an increase of 5,240,000*l*. This increase is the more remarkable when the fall that has taken place in farming produce is considered. The official value of cotton imported in 1832 was 9,470,000*l*, and in 1834, 10,890,000*l*; increase 1,420,000*l*. The real value of cotton manufactures exported in 1832 was 17,350,000*l*, and in 1834, 29,500,000*l*; increase 3,150,000*l*. The official value being calculated at prices fixed in the reign of William III. is of no other use than to denote quantity.

### AGRICULTURAL LABOUR.

MR. EDITOR,—When it is known that the sum raised yearly in England for the support of the poor (near eight millions) is equal to the whole revenue of the vast kingdom of Spain, and that there still exists a frightful mass of poverty and immorality *evidently increasing*, it is time for the landowners to bestir themselves, and endeavour to apply some remedy to the evil. Having in a former letter endeavoured to show how little the occupiers of land can be benefited by Parliament, I now turn to the connection between the owner and occupier. It is a great advantage to a tenant that his landlord should himself be acquainted with the nature and value of landed property, and that he should employ as steward or agent a man of steady, regular habits and principles, well versed in rural affairs. In either of these cases the tenant will not be called upon to pay a rent which it is impossible for him to make by his skill and industry, if he is so fortunate as to have an honest and conscientious landlord.

Besides the rent, taxes, and poor rate, two very considerable sources of expense, indispensable, present themselves in the shape of labour: the labour of men and the labour of horses.

In this letter I shall confine my observations to human labour. Every individual born in a parish has a right to a maintenance in that parish; but it is of the highest importance that such persons should, as much as possible, live by their own labour, and also that that labour should be mutually advantageous to the labourer and the farmer: there are, however, times when the labourer must necessarily be in a state of idleness, unless he has some occupations of his own, on which he can not only employ every leisure hour, but also those of his wife and family; and it is by such arrangement alone that a proper feeling can exist betwixt the gentry, the farmers, and the labourers. In short, to allow the labourer to occupy a portion of land on his own account, with a condition that he be a member of a benefit society or sick club, and that neither he nor his family ever apply for parish relief.

Every labourer of good character and industrious habits should be allowed to rent from one to two acres of land on the same terms as the farmers, to enable him to keep a cow. So early as the year 1805, when agent myself to a liberal-minded gentleman (now no more), who had a large landed property in the county of Nottingham, upon an enclosure taking place I let forty acres of land to twenty labourers on the above conditions, from which the most beneficial and satisfactory results followed, in lowering the poor rate one half in a short time, and giving every degree of comfort to the families, the fruit of their own industry; and no rents could be better paid.

Farmers in general object to the labourers occupying land, upon the principle of its making them independent of their employer. This is a gross mistake. I know that such men as have a

little occupation, are the most careful and industrious, from habit anxious to employ every hour. Their wives and children also being early accustomed to the care of animals, poultry, &c., make the best and most careful servants. Besides the cow, which produces many comforts of itself, enables him, with the corn gleaned at harvest to kill a large pig, to keep poultry, a garden, bees, which are very profitable, &c.

I should say in round numbers, that a labourer with an industrious wife and four or five children, ought to make 30*l* or 40*l* a year by their joint labour. At present it does not appear that they can make half as much, yet they must and will find means to live. I ask the landowners if it is not better to give them land to occupy than suffer them, for the maintenance of a poor, half-starved, ragged family, to resort to poaching or thieving. A man occupying two acres of land will make from 10*l*. to 15*l*. in butter, cheese, milk, whey, for the family and the pig, in a year. Turn now to the poor landless, gardenless inhabitant of a row of cottages, built in some obscure situation, without anything to interest him or employ a leisure hour; the children of six or eight families running together in common, early initiated in vice and idleness, without respect for persons or property, cunning as foxes, from constantly hearing the tales of their unfortunate parents, who, having no occupation, resort to the beer-shops, where they meet others in the same state of destitution—the result is the poachings, robberies, and horrible burnings of farmers' property before named—and every Assize and Sessions gives you full proof of what I assert.

I read with much pleasure in your valuable Journal accounts of societies for letting small portions of land to the working classes, to be managed by the spade husbandry. To a certain extent such societies are useful, but they generally fall into disuse, the successors of those who project them having no taste for that sort of thing. I have lived long enough to have seen this happen. I am old enough to remember, in many instances, the comfort in which the cottagers lived before the commons were enclosed, when they had a cow, a pig, a few sheep, a flock of geese, a garden, bees, poultry, &c., grew their bit of flax, and spun every article they wore, both linen and woollen; and had the Commissioners laid out a portion of land to every cottage, it is more than probable that the present horrible state of misery and demoralization would never have been seen in once happy England.

I shall conclude by repeating it would be well both for themselves and society at large, that landowners should as much as possible render the situation of the working classes more respectable, by affording them the means of exercising their industry, and that of their wives and children, the whole of whose leisure time it employs profitably besides the moral effect at once so visible. The comforts where a cow is kept in any family are endless, particularly where there are children. The puddings, mashed potatoes, milk porridge, and numberless other advantages in butter, cheese, eggs, &c., which weekly produce their little groceries, clothing, schooling, &c., and lastly, but not the least, is the little and respectable pride engendered in the bosoms of the family in the possession of this self-created and clear profit, the fruits of their joint industry, without the aid of expensive horse labour, about which I have something to say in my next.—I remain, Sir, your obedient humble servant,

Lisbon, May 23.

F. C.

## WOOL AND WOOLLEN MANUFACTURES.

THE PHILOSOPHY OF MANUFACTURES—AN EXPOSITION OF THE FACTORY SYSTEM OF GREAT BRITAIN. By A. Ure, M.D. F.R.S. London: Knight.

The woollen manufacture, long regarded as the staple trade of England, first rose into importance in the reign of Edward III., who encouraged the Flemings to establish factories in various parts of the country. Previous to this, raw wool was the most important article of British export; for, in 1349, we find the parliament remonstrating that the king, by an illegal imposition of forty shillings on each sack of wool exported, had levied 60,000*l.* a-year, which would make the annual export of wool eleven millions of pounds *avoirdupois*. The medium price of wool at the time was about 5*l.* per sack; the whole annual value of export 150,000*l.* The native merchants looked upon the foreign traders with very jealous eyes, especially when Edward created a monopoly in their favour, by prohibiting the wearing of any cloth but of English fabric; and many petitions are preserved from the weavers of woollen stuffs, complaining of the heavy impositions laid upon them by the corporations, in which the corporation of Bristol is especially conspicuous. The manufacture, however, took root and flourished, though it received a severe check from the jealousy of parliament, which, by a very unwise law, prohibited the export of woollen goods, and permitted that of unwrought wool.

In the reign of Henry VI., not more than a century after its introduction, the woollen manufacture had thriven so well, that it was made to contribute to the revenue, and we were enabled to compete with the nations by whom we had been taught it, on equal terms: a reciprocity law, passed at this time, ordains, that "if our woollen goods were not received in Brabant, Holland, and Zealand, then the merchandize growing, or wrought, within the dominions of the Duke of Burgundy, shall be prohibited in England under pain of forfeiture." But there was already a growing jealousy between the landed and manufacturing interests, caused by the rise in the price of labour, resulting from increase of employment; for so early as the reign of Henry IV. an act was passed "that no one should bind his son or daughter to an apprenticeship, unless he was possessed of twenty shillings." This attempt to limit the supply of labour in manufacture would have wholly destroyed the woollen trade, had not the first monarch of the house of Tudor granted an exemption from the act to the city of Norwich, and subsequently to the whole county of Norfolk.

Henry VII. removed a still greater check to industry, by restraining the usurpations of corporations. A law was enacted, that corporations should not pass bye-laws without the consent of three of the chief officers of state: they were also prohibited from exacting tolls at their gates. The necessity of legislative interference was proved by the conduct of the corporations of Gloucester and Worcester, which had actually imposed transit tolls on the Severn—these, of course, were abolished. But the monarch was not superior to the prejudices of his age; he affixed prices to woollen cloths, caps, and hats, which, of course, led to a deterioration of the several articles. Yet this law was highly extolled as a master stroke of policy by the statesmen of the day.

The parliaments in the reign of Henry VIII. were

too busily engaged in enforcing the king's caprices, by inconsistent laws against heresy and treason, to pay much attention to trade and commerce. One circumstance, however, connected with the woollen trade, deserves to be noticed. So greatly had our woollen manufactures increased, that the Flemings, no longer able to compete with the English as producers, entered into the carrying trade, bought the English commodities, and distributed them into other parts of Europe. In 1528 hostilities commenced between England and the Low Countries; there was an immediate stagnation of trade; the merchants having no longer their usual Flemish customers, could not buy goods from the clothiers; the clothiers in consequence dismissed their workmen, and the starving operatives tumultuously demanded "bread or blood." Shakspeare, whose father was a woolstapler, and who therefore perhaps had heard, traditionally as well as historically, of the sufferings of the clothiers, makes it a ground of charge against Wolsey, though he assigns another cause—

The clothiers all, not able to maintain,  
The many to them 'longing, have put off,  
The spinners, carders, fullers, weavers, who,  
Unfit for other life, compelled by hunger,  
And lack of other means, in desperate manner  
Daring the worst to the teeth, are all in uproar,  
And danger serves among them.

*Henry VIII. Act I. Scene 2.*

Wolsey scarcely knew how to account for these riots; he tried force with the workmen, but hunger was stronger than the law; he threatened the clothiers unless they gave employment, but wages could not be paid from empty purses; at length he sent for the merchants, and commanded them to buy cloth as usual! The merchants replied that they could not sell it as usual; and notwithstanding his menaces, would give no other answer. At length the true remedy was discovered; an agreement was made that commerce should continue between the two states even during war.

In the reign of Edward VI. an act was passed, by which every one was prohibited from making cloth, unless he had served an apprenticeship of seven years; this law was repealed in the first year of Queen Mary, as the preamble of the act states, "because it had occasioned the decay of the woollen manufactory, and ruined several towns;" it was, however, subsequently restored by Elizabeth.

The persecution of the Protestants in France, but more especially in Flanders, drove many eminent manufacturers to seek refuge in England, where they were graciously received by Elizabeth. She passed an act relieving the counties of Somerset, Gloucester, and Wiltshire, from the old oppressive statutes, which confined the making of cloth to corporate towns; and trade, thus permitted to choose its own localities, began to flourish rapidly. In a remonstrance of the Hanse Towns to the diet of the empire, in 1582, it is asserted, that England exported annually about 200,000 pieces of cloth. In this reign also the English merchants, instead of selling their goods to the Hanseatic and Flemish traders, began to export themselves; and their success so exasperated the Hanse Towns, that a general assembly was held at Lubec to concert measures for distressing the English trade. But the jealousy of foreigners was far less injurious to British commerce than the monopolies, which Elizabeth created in countless abundance. An attempt, indeed, was made to remove one monopoly, but the experiment was not fairly tried, and its consequent ill success was used as an argument against any similar

efforts. By an old patent, the Company of Merchant Adventurers possessed the sole right of trading in woollen goods. This monstrous usurpation of the staple commodity of the kingdom was too bad even for that age of darkness, and Elizabeth opened the trade; but the Merchant Adventurers entered into a conspiracy not to make purchases of cloth, and the queen, alarmed by the temporary suspension of trade, restored the patent.

In the reign of James I. it was calculated that nine-tenths of the commerce of the kingdom consisted in woollen goods. Most of the cloth was exported raw, and was dyed and dressed by the Dutch, who gained, it was pretended, 700,000*l.* annually by this manufacture. The king, at the instigation of Cockayne and some other London merchants, issued a proclamation prohibiting the exportation of raw cloths; the Dutch and Germans met this piece of legislation by prohibiting the importation of English dyed cloths; the consequence was, that our export trade was diminished by two-thirds, and the price of wool fell from seventy to eighty per cent. The king was forced to recall his proclamation. In the year 1622 a board of trade was erected, as the commission states, "to remedy the low price of wool and the decay of the woollen manufactory." It is recommended to the commissioners to examine "whether a greater freedom of trade, and an exemption from the restraint of exclusive companies, would not be beneficial." A gratifying proof of the progress of intelligence, but unfortunately it led to no practical result.

English commerce increased greatly under the Commonwealth, because no regard was paid to the prerogative whence the charters of the exclusive companies were derived, and because the progress of democratical principles led the country gentlemen to bind their sons apprentices to merchants. But with the Restoration came the old rage for prohibitions and protections; two thousand manufacturers from Warwickshire, and a great number from Herefordshire, emigrated to the Palatinate; and, in 1662, the Company of Merchant Adventurers declared, in a public memorial, that the white-clothing trade had abated from 100,000 pieces to 11,000! In 1668, however, some Walloons were encouraged to introduce the manufacture of fine cloths, from Spanish wool only, without the admixture of any inferior wool; but the progress of this branch of trade was very slow, owing chiefly to our municipal laws, which pressed heavily on foreigners.

It could not be asserted that the slow progress of the woollen manufactory was owing to any want of legislative protection, the exportation of wool, facetiously called *owling* in our old laws, because it was principally carried on during the night, was prohibited by many severe statutes. One, passed in the reign of Elizabeth, makes the transportation of live sheep, "or embarking them on board any ship" "for the first offence, forfeiture of goods, and imprisonment for one year, and that at the end of the year the left hand shall be cut off in some public market, and shall there be nailed up in the openest place; and the second offence is felony." And this statute is the more remarkable when contrasted with one then in force, by which it was enacted that "no person shall keep or have more than two thousand sheep, on pain to forfeit for every sheep above the number, 3*s.* 4*d.*"

But severe as was Elizabeth's statute, it was exceeded by that of Charles II., which declared the exportation of wool a felony not to be set aside by royal licence! The extravagant severity of such a law defeated its purpose, and the penalty was subsequently

changed into fine and imprisonment, but "fuller's earth was at the same time included in the list of prohibited articles."

But the legislature was not satisfied with securing a monopoly of materials to the woollen manufacturers, it deigned to give them instructions in their trade. Acts were passed for regulating the length and breadth of cloths; for enforcing the introduction of improved processes of manufacture; for securing efficient dyeing and colouring; and even for determining the mode in which they should be stretched and dried. Somehow or other manufacturers were not one whit improved by the paternal care of the government; and parliament, in its wisdom, next proceeded to find customers for the manufacturers over whose production it had watched so tenderly. Foreign cloths were prohibited; it was ordained that every man should wear English cloth, and, lest the living should not afford a sufficiency of custom, the dead were forced to contribute, a penalty being affixed to the interment of a corpse in any but a woollen shroud!

All these privileges and protections, bad enough in themselves, were tenfold worse in their consequences. The wool-grower robbed of his foreign market, demanded and obtained protection in the market at home. The manufacturers, secured from competition, made no attempt to improve the processes of workmanship; English cloth had long lost its fame in Europe, and "the staple manufactory" would have probably died a natural death had not a market been secured in our increasing American and West India colonies. But then came the American war, the monopoly of market was lost, and wool became a drug in the market: the best quality was to be bought for less than four pence per pound. Two pieces of good fortune saved our "staple manufactory" from ruin; parliament did not interfere, and the example of the cotton manufacturers induced the wool traders to direct their attention to machinery. Since that period the manufacture has been gradually emancipated from legislative trammels, and, instead of being wholly ruined, as seemed all but certain in 1782, our exports of woollen cloth average now between 6 and 7,000,000*l.* in value. This, to be sure, is but a small increase compared to that of the cotton trade, which has advanced with a rapidity to which the annals of the world afford no parallel.

The statistics of the woollen trade at present, as far as they can be ascertained, give us the following results: Number of Manufactories, 1,315—Male operatives, 31,360—Female operatives, 22,526.

The rate of wages varies so much in different counties that it would be impossible to form anything like an accurate average; wages also depend very much on the parts of the manufacture in which the operatives are engaged. We shall now proceed to examine the processes, before enquiring into the effects of the manufacture on the health and morals of the operatives, taking for our guide Mr. Drinkwater's very valuable reports to the Factory Commissioners.

The processes of spinning worsted and lamb's wool—worsted yarn being spun from what is called long wool, which is produced exclusively in England; lamb's wool yarn is spun from short wool, and also from the refuse of the long wool after it has passed through the hands of the combers. Long wool is first washed and dried; the washing is performed by men, boys attend them to convey the wool to the drying room, where it is spread out upon the floor. This room is kept at a very high temperature, but the boys remain in it a very inconsiderable time. The wool is then removed to the *plucker*, an instrument by which

its fibres are straitened to prepare it for the card. For some descriptions of work it is combed instead of carded; combing is performed by manual labour, in close hot rooms, for stoves are necessary to keep the combs hot; it is a very laborious employment. Cards, however, are gaining ground upon the combs. The cards are worked by machinery; and are tended by children, who are either *feeders*, to supply the washed wool, or *doffers*, who receive the wool from the drawing head in the shape of a loose untwisted rope or sliver. This part of the work is that in which employment is generally found for the youngest children in the worsted factories. The wool is then removed to the *bobbin frame*, where it receives its first twist, and from this point the principle of the machinery remains the same, to the finest thread that can be drawn. The untwisted rope of wool, technically called *open drawing*, is introduced by its end between two pair of rollers, the second pair revolving faster than the first; the consequence of which is, that the thread is necessarily drawn out, and a greater or less degree of twist according to the stage of the manufacture. The business of the attendant on the bobbin-frame is to join the beginning of one open drawing to the end of the preceding, and to remove the spindles when full. After this process has been repeated four times, the drawings are called *rovings*, and from the roving frame the thread is removed to the *spinning frames*, which, though distinguished by a separate name, do not differ essentially from the drawing and roving frames. The spinning frames however require more care; they are attended by girls of between sixteen and twenty, who earn (in Leicester) from nine to ten shillings per week. The others are paid from six to seven shillings per week, according to their proficiency.

The process we have described belongs to long wool, where it is of importance to straighten the fibres; in short wool, on the contrary, it is necessary to break the fibres, and for this purpose the wool is exposed to the action of spikes revolving in a box with great rapidity. This machine, called the *Shakewilly*, appears very formidable to a stranger, and the workmen vulgarly term it the *Devil*. Wool is introduced into the *Shakewilly* whilst the machine is in motion, and several serious accidents have occurred from want of caution.

The wool is then placed on the *scribbler*, a machine by which it is oiled and carded; thence it passes to the *carding machine*, which is so contrived that the wool is finally doffed in disconnected layers. These layers pass under a fluted roller, which rolls each up into a cylindrical form, in which state they are called *cardings*.

The cardings, as they fall from the machine, are collected by children called *pieceners*, whose business it is to piece or join the cardings together for the purpose of being drawn into a continuous thread. The frame at which this is done is called a *slubbing billy*, and the man who performs it a *slubber*. There is nothing similar to the process of slubbing in the worsted and cotton manufactories; and it is necessary to bear this in mind, for it will presently appear that in this process children are more liable to be overworked and cruelly treated than in any other species of factory employment.

The billy is not worked by machinery; the speed and continuance of its labour is entirely at the option of the slubber. There are generally sixty spindles, one slubber, and four pieceners belonging to each billy. The little pieceners take the cardings and place them on a low, sloping board, called the billy-

board, joining the ends together by rolling them with the palms of their hands, each child bringing fifteen cardings at a time. The billy has an oscillating motion through a space called the *billygate*; it is set going by a fly-wheel, which the slubber turns with his right hand while he governs the frame with his left. If the work goes on regularly, the children have ample time to piece their fifteen ends; but if this be done incompletely, defects called *flies* are produced on the slubbing, and if any end be left unjoined, the ends are said to be *let up*, which of course, causes delay. The slubber is provided with a strap to punish the pieceners in case of neglect, but he not unfrequently uses the billy-roller, which is easily detached, and inflicts a very severe blow. If the slubber be disposed to leave his work, as many do for an hour together, the cardings accumulate with great rapidity, and are piled by the children in stacks. When the slubber returns he sets to work more violently than common, in order to overtake the card; the children have to continue piling the cardings, constantly thrown off by the machine, and at the same time, to piece their ends with double rapidity. On these occasions the labour of the children becomes very severe, and their unavoidable faults incur cruel punishment.\*

From the slubber the yarn goes to the *spinner*, who works at a frame called a *jenny*, by which the yarn is spun finer. The spinners are usually men.

The dressing and finishing of cloth is a business totally distinct from the manufacture of woollen yarn: the power loom is scarcely known in the cloth trade, and when used it is for the coarse description of goods. There is no uniformity in the employment of hand-weavers: in some factories they weave, dress, and finish cloth from all the yarn they spin; others sell their yarn, or give it out to the weavers; others manufacture nothing themselves, but purchase the cloth ready woven to dress and finish.

No female children are employed in finishing cloth, and very few little boys. The boys are principally employed in *carping*, that is, preparing teasles for the workmen, and pressing, that is, cleaning and drying the teasle rods and handles. The teasles are fixed to rods inserted in large cylinders, called *gigs*; these as they revolve, raise a nap on the cloth which is made to pass over them. A constant jet of water is kept on the cloth during this process, and the rooms in which it is carried on, are, consequently, wet and disagreeable. There is no need of describing processes so generally known as weaving, scouring, dyeing and cutting.

The only branches of cloth-finishing in which females are employed, are *brushing* and *burling*. Brushing needs no explanation. Burling is the removal, by hand, of any extraneous substance or roughness, either left by the weaver or introduced into the cloth during any subsequent operation. The brushers and burlers are generally young women from seventeen or eighteen upwards.

We shall now extract, or rather compile, from Thackrah on Longevity, (edit. 1832) the effects of the labour in these several processes on the health of the operatives; the authority of that work having been fully proved by the result of the inquiries of the Factory Commissioners,

---

\* Dr. Ure informs us that a slubbing machine has been invented, by which the pieceners will be emancipated from the capricious tyranny of the slubbers. We hope it will succeed.

Wool Sorters—No sensible effect produced on health.

Pickers, } Are as a body healthy and long  
Willers, } lived, but they suffer greatly in the  
the respiratory organs.

Combers.... The lungs suffer so much, that many persons cannot pursue the employ. Those however, who do, are generally healthy.

Carders, } These men are remarkably strong,  
Scribblers, } robust, and healthy. The children,  
Pieceners, } called pieceners, notwithstanding  
Slubbers, } their blue and greasy skins, are  
Spinnners, } found to be generally free from dis-  
ease. Indeed they appear stronger  
Warpers, } and plumper than any other children  
Sizers, } in towns.

Weavers, } Notwithstanding the poverty and  
(including } general reduction of health among  
sacking } the weavers, longevity is by no  
and plaid) } means rare.

Scourers, } They are not sensible of any ill  
Dyers, } effect. A few of the latter are af-  
fected with feverish maladies.

Burlers.... Long employment, injurious to the eyes.

Fullers or } Generally robust ; constitutional  
Millers, } disease rare.  
Boilers, }

Giggers—Are exposed to wet and vapour, yet rheumatism almost unknown.

Dryers—We rarely find an old man in a dry-house ; the labour and heat exhaust the nervous energy rather than induce organic disease.

Croppers—Little injured by their employment.

Singers\* .. The digestive organs often suffer but urgent maladies are rare. There are few old men in the employ.

Glossers\* .. Some youths cannot bear the employ ; some who persist, die in their prime ; fortunately, not numerous.

Frizers, } Noise of machinery and confine-  
(who raise a } ment affect the head and impair  
nap on cloth) } the appetite. They are intemperate, unhealthy, and short-lived.

Wool Pressers—Life is not abbreviated in a marked degree. Contraction or inflexion of the fingers is not unusual among pressers.

Brushers, } Often suffer distress in breathing.  
Steamers, } Lads look sickly. Do not suffer  
more than others from rheumatism, cold or pneumonia.

There are no data for ascertaining, with tolerable accuracy, the amount of capital engaged in the various branches of the woollen manufacture, but, we regret to say, that the Minutes of Evidence before the Lords' Committee, lead us to fear that this, once the staple branch of British industry, is both positively and relatively on the decline. To protect the British

wool-grower, a duty is imposed on the importation of foreign wool. But foreign wool is absolutely essential to the manufacture of cloths, and British wool is mixed with it in various proportions according to the fineness of the cloth. Foreigners already rival us in many of the continental markets, where England was once supreme ; indeed, it may be questioned whether the imposition of the duty has not been positively injurious to the wool-growers, for, the less foreign wool is imported, the less British wool must necessarily be bought to mix with it, Mr. Gott says—"There was no foreign wool used in Yorkshire when I first knew the trade ; the foreigners had the advantage of supplying the continent with fine cloth before the machinery was introduced ; and the West of England manufactured foreign wool for the supply of this country. After capital became involved in machinery, I took up the manufacture of foreign wool, without lessening our consumption of English wool ; on the contrary, I maintain that the introduction of foreign wool has tended to increase the use of English wool, and to raise the price of it." Several other eminent manufacturers confirmed this testimony, and showed how a duty on foreign wool not only injured manufacturers, but rendered British wool a drug in the market.

#### DEATH OF THE COUNTESS FERRERS.

In our obituary we have noticed the untimely death of this amiable lady ; but it is perhaps not generally known to our readers that a singular tradition is current in this most ancient and noble family, which, if not sanctioned by the established principles of sound philosophy, still claims a kindred with those more memorable events, in connection with which, it has been handed down from by-gone ages. The Park of Chartley is a wild and romantic spot—in its primitive state—untouched by the hand of the agriculturist, and was formerly attached to the royal forest of Needwood, and the Honour of Tutbury, of the whole of which the ancient family of Ferrers were once the puissant lords. Their immense possessions now forming part of the Duchy of Lancaster, were forfeited by the attainer of Earl Ferrers after his defeat at Burton Bridge, where he led the rebellious Barons against Henry the Third. The Chartley estate being settled in dower, was alone reserved, and handed down to its present possessor.—In the Park is preserved, in its primitive purity, the indigenous Staffordshire cow, small in stature, of a sand-white colour, with black ears, muzzle, and tips at the hoofs. In the year of the battle of Burton Bridge, a black calf was born, and the downfall of the great house of Ferrers happening at the same period, gave rise to the tradition, which to this day has been held in veneration by the superstitious reverence of the common people, that the birth of a particoloured calf from the wild breed in Chartley Park is a sure omen of death within the same year to a member of the Lords's family, and by a most remarkable coincidence a calf of this description has been born whenever a death has happened in the family of late years. The decease of the last Earl and his Countess, of his son Lord Tamworth, of his daughter Mrs. William Jolliffe, as well as the deaths of the son-and-heir of the present nobleman, and his daughter Lady Francis Shirley, have each been forewarned by the ominous birth of a spotted calf. In the spring of the present year an animal perfectly black was calved by one of this weird tribe in the Park of Chartley, and it has been followed by the death of the Countess which it is now our melancholy duty to announce.

\* Men employed in singeing clothes are exposed to a high temperature, and to some dust, which arises from the scorched wool. A thermometer, held at the distance which men usually stand from the cylinders, indicates from 130 to 140 degrees of heat, while the temperature in other parts of the room declines to that of the general atmosphere. Glossers, who smooth cloth by carrying it over heavy and heated pieces of iron, are subjected to high temperature and great labour. Their work, too, is generally in the summer.

## THE HANTS ANNUAL AGRICULTURAL CATTLE SHOW

Took place in a field at St. Cross, near Winchester, on Tuesday, June 30. The show was thinly attended, although the stock exhibited was good. The following prizes were awarded:—

To the farmer who had let the greatest quantity to labourers during the year—to the Rev. C. E. Lefroy, a cup of 5 sovs.

To the labourers who had brought up the largest families without parochial relief—to William Croucher, the first prize of 5 sovereigns; the second of 3 sovereigns to Thomas Jackson: and the third of 2 sovereigns to William Horper.

To the shepherd, who had alive the greatest number of lambs, in proportion to the number bred during the year, from a flock of not less than 200 ewes—the first prize of 5 sovereigns to T. Rose, shepherd of Sir Thomas Baring, Bart.

To the best mare, a cup of 5 sovereigns to Mr. Tredgold.

To the best South Down ram—a cup of 5 sovereigns to Mr. Saunders.

To ditto, under 18 months old—to Mr. Gale, a cup of 3 sovereigns.

To the best of any other breed—Sir Thomas Baring a cup of 2 sovereigns.

To the best lot of South Down ewes—a cup of 5 sovereigns to Mr. Houghton.

To the best ditto, under 18 months old—a cup of 3 sovereigns to Mr. Pain.

To the best of any other breed—a cup of 2 sovereigns to Sir Thomas Baring, Bart.

To the best Bull—a cup of 5 sovereigns to William Abbot, Esq.

To the best cow—a cup of 5 sovereigns to D. Bayley.

To the best boar—a cup of 5 sovereigns to C. S. Leffevre, Esq., M. P.

In the afternoon the members of the association dined together, at the George Inn, Sir Thomas Baring, Bart. the President, in the chair, Sir S. R. Jarvis, the Vice-President; William Abbott, Esq.; the Hon. W. Gage, and about 30 gentlemen connected with agriculture in this county.

## THE PRINTING MACHINE, OR COMPANION TO THE LIBRARY AND REGISTER OF PROGRESSIVE KNOWLEDGE.

London:—Charles Knight, 22, Ludgate Street.

We have not room for a detail of the contents of the number before us, but purpose to give entire a very interesting notice of Mr. Brande's late lectures on vegetable Chemistry at the Royal Institution. It will be seen—startling though it may at first sight appear—that excellent bread may be made from *saw-dust*:—

"In his last two lectures Mr. Brande fully treated of the proximate principles (chemical) of vegetables, and performed a number of beautiful experimental illustrations of what we may call the transformations of chemistry, by means of which we are enabled to convert the most apparently useless materials into important objects of the arts, particularly as they bear upon our domestic economy. In truth these transformations are among the marvels of modern science and what is far better are the most useful of her gifts, or we should rather say contributions to the general well-being. Take the manufacture of paper from useless rags, or of sugar from the same commodity, or of porcelain and glass from stones and clays, and who can say where is the limit to our power of turning to use and productive agency, the most apparently worthless and sterile parts of nature? "Who," says Sir J. Herschell, "would have conceived that linen rags were capable of producing more than their own weight of sugar by the simple

agency of one of the cheapest and most abundant acids?—that dry bones could be a magazine of nutrient capable of preservation for years, and ready to yield up their sustenance in the form best adapted for the support of life—that *saw-dust* itself is susceptible of conversion into a substance bearing no remote analogy to bread, and though certainly less palatable than that of flour yet no way disagreeable, and both wholesome and digestible as well as highly nutritive?"

Now though some years have elapsed since Dr. Prant called the attention of the British public to this curious discovery, by means of which "famine is rendered next to impossible" to quote the words of Herschell, I never heard it alluded to in any lecture on chemistry till last Saturday, March 21st, by Mr. Brande. Mr. Brande exhibited a cake made from *saw-dust*, which fully bore out the high commendation of Dr. Prant and its discoverer, Professor Autenrieth of Tubingen (see the Philosophical transactions for 1827). Though I should be the last person to aid any project which might tend to lower the standard of the diet of the industrious classes, I think the *saw-dust* bread merits a higher degree of celebrity than it has yet attained. It is certainly far more nutritious and might easily be made more palatable than the sole food of the Irish peasant—the potatoe. At all events it is a curious instance of the wonderful transformations of chemistry. Our wonder indeed will abate a bit when we recollect that *sugar, starch, gum arabic, wheaten-flour, wood*—that is *saw-dust*—*mannna, arrow-root and vinegar*, are composed of precisely the same ingredients, combined in very nearly the same proportions, so that if we were permitted to view, behind the scenes of nature the manner in which they are combined, we might be able to transform the one into the other *ad libitum*. This will perhaps appear more evident from the following table:—

| The finest<br>Sugar Candy | Wheat<br>Starch | Arrow<br>Root | Gum<br>Arabic | Wood. |
|---------------------------|-----------------|---------------|---------------|-------|
| Carbon, .. 42.85          | 63.55           | 44.4          | 42.23         | 42.7  |
| Water, .. 57.15           | 45.45           | 55.6          | 57.77         | 57.3  |
| 100 0                     | 100 0           | 100 0         | 100 0         | 100 0 |

*Saw-dust* is thus seen to differ very little in its chemical characters from those highly nutritious substances—*sugar, arrow root, wheat and gumb arabic*. Professor Autenrieth's method of cooking it into bread consists simply in first removing every thing soluble from the wood by frequent macerations and boiling. The wood is then reduced into a minute state of division: by minute division is meant a fine powder, which after being repeatedly subjected to the heat of an oven is ground like corn, when it appears to be a yellowish-white flour, this flour requires, like corn-flour, to be fermented with leaven with which it forms a uniform and spongy bread, which Autenrieth also states that wood-flour boiled in water forms a jelly which is in like manner very nutritious. Connected with this subject, Mr. Brande stated a fact which if it did not come home to the bosom of his hearers, came, as Mr. Cobbett said of the Corn laws, very near their bosoms—to their bellies. Very few, even of our *Udes*, know how to prepare *carrot-soup*—the *modus operandi* is a mystery. Mr. Brande, by the aid of chemistry, has however been able to discover the secret, which consists simply in adding a little alkali—common pearl ash will answer—to the soup when boiling. The vegetable matter enters into a chemical compound with the alkali, which is soluble in water; hence the rich and nutritious character of well-prepared carrot soup. I trust my female readers will be thankful for this useful suggestion."

## HORSE WARRANTY.

GLOVER V. PROCTOR.

This was an action on the warranty of a horse, which the plaintiff, a tailor, purchased of the defendant, a butcher, for 14*l*. Shortly after the purchase the horse was discovered to be unsound, and the plaintiff sent him to a livery stable, and wrote a letter to the defendant stating that fact. The defendant in his plea denied the warranty, but the plaintiff established it by putting in a receipt in writing in the following terms, signed by the defendant:—Received of Mr. Glover the sum of 14*l* for a horse warranted sound and quiet." Counsel for the plaintiff then called on the defendant to produce the letter written by the plaintiff when the horse had been sent to the livery stables, but the defendant declined (not having notice to produce it).

Under these circumstances Mr. Baron ALDERSON said that the plaintiff could not recover the price of the horse; he was entitled only to the difference between the present value of the horse and the price given for him.

Evidence having been given to show that the horse was worth 8*l* only, the Jury returned a verdict for the plaintiff—Damages 6*l*.

## MIDDLESEX QUARTER SESSIONS.

NICE DISTINCTION.—This was an appeal brought by the parochial authorities of St. Edmund the King and Martyr, in the City, against that of St. Michael, and the question was in which—if in either—a pauper had gained a settlement.

Mr. Adolphus for the appellants, said the case was rather curious. The pauper, Simeon Clark, had been a waiter at the George and Vulture tavern, Cornhill, and that house happened to be in two parishes, and the bed room in which the pauper slept, small as it was—was, also, strangely—in two parishes. The head waiter had at first engaged the pauper, but there being some dispute as to who should pay the master for the damage, Mr. Warrenner, the then landlord, took Clark into his service at 30*l* a year. The yearly hiring was so far proved, and it would be for him (Mr. Adolphus) to prove the other parts of the case by satisfactory evidence.

Simeon Clark, the pauper, said he had been a waiter for 16 or 18 months at the George and Vulture; at first he slept a few weeks behind the plate closet; but during the remainder of the term in a room up stairs which he had been told was in two parishes. His bed was behind the door.

A surveyor here described by a plan that that part of the room was in the parish of St. Michael, and not in that of St. Edwards. He surveyed by the parish boundaries.

Mr. M<sup>r</sup>William (a magistrate), inquired whether the bedstead was always behind the door—or whether it might not be rolled at any time within the year in the same room into the adjoining parish. (*Laughter.*)

It was proved the bedstead was a fixture on the spot described.

After Mr. Payne had taken some objections, the Court granted the appeal.

RICHARDS V. HULBERT.—Mr. Boteler and Mr. Richards appeared for the plaintiff in support of a motion in this case. The matter in dispute in a tithe suit had been referred to Mr. Tinney, by whom an award had been made on all the points except one. The plaintiff claimed a tithe in respect of agistments upon meadow land. The tithe of hay had been paid upon the land; but as it had been used for the purpose of pasturing barren cattle between the period at which the hay had been cut and that at which the land had been closed up for the growth of the new crop of hay, it was

contended that an agistment tithe had become due. It had been agreed between the parties that the decision of the Court should be taken upon the point. It was now insisted upon on the part of the plaintiff, that although the meadow land, having paid the hay tithe, was exempt from agistment tithe for the remainder of the same year, yet, that, as the year ended on the last day of December, the agistment tithe accrued due for so much of the next year as intervened before the growth of the new crop of hay, it being admitted that the land had been used for the purposes of agistment during the latter period. Mr. Dampier argued on the other side; and insisted that the exemption extended to the whole year, however reckoned, and that it was not to be regulated by the calendar year or the historical year—by the old style or new. The Lords Commissioners were of opinion that the same land which had paid the tithe of hay was *not* to be charged with any tithe in respect of agistment in the period between the two crops.

THE TITHE OF AGISTMENT PAYABLE AFTER HAY CROPS.—A recent decision in the Court of Chancery by the Lords Commissioners in the following case, is of great importance to graziers and farmers in general; and more particularly as to the occupiers of land in the parish of Farlington, to which the parties in the suit belong—the plaintiff, who is the rector of Farlington, having hitherto claimed Tithe of Agistment from Michaelmas to Lady Day, although the same lands had previously paid tithe of hay, a demand to which the parishioners have heretofore submitted to avoid being driven into the ruinous expenses of a suit in Chancery, where the tithe owner has his opposition of proceeding in preference to bringing a case before a jury of the country in a court more generally accessible to the defending party.

THE LAND TAX.—The vast and opulent county of Lancaster, wherein little more than a century ago Liverpool was no more than a fishing village, continuing to pay upon its original assessments, produces to the revenue something short of 21,000*l*. per annum land tax, including the rich and populous towns of Liverpool, Manchester, and Preston. The city of Bath pays but 433*l*. per annum to the land tax. The parish of Marylebone, with a rental of 720,000*l*. per annum, contributes but 492*l*., while the town of Winchelsea, where there are no more than forty or fifty inhabited houses, pays 405*l*. And again, the parishes of St. Andrew, Holborn, and St. George the Martyr, of which the rental is about 116,000*l*., pay land tax to the amount of above 9,000*l*. a year, or nearly 1*s*. 7*d*. per pound, Marylebone giving less than one farthing, and that once in three years. Again, the city of Westminster pays 63,000*l*. a year, and the whole of Lancashire, as above, but 21,000*l*. Instances of inequality like these, and therefore of injustice which calls for a speedy and effectual cure, might be multiplied without difficulty. The question, we trust, will not be much longer neglected.

OVERSEERS' ACCOUNTS.—The *Westmore-Gazette* states that the overseers of Ambleside, near Kendal, having requested the Poor Law Commissioners to inform them whether, by the 47th clause of the Poor Law Amendment Act, it was imperative upon the overseers to pass their accounts each time on oath, an answer has been returned by Mr. Chadwick, informing them that the quarterly accounts must be passed in all respects as the yearly accounts would be; and that in future the legality of every item will be closely examined into, and the overseers made answerable for all deficiencies.

## AGRICULTURAL LABOUR.

MR. EDITOR,—Having in my last letter attempted to show the only way by which the farmers can be relieved from the intolerable burden of poor rates and unprofitable hand labour—namely, by allowing every respectable and trustworthy labourer to occupy such a portion of land as will keep him a cow, and employ his leisure hours and those of his wife and children—I now presume to offer some remarks upon horse labour, by far the most expensive article upon a farm. In the present state of the kingdom, when such vast sums are drained from the pockets of the industrious portion of the community, every attention to economy is absolutely necessary, and also that every source of profit should be known, particularly that which arises from the occupation of land. I again repeat, that when the present most alarming state of depression in the price of agricultural produce is considered, it is not too much to expect that the landowners of every grade will lend all the aid in their power by lowering rents, and offering premiums for improvements of such kinds as may give to this industrious part of the community some remunerating profit, of which at present they are entirely deprived.

Breeding and rearing horses for agricultural labour is, I am convinced, from 30 years' experience and close attention, a matter of much more importance than is generally attached to it—a few (I hope not useless) hints only can be brought within the compass of a letter.

The nobility and gentry of England have made such astonishing improvement in breeding horses for the turf as to place them decidedly at the head of the whole world for size, beauty, and speed, which is proved by the extraordinary prices for which they are sold, not only in England but in foreign countries, by which large sums are brought into the pockets of the dealers. In every other line of business, with the single exception of agriculture, in which horse labour is necessary, *speed* is considered of the highest importance, but in none is it more necessary to be considered than in the business of the farmer. In a climate so variable as that of Great Britain, it is surely worth the consideration of the occupier of land, whether, with what is called a team, by which term I mean six horses, he shall be able to plough two acres of land or three acres—whether he shall lead 30 loads of manure or 40 in one day—and whether on the road they shall move at the rate of three miles an hour or two miles, that being the pace at which the old-fashioned heavy-heeled horses have travelled for ages past. I am desirous to show that horses of a superior kind may be bred and worked by farmers for a certain time, and then sold for large prices, making the team a source of profit, instead of being, as at present, a total loss, when worn out and sent to the dogs.

It is a well-known fact that a horse bred from a fine, active, well-shaped half-bred mare, of almost any breed, and a *superior through-bred horse*, may, by the time he is six years old, be made worth from one hundred to two hundred guineas and upwards, and that with care and good keeping he may be worked at the plough from the age of two years to five, without injury, thereby earning his keep, when what he sells for will be clear profit to the farmer. Many people imagine that when drawn young a horse is injured in his shape and gait, this, from long experience, I deny, *if kept in good condition*, without attention to which, every

plan connected with horse labour must prove abortive. I could name to many gentlemen in the counties of Leicester, Nottingham, and York, particular horses, and not a few, whose high qualities in the field as hunters will never be forgotten, which were purchased at prices from one hundred to two hundred and fifty guineas each, all of which had been bred and worked by farmers at the plough, up to the ages of four and five, and some of them very hard indeed from two years old. *A large half-bred colt of my own in one instance I had broke into plough at eighteen months old only*, and sold him at four years old to a London dealer for 80 guineas, which, as he had worked for his keep, I considered clear profit. Although the introduction of steam conveyance on railways will materially lessen the number of draught horses, still the demand for superior horses will always be great, for hunters, for private carriages, for the army, and for exportation. Stage coaches used formerly to finish the career of horses that had been used for every other purpose, and many still continue to do so; but for the mails and the more rich and spirited coach proprietors, horses of the description I am advocating are found to be the cheapest, although purchased at high prices. Only look to the profit made by dealers in matching horses for the carriages of the nobility and gentry—it is *immense*, and with some attention and encouragement on the part of landed proprietors might be brought into the pockets of their tenantry.

Every kind of land, with the exception of the strong clays, can be worked by two horses abreast, or double, as easily as with three single. In this case six horses will plough three acres per day instead of two. This plan is generally adopted in Scotland, where, *unquestionably, they are the best farmers in the world*. Some years ago a Noble Marquis, who has a large landed property near Burton-upon-Trent, sent a Scotch agent to instruct his tenantry, and *insist* on their ploughing with two horses double. At first they were a little refractory, and thought it an arbitrary act of interference. I was acquainted with several of them, and in a few months they acknowledged they were obliged to his Lordship, finding it a great saving in time and expense.

I shall conclude by suggesting to the nobility and gentry that it would be a most desirable object to give *handsome premiums* at their agricultural meetings, or perhaps institute more generally ploughing matches, where prizes adequate should be given for the best pairs of half-bred two, three, four, and five year old horses, that have been regularly worked—size, shape, condition, &c., to be considered; and also for those which should plough an acre of land in the shortest time without distressing them. Another and very desirable object would be gained by this plan. Gentlemen would always know where to purchase sound and well-broken horses for almost every purpose, and the still more desirable satisfaction to feel that they would be putting sums of money into the pockets of their industrious and respectable tenantry, instead of encouraging the cheats and quirks of a set of profligate horsedealers.

In my next I shall offer observations on the best and most economical method of feeding farm horses, which, I humbly conceive, admits of great improvement.—I am, Sir, &c.

May 30.

F. C.

## CURRENCY.

Mr. Editor,—It is often asserted by the Minister of the day, and the assertion is repeated with exultation by the advocates of things as they are, that taxes have been taken off to the extent of many millions since the conclusion of the late war. Let us examine, however, and we shall find that the net revenue paid into the Exchequer in the year ending the 10th of October, 1834, was 43,340,000*l.*, and that the net revenue paid in for the year ending the 10th of October, 1817, was 43,840,000*l.* The *nominal* amount, therefore, was nearly the same after 17 years of peace as it was in the year 1817, notwithstanding our boasted reduction of taxes; and if the income or means of the country had remained stationary, the pressure upon it would not be in the slightest degree diminished. All we could in that case say would be, the pressure is varied, but its weight remains the same, and an argument would thence, I think, be afforded in support of Mr. Robinson's proposition for reconsidering our whole scheme of taxation. The weight, however, of taxation must be considered with reference to *the means of sustaining it*, or we shall have a very imperfect and inadequate notion of the true position of the country either now or at any future period; and it is with the view of making this point clear that I now trouble you with a few observations intended to elucidate the following calculations, founded upon authentic documents, already in the hands of Members of both Houses of Parliament, I mean Mr. Porter's valuable compilation of important papers to the end of 1833, lately laid before Parliament. In this book I find the average price of wheat and the average amount of taxation for the periods mentioned to be as follow :—

|                                                                            |         | Millions.                                           |
|----------------------------------------------------------------------------|---------|-----------------------------------------------------|
| 10 yrs. ending 1799, the<br>av. price of wheat per<br>Winchester qr. was.. | 55s 11d | 23½                                                 |
| 20 yrs. ending 1819 do.                                                    | 35s 6d  |                                                     |
| 10 yrs. ending 1829 do.                                                    | 58s 5d  |                                                     |
|                                                                            |         | The av. amount of<br>taxation annually<br>was ..... |
|                                                                            |         | do. 55½                                             |
|                                                                            |         | do. 58½                                             |

Estimating the money income of the country for the first period (when wheat was 55s 11d) at 120 millions annually, the income for the next 20 years (when wheat was 35s 6d) would be within a small fraction of 200 millions annually, and the income for the 10 following years (wheat being 58s 5d) would be 136 millions, and consequently the pressure of taxation upon the means or income of the country during the periods specified would stand as follows :—

For the 10 years ending 1799 about 18 per Cent.  
For the 20 years ending 1819 .... 27½  
For the 10 years ending 1829 .... 41

If I have stated this case fairly, what becomes of the boasted relief afforded to the country during the last 18 years? This statement shows clearly, and I think unanswerably, that the weight of taxation during a most expensive and destructive war of 23 years' duration, was nearly 40 per cent. less than during the 19 years of profound peace which have followed; and that if we estimate the income or means of the country by the present prices of wheat, or by the average prices likely to exist during succeeding years, the pressure of taxation must be still more fearfully increased. *The rent of land must be annihilated, and the farmer will find himself reduced to the lowest grade of the labouring poor.*

To prevent any objection that may be urged

against the taking of wheat only as evidence of a declining income, I beg to observe that precisely the same results follow if we take *meat* as the basis of calculation. The prices of meat for the last century will be found in the book already referred to.

I need hardly say that the cause of this frightful decline in the money income of the country, and the consequent enormously increased weight of taxation, is solely to be found in Mr. Peel's Bill; and *until that Bill be repealed or modified, no human effort can effect any substantial relief to the country.* To talk of the prosperous state of trade, in contra distinction to the distressed state of agriculture, is absurd. No branch of industry can be prosperous in any country where the hand of taxation takes 40*l.* out of every 100*l.* of the country's income; and this, I venture to believe, is the actual state of England at the present moment.

If you should think this letter deserving insertion in your widely-circulated Paper, I propose at an early day addressing you again, suggesting the means of affording substantial relief to the country, without doing injustice to any branch of the community. Meantime, I remain, Sir, respectfully yours,  
OBSERVER.

AGRICULTURE.—John Ellman, Esq. of Sussex, was considered to be the best practical Agriculturist in England,—independent of his agricultural knowledge, he eminently distinguished himself as a breeder of stock, and gave to the South Down sheep that value which they at present possess. No man seemed better calculated to take a lead among Agriculturists in watching their interests and in conducting the improvements made in agriculture. Before he retired from his farm, after fifty years practice, he often expressed his opinion that Agriculturists would feel the pressure of the coming times, and the only means to be adopted to avert the blow, would be by increased talent and perseverance—by improving the plans of farming and increasing agricultural information. After he retired from business, he carried into practice his opinions, and generously employed his pen in detailing his own experience, and in calling upon the other eminent men of the kingdom to unite in the labour,—his request was not in vain. Together with this assistance, the valuable work entitled *Baxter's Library of Agricultural and Horticultural Knowledge* was published, and contains the best practices in farming, breeding, and all the other departments in agriculture, that has ever been produced for the benefit of the farmer. The highly esteemed yeomen live to see his labours appreciated by two editions of the work. In the third edition we see there is attached a Memoir of him, and is worthy the close attention of every farmer in the kingdom. No farmer will be doing justice to himself unless he consults this work, for we are satisfied that although the low prices of corn produce is disheartening in the extreme, yet by adopting the valuable suggestions in the work, much may be done to surmount the difficulties of the times. To every person connected with rural affairs it must prove a valuable guide, as every article is written by practical men only. The work not only possesses these rich stores of information on farming, but it also has extended itself to Gardening, Forest and Fruit Trees, Pruning, &c. and here we also see the master-hand of experience employed. In short, in all its departments it realizes the full design contemplated by Mr. Ellman.

## WOOL FAIRS.

**LEICESTERSHIRE WOOL FAIR** was very numerously attended. The quantity of wool brought in the bulk was about 10,000 fleeces, of which 6,500 were sold, besides which, samples of nearly 5,000 were brought to the fair, and 2,400 disposed of. In the whole, 69 lots were bought, 63 in the bulk, and six by sample, more than two-thirds of which were sold by six o'clock. Hogs were most in demand, ewes and wethers were dull sale. The President (H. W. Wilson, Esq.) sold his lot, the ewes and wethers at 15d per lb and the hogs 19d per lb; on the whole the average of the sales effected may be considered from 40s to 42s per tod. The greatest buyer on the occasion was Mr. Vinree, of Atherstone. The arrangements of the fair reflected the highest possible credit on the stewards, R. H. Bird Esq., T. Miles Esq. and Messrs Gamble and Rogers, as well as on the secretary, Mr. Hesketh. About three o'clock, the company adjourned to the Bell Hotel, where a sumptuous dinner was provided by Messrs. L'Hermite and Boyer. Upwards of 200 gentlemen sat down, among whom were—H. W. Wilson Esq. (Chairman); C. W. Packe, Esq.; J. G. D. B. Danvers, Esq.; C. Winstanley, Esq.; R. Cheslyn, Esq.; Sir W. Dixie, Bart.; Col. Burnaby; J. A. Arnold, Esq.; R. F. Wood, Esq.; — Butler Esq.; T. Godfrey Kemp, Esq.; A. Smith Esq.; E. W. Wilmot, Revs. Adnutt, Thorpe, Raworth and Blount, &c. &c. The meeting taking into consideration the quantity of wool remaining unsold, determined upon an adjourned Fair, which was to be fixed by the Committee.

**HEMEL HEMPSTEAD WOOL FAIR.**—There was an immense quantity of wool in bulk offered for competition at this fair. The Earl of Verulam sent 1213 fleeces; Countess of Bridgewater, 1397; Earl of Essex, 948; Marquis of Westminster, 780; Marquis of Bute, 500; Messrs. A. and H. Fraser, of Flamstead Bury, 1753; Mr. B. Weal, of Pinner, 1474; Robert Sutton, Esq. Rossway, 1153; Mr. Yardley, of Wingtree Grove, 1508; Mr. J. Weal, Pinner, 1059; Mr. John Reeve, Hutton Bridge, 700; Mr. Betts, Langley, 702; Mr. Proctor, Wingham, 680; Mr. Newman Hatley, Langley Lodge, 612; Mr. Somes, 628 fleeces. Wool in smaller quantities, was also sent by J. Woodman, Esq. of Rickmansworth; Mr. Peppercorn, Little Gaddesden; John Dickenson, Esq. Nash Mills; E. Rogers, Bushey Hall; Captain Sullivan, Langley Bury; Mr. Smith, Ward's Hurst; Peter Clutterbuck, Esq. New House; Mr. Bennett, of Lewsey Farm; Sir A. Cooper, Gadsbridge; J. Smith, Esq. Kingsbury; J. Muir, Esq. of Abbott's Langley, and John Hawkins, Esq. of Bye Lands.

The principal woolstaplers in the county were present, and many who had travelled from more distant parts purposely for the occasion. Notwithstanding the demand for wool they displayed great shyness in making purchases, and much tact in endeavouring to keep the farmers in the dark as to what prices they intended to give. The farmers stood firm, and but few, if any, gave way, the consequence was that the day's business may at least be said to have been dull. The following may be quoted as the prices on the average:

Long and Short Wool Ewes. . . . . 40s. per tod.  
Southdown Teg. . . . . 48s.  
Half-bred Ditto. . . . . 50s.

About 150 gentlemen afterwards sat down to dinner at the Rose and Crown, the Hon. Granville Ryder in the chair, and on the removal of the cloth the usual loyal and constitutional toasts were duly honoured. As regarded the immediate object of the meeting, the chairman, in proposing "Prosperity to the Hemel Hempstead Wool Fair," said, "Owing to the establishment of wool fairs in the county of Hertford, the wool grower was enabled to get a better price for his wool than he had prior to their establishment, been in the habit of doing; and the wool buyer was enabled to effect a considerable saving in his expenditure in not having to incur the expence of going once, twice, or thrice to the different farmers before he could agree

with the farmers as to the price at which the wool was to be furnished. He had now the opportunity afforded him, with little or no expence to himself, of making what purchases he pleased from the wool brought to the fair in bulk, or sample, at such prices as would afford the wool seller a fair remuneration, and the same as wool was in general known to realize elsewhere. He (the Chairman) had to add, that some gentlemen had entered into a subscription and purchased a silver cup, which was intended to be presented to the person purchasing the greatest number of fleeces by six o'clock in the evening. In conclusion, the Honourable Chairman proposed "Prosperity to the Hemel Hempstead Wool Fair," which was drank with considerable acclamation.

The Plough and the Fleece—the Hertfordshire Agricultural Association—Mr. Bennett and the Bedfordshire farmers—The Marquis of Chandos—The Wool-buyers that attended the fair that day—and other toasts having been successively drunk, and acknowledged with appropriate remarks,

Mr. G. Howard said he was instructed by the chairman to state that Mr. Waller was the largest wool-buyer that day, he having purchased 5653 fleeces. Last year he bought 7300 fleeces, and Mr. Osborn 7500. This year 43,000 fleeces were offered in the market, and Mr. Waller had, consequently only purchased an eighth of the whole bulk; last year he had purchased a quarter.

The Chairman, Mr Sutton, (the Hon. Granville Ryder having retired,) then presented the Cup, which was quite plain and much admired for its neatness, to Mr. Waller, who in acknowledging the present, said that the prices offered for wool that day, were higher than what had been given last year.

**HITCHIN WOOL FAIR.**—The show of Wool was equal, both in quantity and quality, to that offered for sale last year, the number of fleeces sent being 25,660. The woolstaplers were exceedingly backward in making purchases. The prices obtained varied from 35s to 39s for ewes, and from 45s to 49s for tegs. Most of the business was transacted after the dinner. The Marquis of Bute, Lord Dacre, and several landowners of distinction, encouraged the fair by sending their wool for sale. F. P. Delme Radcliffe, Esq. presided at the ordinary, at the Sun Inn, which was very respectfully attended.

**HERTFORD WOOL FAIR.**—In consequence of the very favourable state of the weather, both for grower and buyer, the Market-house was filled with Wool both in bulk and sample. The Marquis of Salisbury was the largest wool proprietor present, his Lordship having no less than 1226 fleeces for sale; A. Smith, Esq. M. P. Woodhall, had 1162 fleeces; Mr. J. Hill, of Whitwell, 1167; Mr. E. D. Rayment, of Bedwell Park, 1096; Mr. G. Newman, Hertford, 1050; Mr. Latimer, Bride Hall, 830; Sir Abraham Hume, 614; Earl Cowper, 552; Lord Dacre, 721; Mr. Webb, Hatfield, 574; Mr. Archer, Hatfield, 510; Mr. Kirkby, Epping Bury, 405; Lord Melbourne, 435; and Mr. Lythgoe, Ware Park, 520 fleeces. G. J. Bosanquet, Esq. Broxbourn, Sir C. E. Smith, Bedwell Park, Captain Hotham, S. Hanbury, Esq. G. C. Thornton, Esq. W. Blake, Esq. and several other gentlemen and farmers had also wool, in smaller quantities, at the fair. The total quantity did not quite equal that offered for sale last year. The trade was nearly as dull as at Hemel Hempstead and Hitchin Wool Fairs. What wool was sold fetched something like two shillings a tod better prices than were obtained at Hemel Hempstead, and may be quoted as under:

Long and short-wool Ewes. . . . . 40s per tod.  
South Devon Teg. . . . . 50s  
Half-bred Norfolk Teg. . . . . 52s

A numerous company afterwards dined together at the Salisbury Arms, the Noble Marquis of Salisbury in the Chair.

After the customary toasts, Sir Culling Smith proposed the health of Messrs. Elkington, woolstaplers,

of Hertford, and offered them 46s all round, or 51s for the first class, and 38s for the Second. Mr. Elkington, jun. would give 43s all round, which he considered the outside price.

Lord Salisbury said, he had come to the fair without any expectation of selling, as he was aware there was a combination among the woolstaplers not to purchase at the price given last year; but as there was a very considerable demand for wool, particularly from America, he would not suffer his wool to go at less than last year's prices; and if not so sold, he would send it to the London markets, where there would be no fear of any combination existing.

Mr. Elkington said wool, in his opinion, was worth 4s to 5s per tod less than last year.

After a few observations from R. G. Alston, Esq. and Captain Hotham, a woolstapler attending to buy wool for Mr. Weston, of Biggleswade, one of the largest buyers of last year, denied the existence of any combination to put down the Wool Fair, and he was prepared to buy largely that day, but not at last year's prices, as his employer had lost money by the wool he then purchased, and stood a good chance of losing more this year, if the prices asked were acceded to.

The Marquis of Salisbury then proposed the health of the "Woolstaplers attending the Fair," which being duly honoured, the Noble Lord said, he had been requested by the Committee for managing the Wool Fairs generally to state that next year they should be glad to meet the woolstaplers at the dinner. The company shortly afterwards separated.

In the evening Mr. Elkington, of Hertford purchased between four and five thousand fleeces of the Marquis of Salisbury, Sir Culling Smith, Bart. Sir A. Hume, and George Byng, Esq.; giving a price somewhat under that asked by the woolgrowers generally in the morning. A great quantity of wool was thus privately disposed of at prices very nearly equal to those quoted in the reports.

**AYLESBURY WOOL FAIR.**—Aylesbury Wool Fair was well supplied with Wool, there having been during the day about 25,000 fleeces, 7,000 more than last year, the value of which was estimated at 10,000*l*. The prices were rather dull in the morning, but they advanced towards the close of the day. The greatest buyer we heard of was a gentleman who purchased 1,000 fleeces on his own account. Among the company present at the dinner at the George, were the Marquis of Chandos (who was in the chair) and Mr. Rickford, M. P. Mr. Horwood announced that the Noble Marquis had presented a splendid silver cup to the Committee to be given to the largest buyer or grower of wool, as the Committee might think fit. Mr. Rickford proposed his lordship's health, which was drunk with three times three.

**IPSWICH WOOL FAIR** was held in the New Assembly Rooms, the Earl of Stradbroke presiding at a cold collation provided at the Great White Horse, and among the company were—Lord Rendlesham, Sir T. Gooch, Sir J. Rowley, a long list of agriculturists; and among the wool-buyers were—Messrs. Revans, Yoxford; Burch, Tuddenham; Buck, Beccles; Lamb, Loddon; Gardener, Thetford; Etheridge, Starston; Freeman, Ipswich; Alexander, Ipswich; Churchyard, Petistree; Capon, Dennington, &c. &c. After "The King" and other loyal toasts had been honoured, Lord Stradbroke gave "Prosperity to the Suffolk Wool Fair," and in so doing briefly adverted to the advantages derivable from the establishment of a wool fair in the county. He said, it frequently had occurred that the grower of wool sold his commodity in perfect ignorance of its value, from the mere hearsay of his neighbour; but at meetings of this description every one brought his stock of information, and considerable knowledge upon this subject was obtained. The Noble Lord offered his wool (all flock) at 42s to Mr. Revans, who considered it far too high-priced; he had in the last two months sold wool, for which he last year gave

40s and 42s for 33s; he must therefore decline his Lordship's offer.—Mr. J. Moseley then offered his wool to Mr. Revans at 56s the hogget, and 42s the flock. Mr. Revans again declined, and warned the wool grower against asking too high a price for his commodity; it would recoil upon themselves; he was satisfied the terms offered were such as the buyer could not meet.—Sir Thomas Gooch offered his wool to Mr. Revans at 52s and 40s. Mr. Revans said, although this was much below other offers, still he could not accept it.—Mr. Moseley asked why wool was so much lower this year than last? Mr. Revans said he would answer the question fairly. Last year he protested against the price given at this fair for wool, and it was only because the fair was in an infant state, and he wished to promote it as far as he could, that with the view of effecting some sales he was induced to give the price he had given. He gave up on that occasion his better judgment, with the view of furthering the fair. It was well known that not long after the fair a re-auction took place to the extent of full 10s a tod, and in few instances had he been able to make the price he gave at the last fair.—Mr. Lamb, of Loddon, said there was much over-speculation last year, and the wool buyers were not now disposed to commit the same error. It almost appeared to him that the Suffolk Wool Fair was established with but one object—the benefit of the wool grower; if such were the case, it must fall to the ground, for wool buyers would not attend. There had been a fall in the price of wool within the last two months; hoggets which were sold at 56s had fallen to 52s 53s or 54s and ewes from 35s to 30s or 34s.—Several offers were made, but the buyers declined purchasing on the terms proposed, generally estimating the prices at from 3s to 5s less than offered. The only sale effected was by Mr. Julian, who sold 300 half-bred Down Leicester hogget fleeces at 52s.

**PERTH NEW WOOL FAIR.**—This fair, which took place on Tuesday here, has opened auspiciously, a much greater number, both of buyers and sellers came forward than was anticipated by the most sanguine. Not a few of the principal wool-staplers, manufacturers, and commission agents from various districts in England, and from Bannockburn, Kilmarnock, and other places in Scotland, where the woollen manufacture is carried on to the greatest extent, arrived in course of Monday, and transactions to some amount was done that evening. The principal place appointed for business was the Council House, and early on Tuesday the streets in that neighbourhood exhibited a very stirring appearance—the number of sheep farmers from the Highlands being very great, and there being also a considerable influx of country gentlemen from various quarters, anxious to countenance and encourage the market. A good many samples were exhibited in the Council Room, and several farmers and country gentlemen who do not make the produce of wool their particular object, brought forward their stock in bulk; while, we understand, the southern dealers complained that not a few of the principal wool-growers presented no specimen at all, but merely described the kinds and quantities. Large quantities were offered for sale: one sheep-farmer from the Highlands of our own county, we are informed, had upwards of 6000 fleeces. Upon the whole the purchasers were rather shy as to closing positive bargains till the result of the Inverness market be ascertained; and there was not that quantity bought and sold, which from the congregation of dealers, might be supposed. So far as we could learn, prices were about 3s. per stone on Highland, and 6s. on fine wools, under the average rates of last year. The current prices may be quoted as follows:—

|                               |                    |
|-------------------------------|--------------------|
| Highland Laid and White Wool, | from 22s. to 24s.  |
| Leicester,                    | ..... 34s. to 36s. |
| Cheviot Ewe and Hog,          | ..... 32s. to 34s. |

Some finer qualities of the last as high as 38s.—all per stone of 24 imperial lbs. The principal purchases were made by Scottish manufacturers,

## PETERBOROUGH WOOL FAIR.

The first Wool Fair was held on Saturday the 11th of July, according to the resolutions agreed upon in March last, and we regret to say, that owing to the scarcity of buyers and the dullness of the trade, scarcely any business was done. At three o'clock, 139 gentlemen sat down to an excellent dinner, in the large room at the Greyhound Inn, Lord Fitzwilliam in the chair, and on his right was Sir Culling Smith. Mr. Thos. Fullard, vice-president. After dinner, the chairman gave the "King's health,"—"the Queen's"—"Princess Victoria, and the Royal Family." After which, his lordship rose and said, "Having done our duty to the race under which this country has enjoyed prosperity, that is, generally speaking, I have great pleasure in proposing the healths of a body of men to whom we feel obliged for their sanction on this occasion, viz., 'The gentlemen wool-buyers who have attended here to-day.'" Mr. Phillips returned thanks, and "was sorry the dullness of the trade prevented them meeting the present prices asked by the graziers for their wool, but hoped at a future time to be able to deal with them." Sir C. Smith proposed the health of "Earl Fitzwilliam," and hoped he would set the example of offering his wool at such a price as would lead to bargains being made," three times three. Lord Fitzwilliam, in returning thanks, said, "I cannot but feel exceedingly gratified at the manner in which Sir C. Smith's proposition has been received, and for which I beg to thank you sincerely; and as this is the first time we have met together upon the business before us, and as I have been one of those who have endeavoured to establish this fair for so important an article of produce, it may not be out of place if I state the grounds on which I have been anxious to place the commerce of wool in this neighbourhood, on the same footing as it is in many other places. I have not been led to make this arrangement with any view of giving one party any advantage over the other, but solely from a conviction, (and that conviction arising from the many opportunities I have had of making observations in commercial matters), that no plan has yet been adopted so much to the mutual benefit of both buyer and seller as that of *openmarket*, where the seller may meet with competition for the article he has for sale, and where the buyer may see variety in the article of his purchase. Now it will not be denied by any amongst you, that considerable convenience arises in conducting commerce by travelling from village to village, and from house to house at great expense and sacrifice of time, added to which, the no less disadvantage to the seller under that system, from the frequency of his being from home when the buyer may chance to call. Looking at these circumstances, you will, I think, agree with me upon the good results likely to arise from an open market; there is another advantage, that upon an occasion like the present a greater proportion of knowledge may be gained by farmers of the state of those classes of society which affects the value of agricultural produce, and, on the other hand, the dealers in wool have a like opportunity of becoming acquainted with the state of the growing class; for this day cannot pass off without every one here having gained some knowledge, which he could not have done had he been absent. These are the grounds which have induced me to take the steps I have, and at the same time, let me say, I have had the co-operation of individuals of weight in the neighbourhood to carry into effect this desirable mode of commerce. There has at present been much less business done than might have been expected, but from so many having met, I consider it a fair proof that there are many who coincide with me in opinion upon this subject. I cannot quite agree with those who say that the state of Yorkshire is not prosperous; for though I do not live immediately in the district of the wool manufacturers, yet I have so much connexion with it, that I am able to say that for several years back the manufacturers have enjoyed comparative prosperity. Wool has of late been the mainstay of Agriculturists, and one cause of the high price of it is the prosperity of the manufacturers, and the other is the

diminution in that article, which arose from the serious losses of sheep during 1831, 32, and 33; these are the two causes of wool having been so much higher in proportion to any other article of produce; but now the growth of wool exceeds that of three years ago, because the graziers have reared so many sheep to make up for the losses I have mentioned, and the market is restored to its former state as between demand and supply. I will venture to say, that if the fleeces of this year's clip could be counted, the amount would be more than that of three or four years ago. The manufacturer has his eyes open to all these circumstances which may effect his profits, he takes more means of inquiring into the state of society than the farmer does, and as a proof of this, there is not a manufacturer in Leeds who does not anticipate a reduction in the price of wool from the information they possess of the increased growth of wool to come into the market, and, therefore, it is that they bid lower prices. I, as a dealer, will state the price that I shall be happy to offer my wool at, viz. 39s, and as there is one present to whom I confide that part of my business, I beg to refer any buyer to him for the details, which I do not possess." His lordship then gave "Success to Agriculture."—W. Whitting, Esq. rose and said, "The noble lord has given me permission to propose a toast, and I take this opportunity to express my gratitude as an agriculturist to those noble individuals who have by their names and sanction given support to the wool fair. I fear that farmers have been, and are, sailing in a bad vessel, and they will be lucky who make a good escape from it, and looking at the depression under which those who get their living by agricultural pursuits are labouring, we ought to feel doubly bound to those, who in this time of need have come forward to promote our interests, and I will mention the names of the noble chairman, the Duke of Bedford, Marquis of Exeter, Lord Westmoreland, Earl Aboyne, Sir Culling Smith, and in the name of them all, have the pleasure to propose the health of the hon. baronet on the right of the chair, 'Sir C. Smith.'" Sir C. Smith returned thanks, and alluded to the mutual benefit that must arise from the meeting together of growers and manufacturers.—Earl Fitzwilliam, "Therefore, I cannot do better than give 'the Fleece and the Loom.'" The Vice President rose and said, "It gives me great pleasure to see Lord Fitzwilliam condescend to come amongst us, I should be very glad to see some business done; it only wants a beginning. Wool is lower in value, and if you lower your prices you will find purchasers; do as a large farmer (who I am glad to see here) did at Bedford, when I was there last week, he said, he was come to sell his wool, and set his price, saying, 'if that won't do, I will take less, for I am come to sell;' the result was, that a bargain was soon made. I have mentioned this to induce many present to do the same, and I will, with permission, give the health of the gentleman alluded to—'John Negus, Esq.'" Mr. Negus returned thanks and confirmed what Mr. Fullard had said. He then offered his wool to Mr. Mumford at 52s and 46s, which was declined. Mr. Whitting offered his clip of 1500 fleeces (700 wethers and 800 hogs) at 40s, for which Mr. Phillips bid 38s. Mr. M. Wells addressed the meeting, and in an appropriate speech pointed out the benefit to the country around, but more especially to the Fens, if a Spring Fair could be established in Peterborough, and proposed "that a fair be holden in this city annually in the Spring for the sale of cattle, wool, and other merchandise, and that a Committee be appointed to carry the same into effect, and that Earl Fitzwilliam be requested to take the chair." Lord Fitzwilliam read the proposition to the meeting, and said, "he was by no means adverse to Mr. Wells' motion, but thought the present meeting not competent to come to a *positive resolution* upon the subject, but as there were many points to be considered, suggested that a Committee be appointed to inquire into the propriety of holding a fair in the spring;" his lordship repeated his approval and a Committee was named. Mr. Wells thanked his lordship for the manner in which he had entertained the proposition, and had pleasure in giving "the health of

Lord Milton." Lord Fitzwilliam returned thanks, and regretted that business in town made it impossible for Lord Milton to be present. Mr. Whitting offered to meet Mr. Phillips' bid, and would take 39s for his wool, which was declined. Mr. Leighton offered his wool (which was fine) to Mr. Mumford, viz. 300 half-breds, at 52s; 200 South Down Hogs, at 48s; 120 half-bred Wethers at 38s, for which Mr. Mumford bid, 50s, 46s, and 35s. A discussion upon holding another Wool Fair arose, and it was finally agreed upon that for this year it should be held on the second Fair Day in October, and that it would be better to take a more deliberate opinion before the day should be fixed for future years.

### BUCKINGHAM WOOL FAIR.

This annual fair took place on Friday, July 11, and a large quantity of wool was pitched in the market-place. At two o'clock a large party (between 100 and 200 persons) dined in the Town-hall, George Morgan, Esq., in the Chair. Sir Harry Verney was also there, and a large body of the most respectable yeomen of the district. On the removal of the cloth the usual loyal toasts were given, after which Mr. John Brickwell read a letter from Lord Chandos, stating his regret that he could not be present at the fair, and announcing his intention to give a silver cup annually as a prize. Mr. Brickwell then proposed the health of Lord Chandos which was heartily cheered.—The Chairman said that he fully believed Lord Chandos to be the best friend the farmers ever had. (*Cheers.*) The Chairman then said there were gentlemen who stood between the clothiers and the wool growers: the latter only asked for a fair price, leaving to the buyer a remunerative profit, and he was confident that these gentlemen were prepared to offer a fair price, and he hoped that much business would be done.—Sir H. Verney then proposed the health of the Chairman. (*Cheers.*)—Mr. Morgan returned thanks, expressing his willingness at all times to serve the cause of agriculture. (*Cheers.*) For eighteen years he had acted as a magistrate, enforcing the Poor Laws, he hoped, with impartiality. Now that function he was no longer to fulfil, but he should always be ready and anxious as a magistrate or otherwise to assist the farmer by every means in his power. (*Cheering.*)—Mr. Box, the Secretary to the Committee, then offered various parcels of wools, reading the quantities and the prices asked.—The Chairman then proposed the health of Sir Harry Verney. (*Cheers.*)—Sir Harry Verney returned thanks, hoping that all meetings of this sort would increase, as they were very beneficial, and in every way calculated to be beneficial. He trusted that the farmer would soon have a visible improvement in his condition, and that agriculture would become once more flourishing. (*Cheers.*)—'Health of the Buyers.'—Mr. Bartlett returned thanks. He was sorry that the buyers could not this year give the prices the farmers asked. The trade was flat at present. Last year the staplers incurred a serious loss, which made them more cautious now.—Many other toasts were drank and some good songs sung. The meeting broke up about six o'clock. We find that the average of the wool sold was 40s 6d per tod. The bulk was considerably greater than last year, and more sold in bulk and in sample, but the number of fleeces could not be ascertained as the account was not taken as they came in, but as they were sold. Mr. Bartlett was a large buyer.

**SHREWSBURY WOOL FAIR.**—The quantity pitched was very considerable; prices were from 15d to 16½d per lb for strong Combing Fleeces; a few lots of a superior quality sold as high as 17½d per lb. Lamb's Wool sold from 14d to 15½d per lb. A good deal went back owing to the price not meeting the expectations of the growers.

**AT CHURCH-STRETTON FAIR** the sales of Wool were extensive, and prices fully 18d to 2s per stone of 15lbs, lower than last year.

**AT NORTHAMPTON WOOL FAIR**, a great number of samples of five fleeces of each sort of wool were exhibited on the Market Place. The purchasers seemed to think the prices asked higher than they could afford to give. Between 80 and 90 persons, growers and buyers of wool, dined together at the George Hotel—Mr. C. Hillyard in the chair. After dinner many lots were offered for sale, but six lots only were sold, and all those were bought by Mr. G. Peach, of this town. The following are the particulars:—

| Sellers.            | Fleeces. | Tegs. | Ewes. | Prices. |
|---------------------|----------|-------|-------|---------|
| Mr. N. Potterton.   | 399.     | 300.  | 99.   | 45s     |
| Mr. B. W. Potterton | 294.     | 253.  | 41.   | 46s     |
| Mr. Robt. Rogers    | 383.     | 193.  | 190.  | 42s     |
| Earl Spencer        | 720.     | 320.  | 400.  | 42s     |
| Mr. Redgrave        | 300.     | 140.  | 160.  | 44s     |
| Mr. S. Pell         | 320.     | 160.  | 160.  | 42s     |

### A WORD TO FARMERS.

TO THE EDITOR OF THE READING MERCURY.

Mr. Editor,—Allow me, through the medium of your excellent paper, to state, that in a conversation lately with an intelligent agriculturist, on the distressing complaints of the farmers, I was stung with a remark he uttered with considerable emotion, "that the farmers are a race of fools;" but, on reflection, I fear it is lamentably true.

Though we are suffering embarrassment that must speedily (if not relieved) involve us in ruin, yet we adopt no means to avert the impending calamity. Have we not, in time past, quietly looked on while the monopolists have glutted our markets with foreign corn, at a price that has enriched them at the cost of our capital and labour?

Have we not, in numberless cases, been careless in the exercise of the elective franchise, either not voting at all, or supporting candidates who have neither ability or willingness to advocate our cause? Have not questions vitally connected with our interests been discussed and settled in parliament to our disadvantage? Had we sent right men to the House of Commons, would the *Currency* have been tampered with—the *Malt Duties* retained—the *Tithe* question unsettled—and *Poor Laws* withheld from Ireland? Would *County Rates* and *Parochial* burdens have pressed so unequally, and the real benefit of the country been sacrificed in a cruel neglect of the agriculturists?

The Reform Bill has given us a mighty power, if we choose to employ it for our protection. FARMERS! let us no longer be trodden down like clods under the feet of our oxen. Let us *think* for ourselves and *act* for ourselves. Let every one of us take care for himself to be correctly REGISTERED. Let us seek out and support, with all our interest, "good men and true," to represent us in parliament. Let us *pledge* them to their duty: particularly to the obtaining of ample protecting fixed duties, to be paid immediately grain is imported, substituted for the present graduated scale and postponed payment of duty. Let us send a petition from every county, and from every town, village, and hamlet, in the kingdom, till the tables of parliament GROAN under the burden of our distresses. Let us, at the last hour, save ourselves and our families from the ruin that has overwhelmed so many of our friends, by "a long pull, a strong pull, and a pull altogether."

Yours, &c.,

Swindon, July 8th, 1835.

AGRICOLA.

Mr. Haig of Seggie, near St. Andrews, in the course of two years, and on a moderate extent of surface, put in no fewer than 220,000 drain tiles into the ground. This made a drain of the enormous length of 47 miles. Mr. Langlands of Balkemback, near Dundee, put in 36 miles of stone drains in the course of ten years.

## NORFOLK AGRICULTURAL MEETING AND CATTLE SHOW.

The second annual meeting of the West Norfolk Agricultural Association, took place on Wednesday, July 8, at Swaffham, and was attended by very many of the gentry and most eminent agriculturists in that division of the county, amongst whom were T. W. Coke, Esq., President, Sir W. B. Folkes, Bart., M.P., Sir Roger Martin, Bart., Hon. G. J. Milnes, Anthony Hamond, Esq., W. L. W. Chute, Esq., Henry Blyth, Esq., T. R. Buckworth, Esq., Wyrley Birch, Esq., Captain Fitzroy, Henry Partridge, Esq., H. B. Caldwell, Esq., F. W. Keppel, Esq., Messrs. Edward Farrer, E. Seppings, Henry and Charles Overman, Garwood, Lexham; Margetson, Weasenham; Wright, Rougham; Hastings, Longham; G. Sayer, sen. and jun., Sculthorpe; Burgess, Docking; Hartt, Ashill; Boughen, Westacre; Hudson, Castleacre; Norman, Snoring; Robert Boughen, Pickenham; Abbott, Castleacre; Winearls, Marham; Negus, Crimplesham; Long, Marlingford; Milnes, Fordham; Paul, Pentney, &c.

The show of sheep and cattle was very superior and large, but for want of space, we must content ourselves with merely enumerating the most important among them.

### EXTRA STOCK.

Down ram, belonging to T. W. Coke, Esq., with two three-shear rams, were highly commended by the judges.

Three down rams, shown by Mr. Ellman, were also particularly recommended to public notice.

The constitution of Mr. Overman's rams cannot be too highly recommended,

Mr. Beck shewed three down wethers, which were much admired.

Mr. C. D. Leeder and Mr. J. Sharman shewed some very useful long-wool lambs.

Mr. Money Raven's pen of down shearlings were admired for their character.

Three Cotswold sheep from Lord Sherborne, purchased by Mr. Sayer, were much approved of.

Sixteen ewes and six wethers, (Leicester) the property of Mr. Milnes, of Fordham, were considered as good as any of the breed the judges had seen in the county.

A ram, belonging to Anthony Hamond, Esq., was greatly admired.

A pen of rams, exhibited by Mr. Brown, of Denver, shewed great inclination to fat.

Two heifers, belonging to Mr. Clark, of Swaffham, were highly commended, with many others, as extraordinary specimens of the Norfolk home-bred.

Besides the above, a great quantity of stock was shown, highly deserving notice, in competition for the prizes. They were shown in a small paddock at the back of the Crown Inn, and although 1s was paid by all but subscribers for admittance, several hundred persons were upon the ground. Judges of the sheep and cattle: Mr. John Sayer, sen., Mr. Burgess, of Docking, and Mr. John Hastings, of Longham. Judges of the cattle: Mr. J. Margetson, Weasenham; Mr. Edward Seppings, and Mr. W. Wright, Rougham.

About three o'clock a party of 110 sat down to dinner at the Crown Inn, T. W. Coke, Esq., in the chair, supported on the right by Sir Wm. Folkes, Bart., M.P., and on the left by Sir Roger Martin, Bart., F. W. Keppel, Esq., Vice-President. W. L. W. Chute, Esq., presided at the committee table; Vice, Mr. Edward Farrer. After dinner the secretary, Mr. Milne, read the premiums awarded, as follows:—

### SHEEP.

The best down ram of any age, a sweepstakes of 10s each, one subscriber, with 2l given by the society, and the best hogget ram, three subscribers, ditto—Mr. Henry Overman.

The best shearing ram, two subscribers, with 2l given by the society—General Fitzroy, of Kempstone.

The best long-wool ram, one subscriber, ditto, Mr. Milne.

The best pen of five down ewe hoggetts, four subscribers, ditto, Mr. James Kendle.

The best pen of five down wether hoggetts, two subscribers, ditto, Henry Blyth, Esq., of Sussex Farm.

### CATTLE.

The best bull, of any age or breed, *bonâ fide* in the possession of a member, and being his property six months previous to the exhibition, a sweepstakes of 10s each one subscriber, and 4l from the society, Mr. George Watson, of Wellingham.

The best two-year-old heifer, ditto, and 2l five subscribers, Mr. Moore, of Warham.

The best milch cow, in profit, three subscribers, ditto, Mr. John Hudson, of Castleacre.

The best cart stallion, a sweepstakes of 10s each, and 5l from the society, one subscriber, Mr. West, Breccles Hall. The horse taking this premium, to be used in the county the ensuing season.

The best cart mare, *bonâ fide* the property of a member, a sweepstakes of 10s each, and 2l from the society, three subscribers, Mr. Winearls.

The best stallion, for the improvement of the breed of nag horses, a sweepstakes of 20s, and 5l from the society, five subscribers, Mr. Kendle.

The best boar of any age, a sweepstakes of 10s, and 2l from the society, Mr. Beck.

A premium of 3l was offered for the best newly-invented implement for the purpose of agriculture, but none was shown.

The funds of the association are so much increased, that it is determined to offer many other premiums another year. The increase of subscribers is highly gratifying to the friends of the institution.

DR. JOHNSON AND THE CORN LAWS.—When the Corn Laws were in agitation in Ireland, by which that country has been enabled not only to feed itself, but to export corn to a large amount, Sir Thomas Robinson observed that those laws might be prejudicial to the corn trade of England. "Sir Thomas (said the Dr.), you talk the language of a savage: what, Sir, would you prevent any people from feeding themselves, if by any honest means they can do it?"

NEW METHOD OF BLANCHING CELERY.—In the March number of the *Irish Farmer's and Gardener's Magazine*, a Mr. Cogan recommends the following method of cultivating celery, by which he states he has been successful for many years in preserving this favourite vegetable from what is called "rust," occasioned by the attack of grubs. In the month of October he plants the ground designed for celery the ensuing year with early York cabbage, which will be cleared away by the first week in June, the most proper season for planting. Previous to forming the drills, he collects the stalks and remaining leaves of the cabbages, and places them in small heaps on the bed, which, after lying a day or two, will be found to have collected a great number of slugs and other vermin, which may be easily destroyed. The ground is then easily prepared and the plants put in; when ready for blanching,

the loose leaves of each plant are tied up, and strong wheat straw laid full length along the side of the drills, and staked down so much that it will completely exclude the light (excepting at the top, which is all that is requisite.)

### SHEEP.

The following table exhibits a view of the principal breeds of Sheep in Great Britain:—

1. Teeswater, long wool, no horns.
2. Lincoln, long wool, no horns.
3. Dishley, or New Leicester, long wool, fine, no horns.
4. Cotswold, long wool, fine, no horns.
5. Romney Marsh, long wool, fine, no horns.
6. Dartmoor, or Bampton, long wool, fine, no horns.
7. Exmoor, long wool, coarse horned.
8. Blackfaced, or Heath, long wool, coarse, horned.
9. Hereford, Ryeland, short wool, fine, no horns.
10. Morf, Shropshire, short wool, fine, horned.
11. Dorset, short wool, fine, horned.
12. Wilts, short wool, middling, horned.
13. Berks, long wool, no horns.
14. South Down, short wool, no horns.
15. Norfolk, short wool, horned.
16. Herdwick, short wool, horned.
17. Cheviot, short wool, no horns.
18. Dunfaced, short wool, no horns.
19. Shetland, fine Cottony wool, no horns.
20. Spanish, short wool, superfine, rams horned.
21. Spanish Cross, short wool, fine.

According to Mr. Luccock's Treatise on English Wool, he estimates the number of long-woolled sheep in England and Wales in 1800, to be . . . 4,153,508  
Of short-woolled Sheep . . . . . 14,854,299

|                                                       |            |
|-------------------------------------------------------|------------|
| Total number shorn . . . . .                          | 19,007,607 |
| Slaughter of short-woolled sheep, per annum . . . . . | 4,221,748  |
| Carriion of ditto . . . . .                           | 211,087    |
| Slaughter of long-woolled sheep . . . . .             | 1,180,413  |
| Carriion of ditto . . . . .                           | 59,020     |
| Slaughter of Lambs . . . . .                          | 1,400,560  |
| Carriion of ditto . . . . .                           | 70,028     |

Total number of sheep and lambs . . 26,148,463

In the General Report of Scotland (vol. 3. appx. p. 6) the number of sheep is estimated at 2,850,000 and allowing for the increase that has taken place since 1814, we may, perhaps, estimate the total number of sheep in that part of the empire at this time at 3,500,000.

According to Mr. Wakefield there is not a single flock of breeding sheep in the whole province of Ulster. And though there be considerable flocks in Roscommon and other counties, it is believed, that if the whole number of sheep in Ireland be estimated at 2,000,000, it will be a good deal beyond the truth.

On the whole, therefore, if these estimates be right, the total number of sheep in Great Britain and Ireland may be taken at about 32,000,000.

THE ESSEX PRIZE WOOL CUP.—COLCHESTER, July 3.—The certificates having been sent into Mr. Gilson, the secretary, the silver cup value five guineas, has been awarded to Messrs. Johns, of Chelmsford, whose purchases amounted to 21,652 lbs. The total sum realised by wool, sold on the 16th June is estimated at £3,500. This is an excellent beginning; the result, indeed, will not fail to insure an increase of buyers and sellers on the next occasion.

### AGRICULTURAL DISTRESS—SILVER STANDARD.

MR. CAYLEY'S SPEECH IN THE HOUSE OF COMMONS, ON MONDAY, JUNE 1, 1835.

Mr. CAYLEY.—Before I proceed to direct the attention of the house to the subject of the motion with which I shall conclude, I will take the liberty of shortly stating the reasons which have induced me to persist in bringing it forward, against a prevailing wish in the house that the subject of corporate reform should have precedence. Sir, I know I stand on unpopular grounds with many members on account of what they may term my obstinate determination in this respect; and I feel I owe, and am ready to make, an apology to the house, for thus interfering between it and so important a measure as that of municipal reform. If I were actuated by any private or personal considerations, I should be ashamed to find myself standing where I am at such a juncture; but feeling that I am guided on this occasion by a sense of public duty, and by that alone, I confess I feel relieved in a great measure of the responsibility. It is not that I underrate the importance of corporate reform; but that such is the fallen state of British agriculture, that I can conceive no question of such pressing importance. I appeal to every member around me who knows the condition of the farmer—not by hearsay, merely, but who has seen his distress, as it were, bodily before his eyes—whether I am not justified in my resolution. I think, moreover, I ought not to be condemned for an obstinate perseverance in this motion, before the case is fully understood. I gave notice of it on the first day of the session, for the 19th of May; at that time the noble lord the Secretary for the Home Department was not in the house, and at the request of my right hon. friend the Chancellor of the Exchequer, I postponed it—very unwillingly, indeed, as he will testify—on the ground that it would be inconvenient to the ministry to have it brought forward in the noble lord's absence. At the same time, there was a distinct understanding between my right hon. friend and myself, that I should have every facility from the government in bringing the motion forward this day. Besides, this was the second occasion, in the present session, on which I had given way to the government on a question affecting the interests of agriculture.

I may also state that, last session, I gave notice of a motion similar to the present, which I was prevented from bringing forward by the unusual length of the Easter vacation, and subsequently to that I had no opportunity of doing so. I trust the house will be satisfied with this explanation. It must always be a matter of extreme regret to any one, to have to resist what appears to be the wish of the house. The subject of my motion is of a painful nature in itself, and it would be rendered still more painful to me, should I have to force it upon the attention of a reluctant audience. No person, sir, can be more fully aware than myself of the difficulties which attend the execution of the task I have undertaken, or of my own inability to cope with it. I have, however, directed my attention to the subject for some years; and I only wish that my powers of commanding the attention of the house were, in any degree, commensurate with the anxiety I feel to obtain some measure of relief. I trust, however, to its patient indulgence, for I am aware of the tedious nature of a discussion of this kind, since the statements which I shall

feel it my duty to make, must be borne out by reference to documents. Feeling, therefore, that this question admits of no delay—being convinced that things cannot remain as they are without extreme danger—not only to the agricultural interest, but to all other interests connected with it, and from the spirit of discontent and dissatisfaction which is generated by distress, even to the institutions of the country themselves,—I am induced to persevere, in the hope that I shall obtain the attention which is due, not to myself, but to the importance of my subject.

This is no party question, and I trust that it will not be treated in a party spirit, for if the subject of agricultural distress could be discussed, on either side of the house, in a party spirit, the situation and prospects of the agriculturists would be lamentable indeed—even more so than I, unfortunately, have reason to believe them to be. Some of the difficulties, however, with which I otherwise should have had to contend, in bringing this question forward, have been removed by the acknowledgment which three of the highest authorities in this house—namely, the right hon. baronet (the member for Tamworth), the noble lord (the Secretary for the Home Department), and the right hon. Chancellor of the Exchequer, made the other evening, when the noble member for Buckinghamshire brought forward his motion, “that the agricultural interest cannot hope to obtain substantial relief from any additional remission of local and general taxation.” But are not these the very modes of relief to which our attention has been always directed by our rulers? And now, at the eleventh hour, we are deliberately informed we have nothing to expect from these sources, or so little, as to afford no hope of perceptible improvement. Am I not justified, therefore, in inferring that this is an opportune occasion on which to propose another species of relief—a species of relief, too, which has never yet been tried without success; whilst that from remission of taxation has had no visible influence whatever? The right hon. Chancellor of the Exchequer boasted that within the last fifteen or twenty years, which have elapsed since the peace, the agricultural interest has been relieved from 8,000,000*l.* of taxation. I could not but regret the tone in which the right hon. gentleman made that statement, because it seemed to say, “we have done so much for agriculture, we cannot afford to do any more.” Now, what does all this remission of taxation (with agriculture getting worse and worse, in spite of it) prove, but that we have gone the wrong way to work, and that private incumbrances and engagements have pressed on the agriculturist as much, or more, than public ones. The right hon. gentleman also referred, with an air of triumph, to the fact, that the agricultural interest was not so heavily taxed, in comparison with other classes now, as in various reigns to which he alluded. What does this prove? Why, that the agricultural interest was better able to bear a greater amount of taxation at those periods than it is now; so that my right hon. friend has only furnished another lamentable illustration of the agricultural distress.

The Noble Secretary for the Home Department told the house, the other night, that, in 1833, the agricultural committee recommended that the Legislature should not interfere on the subject. This was very far from being an unanimous opinion on the part of the committee, besides the question of the currency was excluded from the

consideration of the committee, which was the only efficient way in which to interfere. The report went on to say that it was a perilous thing to try experiments on the farmer. This is also very true; but having brought him to death's door by one experiment, may not we bring him to life by another? and, at all events, he cannot be in a worse state than he is in now; for I ask whether the agricultural interest is not now in a worse state than it was in 1833? The price of wheat in 1833 was 54*s* a quarter, whilst now in some districts of the country it is not more than 34*s*. I hold in my hand the *Mark Lane Express*, by which it appears that on the 27th of April last the average price of wheat was 38*s* 10*d* per quarter.

Mark Lane, April 27th.

The weekly aggregate average price of wheat throughout the kingdom did not exceed last Thursday, 38*s* 10*d*, which, according to Winchester measure, is equivalent to 37*s* 8*d*, being lower than the average for the last fifty-five years, when in 1779 and 1780, the rates were 33*s* 8*d* and 35*s* 8*d*; and in analyzing the averages of the past week we find, that in Lincolnshire the quantity of wheat returned as sold is 5373 quarters, and the price 36*s* 10*d*; in Northumberland, 3701 quarters, and price 35*s* 5*d*; in Huntingdon, 582 quarters, at 35*s* 5*d*; Oxford, 233 quarters, at 36*s* 1*d*; Northampton, 477, quarters at 36*s* 9*d*; the higher averages being for small quantities in Wales and Cornwall.

In 1833, when wheat was 54*s*, it was 10*s* under the remunerating price, but since then there has been a fall of 20*s* more. This tremendous fall in the price of wheat began at the close of the scarce seasons 1828, 1829, 1830, 1831. It had, indeed, begun in 1827; but those wet years caused a scarcity price, and so concealed the effects of the preparation for and the final extinction of 1*l.* notes in 1829. Many gentlemen, and amongst others, the hon. member for the Tower Hamlets, near me, seem to think that the agricultural interest is not so badly off as is represented, because barley and oats and wool sell well at present. Any person, however, acquainted with agriculture, knows the cause of this, and that it is accidental.

During the two last years dry springs have prevailed, and it is an incontrovertible fact, (which I may state for the benefit of those who are in the habit of passing judgment on agriculture, although unacquainted with rural affairs), that a dry spring is invariably accompanied by the failure of the barley and oat crops. It was in this spirit the right hon. baronet, the member for Tamworth, spoke, when my noble friend (Lord Chandos) brought forward his motion for a repeal of the malt-tax. He argued as if the present was to continue to be the price of barley in any ordinary season; that this being the case, the barley lands did not want relief, and therefore the malt-tax ought not to be repealed. All this was in total ignorance of the fact, that both the last years, and especially the last, was not more in most districts than half a crop of barley, and of oats the same. Of course a rise in price must be the consequence: but to suppose that any advantage accrues to the agricultural interests generally, from scarce seasons, is not only untrue, but a thankless blasphemy: a partial deficiency of crop may be advantageous to such parties as escape it, because they reap, with a full crop, the benefit of a scarcity price. Then the hon. member for the Tower Hamlets goes on, —this inequality in the prices of wheat, barley, and wool, proves that the change of the currency has had nothing to do with the general fall in

prices: the hon. gentleman, it should be known, is one of those who tell us that the Bank of England issue more of their notes when they have to answer them in gold, than they did when they were a legal tender; and of course he must argue, to be consistent, that a larger or smaller quantity of currency makes no difference in prices. But what is the fact as to barley and wool? Before the wet seasons began in 1828, that is to say, in 1826-7, after the 17. notes were withdrawn in 1825, wool fell down to 8d per lb, and barley, also, so low, that it was matter of debate with many practical farmers, whether it was worth occupying a farm which only produced barley and wool. I remember this the better, because I occupy a farm myself of this description. At that time many of the old sheep walks, in consequence of the late introduction of bone-dust as manure, were ploughed up; and those light, poor soils, from being the least profitable, have, from the smaller comparative expense attending their cultivation, become lately the most safe to cultivate.

When the question of agricultural distress was brought forward last year, the noble lord who was then Chancellor of the Exchequer, (Lord Althorp) talked much in the same strain as the member for Tamworth; it is, I suppose, the usual official language; he said, it was true that wheat sold badly, but wool sold well. What was the reason of that? From 1828 to 1831 there was a succession of wet seasons, which created the rot amongst flocks on soils where it had not been known for 50 or 100 years before. It was calculated that one-fourth of the sheep flocks in the kingdom was swept away by this disease. The aggregate number of sheep is estimated at 32,000,000, and therefore a deficiency of 8,000,000 had to be supplied. And as far as my own knowledge and inquiries have gone, I do not think this, by any means, an exaggerated estimate. It was only the uplands that escaped this scourge, in the lowlands entire flocks were carried off. Of course mutton and wool rose to a scarcity price; and beef also, to supply the place of mutton. But wool rose highest, in proportion, because the sources of supply are more limited. England alone can furnish the long wool, whereas the carcase of the sheep could be fetched from the hills of Scotland; but the wool could not be supplied from that quarter. Thus mutton and beef were prevented from rising to the same extent as wool, and the immense importation of Irish pigs (which are always largest under low prices) conducted to the same result. And another reason why wool sustained so high a price was the necessity of our manufacturers preserving their place with woollen goods in the foreign market, at any cost, because the market once lost, would with difficulty be regained. There can be no greater proof of the inordinate scarcity of wool than that, in 1833, the importations of wool exceeded those of preceding years, by 10,000,000lbs, while the export of woollen goods has been stationary. Now no one will pretend to say that this additional 10,000,000lbs has been consumed by the home market, which is in so depressed a state from the adversity of the agricultural interest. On the contrary, it was a general complaint on the part of the witnesses summoned before the agricultural committee of 1833, that the clothes of agricultural labourers, which had formerly been woollen, had now become changed to cotton, an alteration arising out of necessity (cotton being cheaper) and much to be deplored; because in a variable climate like this, and especially in winter out-of-door employment, woollen was much more suitable, and much pre-

ferred. Are we, then, to be surprised at the extraordinary rise in the price of wool—when we know the cause—a rise from 8s or 10s a stone in 1827-8, before the rot commenced, to 24s and 30s in 1833-4? But we may rely upon it, that in proportion as the scarcity is filled up, the price will fall; it had already fallen at Christmas last 30 per cent; and the deficiency would much sooner have been made up, if it had not been that the capital of the farmers had been so exhausted before the loss of their sheep, that they had scarcely anything left to purchase new flocks with. To be sure they had the power of taking in the flocks of those capitalists who chose to speculate in sheep: and this has been done to a considerable extent. Then the fall in the price of meat also is very marked since last year. Stock has not paid for keeping the last winter. I hold in my hands a letter from a very intelligent farmer in my own district (near the wolds of Yorkshire), which is notorious for barley growing, stating the comparative prices of a great number of agricultural articles in February 1834, and February 1835. He gives the returns of two markets, Leeds, a manufacturing, and Malton, a purely agricultural one:—

| LEEDS, February 18th, 1834.  |   |    |                      |                 |   | February 17th, 1835.       |        |   |                      |    |                 |   |   |
|------------------------------|---|----|----------------------|-----------------|---|----------------------------|--------|---|----------------------|----|-----------------|---|---|
| Average price per quarter.   |   |    | Per stone of 14 lbs. |                 |   | Average price per quarter. |        |   | Per stone. of 14lbs. |    |                 |   |   |
| £                            | s | d  | £                    | s               | d | £                          | s      | d | £                    | s  | d               |   |   |
| Wheat                        | 2 | 8  | 3½                   | Beef            | 6 | 3                          | Wheat  | 2 | 0                    | 10 | Beef            | 5 | 9 |
| Barley                       | 1 | 9  | 5½                   | Mutton          | 8 | 9                          | Barley | 1 | 14                   | 2½ | Mutton          | 6 | 5 |
| Oats                         | 0 | 17 | 10½                  | Pork            | 5 | 6                          | Oats   | 1 | 2                    | 7½ | Pork            | 5 | 0 |
| Beans                        | 1 | 13 | 7½                   | Pig for salting | 5 | 0                          | Beans  | 1 | 16                   | 7½ | Pig for salting | 4 | 9 |
| MALTON, February 15th, 1834. |   |    |                      |                 |   | February 14th, 1835.       |        |   |                      |    |                 |   |   |
| Average price per quarter.   |   |    | Per stone.           |                 |   | Average price per quarter. |        |   | Per stone.           |    |                 |   |   |
| £                            | s | d  | £                    | s               | d | £                          | s      | d | £                    | s  | d               |   |   |
| Wheat                        | 2 | 1  | 3½                   | Beef            | 6 | 0                          | Wheat  | 1 | 15                   | 8½ | Beef            | 5 | 6 |
| Barley                       | 1 | 3  | 8½                   | Mutton          | 8 | 2                          | Barley | 1 | 9                    | 10 | Mutton          | 6 | 5 |
| Oats                         | 0 | 16 | 1½                   | Pork            | 5 | 0                          | Oats   | 1 | 0                    | 1½ | Pork            | 4 | 6 |
| Beans                        | 1 | 10 | 6                    | Pig for salting | 4 | 3                          | Beans  | 1 | 13                   | 2½ | Pig for salting | 3 | 9 |

He goes on to say,

You will perceive that wheat has again fallen in price this year more than the full amount of rent now paid, notwithstanding the reductions which have taken place the last ten or twelve years. The price of barley, oats, and beans may appear to the philosophers to contradict this; but from inquiry of many farmers in this district, and men occupying different soils, I find that the average of barley will not be two quarters per acre, oats four quarters, beans two quarters—produce of last year (1833) on an average—barley nearly four quarters, oats six quarters, and beans two quarters. Bean crops in 1831 and 1832 averaged four quarters at least. If you calculate the value this year, by the quantity of barley and oats per acre, you will find though prices are higher than last year, there is a serious loss to the growers from the falling off in quantity.

Such is the condition of the landed interest of this country at this moment. And I ask, and I ask boldly, is this state of things to continue. Land cannot be cultivated at the present prices; let Parliament declare once for all whether it will encourage a system which has brought this distress upon us. It is for Parliament to say how much land is to be thrown out of, or to remain in, cultivation. Let it go to work in a business-like manner; let it address his Majesty to send out a Commission to inquire, and to report, after minute investigation, how many acres of arable soil there are in Great Britain, that will pay a profit at 5s per bushel for wheat. My firm conviction is that the report, if faithfully made, would state that nineteen acres out of twenty, would not pay

a profit at such a price; and I am as confident that it would report that one-third or fourth of the arable soils could not pay a profit under 7s or 8s a bushel for wheat. If we had a report of this kind, we should know on what ground we stood; we should then see what sort of ministers those were, who, with these facts before them, dare perpetuate a system, that will lay waste the greater part of the cultivated soils of the kingdom. No, Sir, it could not be; I am convinced it is ignorance alone of the real state of the farming interests which causes such an apathy on the part of our rulers, with respect to proposals for relief. This ignorance is confirmed by a mistaken notion on the part of some members whose estates are in a great measure confined to the upland districts, that the results of the wet seasons, which have been so favourable to them for three or four years, are likely to continue. They probably come to the Minister and tell him that all this history of extreme distress, is exaggerated, that they know from their own experience that rents are very fairly paid, and so on. This is all very agreeable to the Minister to hear, for he is afraid of giving offence to other interests, and especially to the monied interest, by appearing to take too great an interest in the rise of agricultural produce. But what can be more shortsighted and contemptible than such a view, which not only betrays an ignorance of the cause of the uplands having a temporary, and that a very temporary, advantage; but also a cold-blooded indifference to the sufferings of those, from whose sufferings alone, those upland soils have been preserved from destruction.

Again, there are some who imagine all must be prosperous because they are. I know an instance of a gentleman who always wonders at hearing any complaints of distress:—"His rents are well paid, and he is as rich a man as ever;" and he appeals to his agent in testimony of the truth of this statement. On inquiry, I found that great parts of this estate had been actually brought into cultivation by means of bone dust, about ten years ago; that a large lime-quarry, which served almost the whole neighbourhood, had lately been opened on his estate; and that a rail-road had sprung up close to him: while the steward, notwithstanding the fall in prices, had never had his salary reduced. Here was cause enough for prosperity: had it not been for these adventitious circumstances, what would have been the condition of that estate? What could have prevented that gentleman and his tenants sharing the fate of their neighbours? I repeat, Sir, that if wheat is to remain at 36s or 38s a quarter, and there is no hope of a rise except from some action on the monetary system, at least half the arable land in the country will be unable to bear any rent at all. I mean arable land disconnected from pasture land, the latter of which has lately had advantages from the rise in wool and stock. We are come to a pretty pass indeed, if an acre under the plough cannot pay its own expenses. Arable land ought to pay a profit, *per se*, independent of all connection with grass; but I ask whether, during the last four years, three-fourths of the arable land could have paid rent, if the whole had been farmed without the intermixture of grass land? Every one knows, who knows anything of farming, that for those years the profits on wool and stock have only covered the loss on the plough. I would here call the attention of the house to some calculations as to the profits of farming, drawn up by a more practical agriculturist than myself (although I am one),—I

mean Lord Western. I see that the right honourable Chancellor of the Exchequer smiles, because, I suppose, he thinks that Lord Western entertains an opinion similar to mine upon a particular point,—the evils arising out of the change in the currency. The right honourable gentleman may smile; I can only say, that if Lord (then Mr.) Western's views on that subject had been acted upon, and his motion granted in 1822, thousands of broken hearts would have been spared, which have descended from comfort and competence to the workhouse and gaol, and have there quitted the scene.

My noble and right honourable friends now occupy the Treasury benches, and I rejoice that they do; but I never held an opinion more strongly in my life than that they would not have occupied those places but for the misery, destitution, and discontent arising out of the change of the monetary system in 1819. It was this which was the fruitful source of dissatisfaction with all established things, and it was natural that such should be the consequence: for what value can the productive classes have for any government, or system of government, which does not protect their property and promote their comfort? I do not mean to infer that reforms were unnecessary. I have been pretty constant in my support of most of the measures of reform introduced by his Majesty's government; but I cannot conceal from myself that the popular excitement in favour of these reforms has sprung from uncomform and distress; and although I may rejoice in this result, I cannot but deeply lament the cause; especially since, if it continue, the best of our institutions may be as insecure as those which have no foundation to stand on. In my opinion, therefore, he who was the most able opponent of the Reform Bill, being the author of the Act of 1819, was himself the foremost cause of the success of that bill. The following is Lord Western's calculation:—

I suppose a farm of one hundred acres, of fair, good, arable land, well cultivated upon the four course system, the produce of wheat, at  $3\frac{1}{2}$  qrs. per acre, barley, 5 qrs., beans and peas,  $3\frac{1}{2}$  qrs. Wheat, during near a quarter of a century (from 1797 to 1819) had averaged 80s the quarter; fifteen years preceding 1819, 85s; the rent founded upon these data I take at 35s per acre; the moment the Bill passed the markets fell 30 or 40 per cent., and in the fifteen years succeeding, the average price has been, as near as may be, 55s; it has subsequently fallen still lower, and is, I believe, now only 40s. I therefore consider the price of wheat to have fallen, on the average, 30s per qr.; barley, 20s; beans and peas, 20s. Upon these grounds I estimate the reduction of the money receipts of the farmer upon 100 acres to amount annually to 325*l*. The reduction of price upon clover, tares, and turnips, is loosely estimated, but moderate. I take no notice of the change of price of various minor articles, the produce of such a farm. This aggregate and enormous difference in his return, I think I clearly establish, upon the following calculation; I take the produce on the four course system to be as under:—

|                   | Acres.           | Qrs.           | Diminution.          | £ s.    |
|-------------------|------------------|----------------|----------------------|---------|
| Wheat             | 25               | $3\frac{1}{2}$ | per acre—30s per qr. | 131 15  |
| Barley            | 25               | 5              | ditto —20s ditto     | 125 0   |
| Beans and Peas    | 12 $\frac{1}{2}$ | $3\frac{1}{2}$ | ditto —20s ditto     | 42 0    |
| Clover            | 12 $\frac{1}{2}$ | —              | —                    | 15 0    |
| Turnips and Tares | 12 $\frac{1}{2}$ | —              | —                    | 12 0    |
| And fallow        | 12 $\frac{1}{2}$ | —              | —                    | —       |
|                   | Acres 100.       | —              |                      | £325 15 |

If the landlord reduces 15s per acre, or, in other

words, reduces his rent from 175*l* to 100*l*, the tenant has 75*l* to set against 325*l*; if the landlord sinks his rent 20s the acre, and, instead of a rent of 175*l*, puts up with a rent of 75*l*, the tenant has 100*l* to set against 325*l*. I will not stop to comment upon the situation of the landlord under such circumstances—it must be too obvious to need any observations. I will go on to suppose the entire rent done away: the tenant will still be under the necessity, singular as it must appear, to reduce his expenditure in other ways to the extent of 150*l* to make up, with the rent of 175*l*, the loss of 325*l*, to put himself upon the footing on which he stood prior to the year 1819. I cannot discern where he can look to for means at all adequate to effect this reduction, even if I give him the malt-tax wholly repealed into the bargain.

Now, this calculation is in reference to land of a superior quality; bearing 3½ quarters of wheat per acre; (the average of the kingdom being certainly not more than 2½ quarters), and 5 quarters of barley, which is 1½ quarters more than the average crop. If such are to be the consequences, from the fall in prices, to soils of this superior description, what is to become of others inferior in quality to this? And not less than two-thirds of the whole are inferior. What is to become of the labourers—what of the tenantry? I cannot conceive how the Legislature can allow such a state of things as this to continue. Nothing can be more alarming in this respect, than a statement which I heard the other day, unparalleled, I believe, in the history of agriculture. I do not see the hon. member for Inverness in his place, otherwise, I am sure, he would bear me out in this statement, that in Scotland they are at this moment adulterating oatmeal with wheat flour. The straw on an acre of land, I am informed, has actually sold lately in London for a higher price than the wheat itself. The landlords, sir, have their necessities as well as others. I believe, if the rent paid for the last five years had been graduated according to the amount of profit arising from the produce, they would scarcely have received any rent at all for their land. I have even heard of cases this year, where the whole half-year's rent has been foregone; and other cases where the landlord has been compelled to cut down young trees of under fifty feet of wood, in order to make up some compensation for the loss of his rent.

Sir, the agricultural interests will be in a much worse condition, when the prices of wool and stock find their level. Before that visitation of providence, of which I have spoken, took place among the sheep, in 1828, and the following years, wool was down at 8s and 10s a stone, and mutton down at 3½d and 4d per pound. When these prices again arrive, which they will, as surely as winter follows summer—when the present scarcity is supplied—then, and not till then, will the full measure of the agricultural depression be perceived. Blind and infatuated are those who rest supine, awaiting this tremendous crisis, and who seem resolved not to lend an effort to avert the impending storm. When it is too late to rescue thousands of innocent men, who have been ruined by no act of their own, but by a deliberate act of the legislature, they will begin, perhaps, to repent of their selfish indifference. But my noble friend, the Secretary for the Home Department, gives us this consoling advice: he told the noble marquis (Chandos), the other night, that the only way to relieve the farmer is to reduce his rent. Before the agricultural committee of 1833 it was shown

that rents had been reduced, on an average, about 25 per cent. since the war, and that if wheat remained so low as 54s per quarter, another reduction of 25 per cent. must be submitted to. But now we are reduced to 35s per quarter for wheat, and the whole rent on half the soils in the kingdom, must be swept away altogether, if this price is allowed by the legislature to continue. I ask, why is the landlord to be called upon to sacrifice his rent, which is as fairly due to him, (being the interest on the capital he has invested in the land), as the interest of any other capital is to any other capitalists? Why is not this species of public property to be protected, as well as any other? The landlord made his investment in the land upon the calculation of realizing 3 per cent. for his money; and he consented to receive that low rate of interest on the principle, and on the pledge that land was absolute security;—and is he not to get 1 per cent. on it? or is he to be called upon to forego the whole? What plea has the fundholder more than he? The fundholder bought into the funds, speculating on a higher profit; he expected he had a great risk to run, but he was willing to run the risk for the immediate advantage of a higher rate of interest; he got 5 per cent., when the landlord was willing to receive 3:—the landholder bought his land, calculating on a less per centage, on the principle that he was to have the least possible risk to run. He was to have less immediate gain, but that gain was to be absolutely secured, and to be permanent; the fundholder was paid to run the risk; he received the price in exchange for less security, and now he receives all the price, and all the security likewise;—while the landlord who paid him to encounter this danger, has had all the danger to incur himself, and has lost his property in the bargain to that very party he had paid money too to protect it. We are coolly told we must come down to the level of 1792—the times before the war. Would to God we were allowed so to do! 1792, with its higher prices, and lower taxes! What was the situation of the landlord in 1792? I have now before me an abstract from the books of an experienced agriculturist, on which reliance may be placed, which has been continuously kept by his father and himself since 1792, on a farm of 600 acres. The following are the results:—

|                                   | 1813<br>Higher than<br>1834<br>Per Cent. | 1834<br>Higher than<br>1790<br>Per Cent. |

The prices of agricultural produce in 1813, were, on the average, 100 per cent. higher than 1834, (taking into the account an unnatural price in wool, stock, barley, oats, and hay from the rot three or four years ago, and the last two dry springs). Yet, with a diminished price in his produce of 100 per cent., the British agriculturist has experienced a fall of only 35 per cent. on the wages he has to pay! 34 per cent. in his household expenses; while he has to pay an increase of 49 per cent. local taxation, with 100 per cent. less price of produce.

Again, taking the same temporary causes into account for a rise in certain articles at the present time (as in the previous case,) and no one practically acquainted with agriculture will deny that such exception must be made to come to a fair conclusion; the prices of agricultural produce in 1790, testing them by wheat, were as 49 to 42, or 15 per cent. higher than 1834; yet the agriculturist in 1834 although receiving 15 per cent. less for his produce has to pay for his

|                         |     |             |
|-------------------------|-----|-------------|
| Labour.....             | 62  | } Per Cent. |
| Household expenses..... | 57  |             |
| Local taxes.....        | 391 |             |

more than the agriculturist of 1790.

Now, Sir, it appears that the rent of these 600 acres of land at each of these periods, if levied really according to the rate of prices and expenses of cultivation, would be:—

|        | 1790 | 1813  | 1834 |
|--------|------|-------|------|
| Rent.. | £851 | £1227 | £353 |

And this upon a farm more than commonly productive, and where the proportion of grass is unusually large; namely, nearly one half: thus reaping the benefit of an adventitious rise in the price of wool, at least 300 per cent. higher than it was four or five years ago, before the rot in the sheep flocks commenced. But for this circumstance of wool, sheep, and stock selling so high in consequence of scarcity, it is plain that the farm would, in latter years, have been worth scarcely, if any rent at all. Under these circumstances, is the landlord tamely to submit, not merely to the entire loss of his property, but to have the taunt thrown out on so many occasions that he is grasping at a monopoly and calling for higher prices, regardless of the general interests of the country? Instead of thus tamely submitting to be led like sheep to the slaughter, my advice to the landlords is to resist to the uttermost this barefaced and unjustifiable attack upon their properties; this handing over of their estates into the possession of Jews and stock-jobbers.

The state of distress, Sir, which I have feebly endeavoured to pourtray, has existed with very slight intervals ever since the peace; there have been, indeed, occasional gleams of prosperity since that period; however, they were but of short continuance. The best estimate perhaps of the long continuance of this dreadful pressure may be formed from the speeches which have been deli-

vered from the throne on the opening of the sessions of parliament which have intervened. In 1815, distress was stated generally; and the Prince Regent's speech, on the 28th of January, 1817, states,—

The distresses consequent upon the termination of a war of such universal extent and duration, have been felt with greater or less severity throughout all the nations of Europe, and have been considerably aggravated by the unfavourable state of the season.

From the end of 1817 to the beginning of 1819, however, there was a recurrence of prosperity; then from 1819 to 1822 a recurrence of adversity; and again from 1823 to 1825 a recurrence of prosperity; and lastly, from 1825 to the present time, another recurrence of adversity: these changes and alterations, therefore, could not have sprung from the mere transition from war to peace, because, at various periods subsequent to the termination of the war, prosperity had arisen; showing that prosperity could exist in time of peace.

There have been many causes assigned at different times for the prevalent agricultural distress; sometimes it has been over-production. The Prince Regent says, in 1817, it was under-production: first comes over-production, then under-production, then over-population,—as if over-population and over-production were not the two things exactly adapted to each other; and, besides these delusive theories, we are told it is in consequence of a great supply of corn from Ireland. This is not the first time in our history, when distress arising from a scarcity of money, has been attributed to the importation of Irish produce; to this, perhaps, I shall allude hereafter: but such reasons are vain and mischievous, and I verily believe they are only fostered and encouraged by designing men, who make a profit of our distress, and whose interest it is to deceive the suffering agriculturists into hopes that never can be realized.

As a corollary upon the speech of 1817, there was a deficiency in the revenue—considerable excitement and disturbance throughout the country—the Prince Regent was personally attacked—and petitions for relief from taxation and for reform were numerous. Sir, notwithstanding the smile of the right hon. gentleman, the Chancellor of the Exchequer, when I mentioned, a short time ago, that distress was the parent of reform, there does thus appear to be a close connexion and sympathy between the distress of the people and their desire for reform; and what I had conceived as a probable result, is thus confirmed by history.

In February, 1818, the speech announces a revival of trade and a removal of distress. It is well known that, upon the suggestion of the government, in 1817, the Bank of England put 3,000,000l or 4,000,000l more of its paper into circulation; and consequent upon that were the higher prices of agricultural produce, and the removal of distress. I know it will be advanced by some that the rise in corn in 1817-18 was from deficient harvests; I am aware that 1816 was a deficient harvest: but we never have prosperity among all classes in a time of famine: whereas, in these years, the speech from the throne lays particular stress on the well-doing of trade; besides, all other prices as well as corn rose in 1817-18, which shows that other causes were at work. We find it stated again, in January, 1819, that "trade, commerce, and manufactures were in a most flourishing condition;" but mark the contrast in a few short months. On November the 14th the house was called together on account of seditious

practices in the manufacturing districts, and a spirit manifested for the "subversion of the rights of property, and of all order in society." This was at the end of the year after Mr. Peel's bill had passed, although by the Prince Regent's speech, in January of the same year, it appeared that "trade, commerce, and manufactures had been in a flourishing condition." Here we see the consequence of restricting the circulating medium, by which both the manufacturing and commercial interests were thrown into a state of depression. Here we have, again, corroborated the principle that distress and discontent travel hand-in-hand.

In 1821, the speech from the throne declares "distress to be still pressing upon a large portion of the country; "the foreign trade also in a state of depression." Gentlemen who remember the low prices of 1821, and who are clamorous for a lower price of corn for the benefit of the foreign trade, should also bear in mind the effects of low prices upon the foreign trade in 1821. On the 5th of February, 1822, the speech states that the revenue was increased, the more important branches of commerce and manufactures in a flourishing condition; and the King proceeds to say, "I must, at the same time, deeply regret the depressed state of the agricultural interests." On the 4th of February, 1823, the King declares the "continued depression of the agricultural interests," and the "flourishing condition of commerce;" and "there is a surplus revenue."

On the 3rd of February, 1824, the tone of the King's speech was entirely changed. I had not the honour of a seat in this house at that time, but I doubt not there are some hon. members present who remember the "prosperity speeches" of his Majesty's then Chancellor of the Exchequer. His Majesty also states the "prosperous condition of the country, (wheat, remember had risen 20s a quarter);—trade and commerce were extending themselves at home and abroad;—and increasing activity pervading every branch of manufacture;—increasing revenue;—agriculture recovering from the depression under which it laboured;—and a cheerful spirit of order pervading all classes of the community." Here is another illustration of the fact,—that when the people are comfortable and prosperous, they do not trouble themselves much about reform. The prosperity of 1824, it is well known, proceeded from Lord Londonderry's One-Pound Note Act, and the pushing out of 3,000,000. or 4,000,000. of paper by the Bank of England; Lord Londonderry publicly declaring that he promoted these measures with a view of restoring prosperity.

The speech on the 3rd of February 1825, declares "A continued improvement in the state of the agricultural interest, the solid foundation of our natural prosperity" (a doctrine which, I am afraid, has been lost sight of during the last few years). "All the great interests of the nation in a thriving condition; and a feeling of content and satisfaction widely diffused throughout all classes of the British people"—"Ireland participating in the general prosperity." Ireland, too! It seems in these times they had discovered the secret of assuaging the discontent of that country also.

The speech from the throne, on the 2nd of February 1826, deplores the late pecuniary crisis; and proceeds—"Some of the causes to which this evil must be attributed, lie without the reach of parliamentary interposition; nor can security against the recurrence of them be found, unless in the experience of the sufferings which they have oc-

casioned." This is the sort of general mode in which we have always dealt with money and banking concerns; we slur them over, or lay the blame at the wrong door, and refuse all inquiry into the cause of any mischiefs arising from their operation. I may probably hereafter have occasion to speak of the causes of this panic, and shall be enabled to show, that it might have been prevented by parliamentary interposition, and that it arose not out of a larger quantity of paper circulating, but because parliament had neglected to provide a sufficient basis on which it could rest.

On the 21st of November, 1826, parliament again met. In the speech, depression and suffering in trade and manufactures are regretted—abating but slowly; and certain sorts of foreign grain, not then admissible by law, were admitted in September, under (I think) orders in council. An amendment was moved to the address, and rejected by 170 to 24,—"That the cause of the existing distress is 'an excessive taxation, disproportionate to the reduced value of property, and to the diminished return for the capital employed in the land, in manufactures, and in commerce.' " Parliament appears to have begun at last to think that the transition from war to peace had not been the cause of all the distress.

The speech on the 29th of January 1828, states, that "A considerable increase in the export of the principal articles of British manufacture had taken place, indicating the continued abatement of commercial difficulties." That was the time when the Duke of Wellington was at the head of affairs, and Lord Althorp sat on this side of the house. I remember his speech upon that occasion; he stated, that though the distress appeared to have met with some abatement, he feared it was only temporary. Now I do not mean to insinuate that a seat on the other side had any effect on the noble lord; but still, when he was sitting on the treasury benches, only a short time afterwards, his opinions seemed to change with respect to the character of the distress,—showing, that gentlemen in office either have not time to investigate into distress, or that they have one test to measure it by in office, and another out of office. Lord Stanley also declared, in 1828, that he believed the improvement to be superficial—the distress deep and lasting.

In February 1829, the speech speaks merely of the "improvement of the revenue." On the 4th of February 1830, it is declared—"That the exports, in the seven last years, of British produce and manufactures, exceeded those of any former year; his Majesty regrets that, notwithstanding this indication of active commerce, distress should prevail among the agricultural and manufacturing classes." The cause assigned is—"unfavourable seasons, and other causes, beyond the reach of legislative control." An increased export, therefore, seems to form no criterion of the prosperity, in this case, even of the manufacturing interest, but certainly not of the agricultural interests; for, in the year 1822, when the petitions of the agriculturists were so numerous for relief, Mr. Huskisson stated, that, notwithstanding these petitions, the exports for the last three years were increased. In 1830, also, when his Majesty deplored the continuance of agricultural distress, Mr. Huskisson made a speech to the same effect, namely,—that the exports for the last three years had considerably increased. To this day, it is the fashion with a certain party to boast of increased exports, to console the farmers for their distress; and I may remind my right hon. friend the President of

the Board of Trade, that his speeches, on other occasions, have been quite consistent with those of Mr. Huskisson; for, in 1833, when the agricultural interests complained that distress had been going on so long among them, he quoted long tables of the increase of exports, to show how flourishing they ought to be. Poor comfort! I trust we shall hear no more of the exports being a test whereby to measure the degree of agricultural distress or prosperity. On three separate occasions it has failed of success; which shows, however great the identity of interest may be (and I believe it to be entire) between the agricultural interest and the manufacturers for the home market, that the export trade is in a great measure independent of this connexion, and may exist distinct and apart from it.

Parliament met again November 1830. The speech remarks upon the "spirit of discontent and dissatisfaction among the people—breaking of machinery," &c.; so that Lord Althorp seems to have been right, out of office, when he stated the improvement to be temporary. This was about the time that the great cry for reform was so rife.

June 21, 1831, parliament re-assembled. The speech alluded to "local disturbances; the desire for reform remaining unabated.

January 1833. The speech laments the distress; and talks of peace affording the best and most effectual remedy. This was the meeting of the first reformed parliament. Many petitions were presented complaining of distress. My honourable friend, the member for Whitehaven, brought forward a motion for a select committee to inquire into the distress, and into its connection with the changes in the monetary system, which had taken place since the war. This was resisted by the government, and defeated by a tremendous majority. But two committees were granted, subsequently—one to inquire into the state of agriculture; the other into the state of manufactures, trade, and commerce. Great distress was proved on the first; nothing was done to relieve agriculture; no report was made from the other; prosperity was attempted to be proved, but it failed. The one body, whose distress was undoubted, had no relief granted; the other, which was said to be doubtful in its situation, received immediate relief in the shape of a remission of the house-tax; and this was consistent with the manner in which applications for relief have generally been received in this house.

On the meeting of Parliament on the 4th of February, 1834, the King "laments the continuance of distress amongst the proprietors and occupiers of land." In 1835, he repeats the same, and hopes a remission of local taxation will relieve them. Thus the distress of the agricultural interests has now existed almost without intermission for eighteen or twenty years. I cannot but think it, therefore, to be the most important duty of this House to apply itself without loss of time to the consideration of some really effectual means of relief. No one denies the distress, although some perhaps are not aware of the awful extent to which it has proceeded. Is the country to submit to it any longer? It is no longer to be put off by such delusive apologies as the transition from war to peace. Low prices are peculiar, under ordinary circumstances, to war rather than to peace. Peace, from generation to generation, has been typical only of comfort and blessings; now our philosophers would have it a by-word for ruin and desolation. What were the prices at the different periods of peace and war during the last century?

The following statement was made by the late Marquess of Titchfield in the debate on Mr. Western's motion in 1822:—

|                                             |         |
|---------------------------------------------|---------|
| The War of the Revolution from 1683 to 1697 | £2 10 8 |
| 1698 to 1701, Peace of Ryswick              | 2 12 6  |
| 1702 to 1712, War of Spanish Succession     | 2 4 11  |
| 1713 to 1739, Peace of Utrecht              | 2 0 4   |
| 1740 to 1748, War of Flanders               | 1 15 5  |
| 1749 to 1754, Peace of Aix la Chapelle      | 1 18 2  |
| 1755 to 1762, War of America                | 2 1 10  |
| 1763 to 1774, Peace of Paris                | 2 9 5   |
| 1775 to 1782, War of America                | 2 1 11  |
| 1783 to 1792, Second Peace of Paris         | 2 6 2   |

Making on the whole the price of wheat in peace higher than in war.

So that it is evident there is nothing in the nature of war to cause a rise of prices, unless some other peculiar circumstances are in operation to produce that rise. The peculiar circumstances in operation during the late war were the Bank Restriction Act of 1797, which empowered the Bank of England to issue its notes without being called upon to exchange them for gold. Of course they increased their issues, and just as the issues increased, prices of every description rose. In 1819, the Restriction Act was put an end to, and the Bank compelled to pay their notes in gold; so that they withdrew their issues, and prices fell in proportion; and this was done in defiance of all the engagements which had been entered into at a rate of prices double to those that must ensue; and notwithstanding the actual doubling, in consequence of the national debt. Here is the true secret of all our distress; and because we want a palliation of the mischief, it is said we want to go back to an inconvertible paper currency. We want no such thing, and the accusation is wilfully made to produce an invidious impression against us. We are convinced that the way to remedy an evil is to look to the cause of it; and, therefore, we seek and expect some mitigation of our distress only through some modification of our monetary system.

But what has been done since 1815, when the distress began? We passed a prohibitory corn-law that year, making 80s. the pivot price. Did that raise the price of wheat? No; it fell immediately after. We passed another corn-law in 1822, making 70s. the pivot; wheat immediately rose. We passed a third corn-law in 1828, making 64s. the pivot; wheat rose for two or three years after. It is evident, therefore, that corn-laws have not had the effect of raising the price of corn. What, then, has been effectual in raising the price and removing distress since the war? The facts are distinct and acknowledged. In 1817, the Bank of England, having withdrawn about 3,000,000*l.* of its notes, to prepare for cash payments, again, at the suggestion of government, let out 3,000,000*l.* or 4,000,000*l.* more of its issues, with the express object of relieving the distress. It did relieve it; and prosperity continued until the Bank of England notes were again withdrawn in 1819. From that time adversity continued until 1822, when Lord Londonderry, with the express purpose of relieving the distress, prolonged the existence of the 1*l.* notes. The Bank of England again increased their issues about 4,000,000*l.*, and we again had relief and prosperity. These issues were again withdrawn after 1825, and we have had adversity ever since. The higher prices of wheat of the three years succeeding 1828, were entirely owing to deficient crops. I may be taxed, from what I have said, with being an enemy to the corn-laws; I am no such thing.

As I understand it, Sir, at a certain given amount of currency in the country, you can only have a certain price for wheat. Now, supposing that to be 40s. per quarter, I maintain that no corn-law can raise it beyond that price. The effect of the corn-law, is to prevent foreign corn coming into the market at a cheaper rate, so as to depress it below the natural currency price of (say) 40s. If foreign corn can come in, duty-free, at 30s. per quarter, it will lower wheat in this country from 40s., its currency price, down to 30s., there or thereabouts; so that in the supposed case of 40s. being the remunerating price, the corn-law would be a protection of 10s. a quarter; but supposing we had a currency price of 60s. a quarter, the corn-laws might then be a protection of 30s. a quarter. Let us not hope, therefore, that corn-laws alone will raise prices, or expect any mitigation of our distress, until the causes of it are removed. Effects will only follow causes, and until the causes of it be removed, the effects will never cease.

What, however, has been done since the year 1815 for the relief of agriculture? An Agricultural Committee sat in 1820, 1821, 1822, and they made several Reports; the first of which was July, 1820, with respect to the rumours of smuggling from Guernsey and Jersey; and this was the programme of what is going on now. The farmers cannot be expected to go very deeply into the causes of their distress, especially when it arises from so difficult a source to be understood as the operations of the monetary system. They know that when a greater quantity of corn than ordinary comes into the market, that it depresses the price; they therefore look about them for such an occurrence. They are told that Guernsey and Jersey have the privilege of sending corn here, duty-free, and also of importing foreign corn, duty-free. So they, naturally enough, suppose that fraud may take place. But they will cease to dwell on this as the cause of their distress, when they know that the investigation now going on before a Committee of this House, proves that the whole of the wheat imported from the Channel Islands into this country does not exceed 3,000 or 4,000 quarters. In 1821, there was another Report made, dwelling chiefly upon the causes of the distress, which were in a great measure attributed to the change in the value of money. This Report was understood to have been drawn up by Mr. Huskisson; and it complained of the increased importation of Irish corn, and we are now repeating the same complaint; and we did so 150 years ago, under distress arising from a scarcity of money. The Right Honourable Baronet, the Member for Tamworth, on every occasion, takes great pains to attribute the fall in the price of corn to the importations from Ireland; and yet it is an extraordinary fact, that in the year 1834, wheat fell 10s., though there was much less both of wheat and flour imported from Ireland than in the year preceding, as the following account from Liverpool will shew:—

| From Ireland into Liverpool.                                                                                    | WHEAT.<br>Qrs.      | Oats.<br>Qrs.       | BARLEY.<br>Qrs.    |
|-----------------------------------------------------------------------------------------------------------------|---------------------|---------------------|--------------------|
| Total Import from 1st Oct., 1832, to 1st Oct., 1833.                                                            | 421,414             | 331,561             | 18,280             |
| Ditto from 1st Oct., 1833, to 1st Oct., 1834.                                                                   | 344,174             | 282,109             | 22,352             |
| Increase or decrease during the twelve months ending 1st Oct., 1834, compared with the preceding twelve months. | 77,240<br>Decrease. | 49,452<br>Decrease. | 4,102<br>Increase. |

| From Ireland into Liverpool.                                                                                    | BEANS.<br>Qrs.     | MALT.<br>Qrs.      | FLOUR.<br>Bags.     |
|-----------------------------------------------------------------------------------------------------------------|--------------------|--------------------|---------------------|
| Total Import from 1st Oct., 1832, to 1st Oct., 1833.                                                            | 13,629             | 5,042              | 293,665             |
| Ditto from 1st Oct., 1833, to 1st Oct., 1834.                                                                   | 15,283             | 1,506              | 270,357             |
| Increase or decrease during the twelve months ending 1st Oct., 1834, compared with the preceding twelve months. | 1,654<br>Increase. | 3,536<br>Decrease. | 23,308<br>Decrease. |

The supply of wheat last year, it thus appears, is deficient nearly 20 per cent. from Ireland into Liverpool; the port to which more than half the Irish corn is sent. And yet, in the face of this diminished supply from Ireland, wheat has fallen 10s. 8d. per quarter within the year.

How can it be said, then, that the fall of price is to be attributed to Irish importations—and where shall we go next for a subterfuge to conceal the true causes of the ruinous effects which are in operation? The third Report was in April, 1822, concerning the proposed change in the corn-laws. The fourth Report in May, 1822, related to warehousing corn under the King's lock. The next Committee which sat upon the state of the agricultural interests was in 1833. I had the honour to sit on that Committee, and I never heard more faithful evidence given than was given on that occasion; and this evidence was not exaggerated in the Report which was made to the House; it was drawn up by the Chairman, the Right Honourable Baronet, the Member for Cumberland, who was then in the Cabinet, and the picture of distress was any thing but overdrawn. I will not weary the House by going into the details of the evidence now; the general tenour of it proved that the land had become depreciated in point of produce, in consequence of the necessities of the farmer having induced him to overcrop and scourge it, whilst his poverty disabled him from enriching it with manure—that the tenants were, three-fourths of them, insolvent—that there was a scarcity of live stock, because the necessities of the farmers were so great that they were obliged to dispose of them at two years old instead of waiting the proper age—that agricultural labourers were thrown out of employment, and that a better price for produce would bring them back again into full employ—that even at the then price of 54s. per quarter the cold clays (the ancient wheat soils of the kingdom) must go out of cultivation; besides many other disastrous circumstances with which I will not now trouble the House. I feel bound to state, that instead of these evils having been relieved since that period, they have become tenfold aggravated. Sir, what are the real causes to which we are to attribute this distress? I have stated that the corn-laws have failed to remedy them. I am not prepared to say that I am ready to part with the corn-laws, because, as I have stated before, at a certain point, they are a protection, though they will never give the advanced price which our circumstances require. The true causes of the distress are to be traced, and traced alone, to the change in the currency in 1819.

In 1822, Lord Western told us, that the distress which prevailed was owing to the change which had taken place in the value of money, and he brought forward a motion on the subject, which was lost by a large majority; but on every succeeding occasion in which the currency has been introduced into the House, there have been increasing numbers in favour of that having been really at the bottom of the distress. I have

stated shortly, before, how the farmers were affected by the change in the currency. By a larger issue of paper than war prices arose,—by diminishing that paper, prices were reduced one-half,—and there is no other method of raising prices again, but by some modification of the present money laws, except from scarcity, which is good for neither grower nor consumer. The general principles of this question are so well known to the House, that I will not dwell further upon them, except to say that no one has traced more clearly the connexion between an increased issue of paper, and an increase in prices, than the Right Honourable Baronet, the Premier for Cumberland (Sir James Graham). I know not how he will vote upon this occasion; but I refer to a well known pamphlet of his, entitled "Corn and Currency," published some years ago, which demonstrates how prices have been affected by changes in the amount of the circulating medium. During the debate upon this question, brought forward by Mr. Western in 1822, there were sentiments delivered by gentlemen of high character in this house, which we should do well to call to mind. Among others, Mr., now Sir R. Peel, stated.

Strong as his objections were to the inquiry, he could conceive a state of distress such as would require it; and if he believed the change in the currency had already caused such disasters, and was about to cause still greater disasters, he would then, though reluctantly, acquiesce in the motion.

(To be continued.)

### TITHES! TITHES!

The following intelligent and firm petition, on the subject of tithes, has been numerously and respectably signed, at Hawkhurst, and forwarded to T. L. Hodges, Esq.

"To the Hon. the Members of the Commons House of Parliament.

"The Petition of the Parishoners of Hawkhurst, in Kent,

"Sheweth,

"That your Petitioners, who are chiefly Hop Planters, and otherwise subject to an expensive course of cultivating their soil, have laboured under the worst evils of the existing Tithe Laws, until the burthen of their peculiar grievances compels them again to lay their case before your Hon. House, and once more to implore a measure of general relief.

"That the Tithes of this Parish belong to the Dean and Chapter of Christ's Church, Oxford, who let them for a term of years at almost a nominal rent, subject to a periodical renewal, on payment of a heavy fine.

"Your Petitioners consider this mode of letting as one of the great sources of the evils of the present system and an unfair evasion of the spirit of the law; for the enabling and restricting Statutes require that the rent reserved on such Leases shall be the same or more in amount than has been reserved within the preceding twenty years; thereby meaning that a fair annual rent shall be taken without a fine.

"Your petitioners submit that merely repealing or restoring these Statutes to their true intention would be a considerable benefit to all parties, and take from the Church that painful situation of breaking the spirit whilst keeping the letter of the law.

"In 1812, a former Lease was suffered to expire, and after many fruitless attempts on the part of the Parish to make fair arrangement with the Dean and Chapter, and notwithstanding (as they have heard) the terms offered by them exceeded those ultimately accepted, they gave the preference, and granted a Lease to their own Attorney, through whom the negotiations had been made, and who was thus, in his professional character, acquainted with all the terms and confidential communications which had arisen during the treaty, and thereby enabled to turn them to his own advantage in breach of fair dealing between man and man, and in defiance of the principle established in equity, that an attorney shall not deal with his principal.

"In that year your Petitioners, induced by the expensive nature of their cultivation, submitted to a Composition for five years, according to a valuation of the Surveyor of the Dean and Chapter, and upon the expiration of that Agreement in 1818, when the price of agricultural produce was high, particularly of Hops, with a prospect of good crops, and a probability of prosperity, and when a considerable capital had been expended in bringing the land into its then high state of cultivation, your Petitioners, in order to avoid the ruinous consequences of Tithe in kind (which was their only alternative), entered into an agreement for twelve years, by which they were to pay fifty shillings per Acre for Hops, twenty shillings for Wheat, and twelve shillings and sixpence for Lent Corn, &c., as well as all the taxes upon the tithes.

Your Petitioners need scarcely remind your Hon. House, that shortly after this period the depression of Agriculture commenced and proceeded with ruinous rapidity beyond what any human foresight could have anticipated,—the change in hops was at least from thirty pounds to fifty shillings per cwt., in wheat from ninety to fifty shillings per quarter, and other produce in a similar proportion; yet, notwithstanding all this and in spite of the daily evidence of its ruinous effects, by numerous failures, and unmindful of the great reductions made by other landlords and Tithe owners, the Lessee with (we believe) a few exceptions, exacted the full amount of his claim; and in addition to this, chose a period of the greatest distress (1822) to harass your Petitioners with a vexatious lawsuit to defeat a modus on the grass land, which had before been fully investigated in law and equity and decided positively in favour of the Parish;—this suit cost your Petitioners above 1,100*l* beyond the taxed costs. The consequence was that many an honest and industrious man fell a sacrifice to these exactions and burthens. When the agreement ended the Lessee commenced a course of litigation against all those who were in arrear, or where any question of his rights had arisen, and after driving the parties to all the expenses of vexatious and protracted lawsuits up to the moment of trial, he consented to a compromise upon terms which had been offered at first to avoid litigation.

"The year following the termination of this Agreement (1831), there then being a prospect of bad crops, he received a composition upon the valuation of his own agent, and in the next year he agreed in the same manner for all produce except hops, with a pledge to agree for them also, as soon as the extent of the crops could be ascer-

tained, but no sooner was the corn tithe harvested, and his composition upon that secure, than he proposed such terms for the hop land, as he well knew it was impossible to accede to, and the consequence was, that with one or two exceptions, the hops were taken in kind. From that period he has continued to take the whole tithes in kind, and not only subjected your petitioners to all the annoyance, loss and vexation which inevitably attends a strict exaction of the legal rights of the tithe owner, but also involved them in a continued course of litigation; for he not only compels them to sue for the poor's rates, but absolutely refuses to pay the highway rates, without assigning any reason for so doing, and at this moment his arrears of highway rates only, exceed 300*l*, and there are four lawsuits pending against him, which he conducts with the utmost hostility, grounding his defence on technical objections and not on the merits, —the evil of heavy arrears in parochial taxes, are too evident to require being set forth, but if all adopted the same course, the poor must starve and the highways be neglected, until the law could vindicate their rights, and in this case, notwithstanding the most able counsel have been employed, the pleadings, after nearly two years litigation, stand for argument upon demurrers, and as there are many cases before them, they are not likely to be heard for another year:—he also neglects to keep the chancel of the church in proper repair, and refuses to pay for some work done to it by the order of his own agent. Before leaving this part of the subject, your petitioners beg to observe, that there is great difficulty under the present mass of the highway acts, so to levy and enforce payment of the rates as not to be open to the ingenuity of a special pleader, and that before those or any poor's rates can be recovered, it is necessary to make a demand of payment and serve summonses, which must be personal, or at the residence; and as the lessee lives more than one hundred miles from the parish, the expense of constant journeys by the parish officers, is a very great tax, and if only that portion of the law were amended and the highway acts consolidated and simplified, it would effect a considerable saving both of money and trouble.

"The following statement will assist in showing the pecuniary losses which your petitioners have suffered, when compared with the surrounding country, during the twelve years in which your petitioners were paying under their agreement, fifty shillings per acre for hops, twenty shillings for wheat, and twelve shillings and sixpence for Lent corn, the neighbouring parishes were paying upon an average fifteen shillings for hops, ten shillings for wheat, and four shillings and sixpence for Lent corn, making a difference as under:—

|                                                            | Average quantity of acres each year. | Difference per acre. | Annual difference upon total quantity. | Total difference during 12 years. |
|------------------------------------------------------------|--------------------------------------|----------------------|----------------------------------------|-----------------------------------|
| Hops.....                                                  | about 420 acres                      | 35 shillings         | 735                                    | 8,820                             |
| Wheat....                                                  | about 560 acres                      | 10 shillings         | 250                                    | 3,000                             |
| Lent Corn, ..                                              | about 700 acres                      | 8 shillings          | 250                                    | 3,360                             |
| Law expenses, including the modus sent, not less than..... |                                      |                      |                                        | 2,000                             |
|                                                            |                                      |                      |                                        | £17,180                           |

Thus making a difference of above £17,000. And when to this is added the great loss of subsequently taking the tithe in kind, and the deterioration in the value of land in the parish, occasioned by these circumstances, the sacrifice is too great not to demand unceasing efforts for a remedy. One individual, not a large occupier, who kept an account of the produce of his land during the agreement, states, that he paid £500 more than the tenth of his produce realized.

"Your petitioners cannot refrain from observing, that notwithstanding the very large sum taken from the parish for the church, the curate (it being a perpetual cure) is allowed (with reference to his station in life) a bare subsistence, that it is impossible for any person to take the living, and keep up the house, without a private fortune of his own; and that this large and populous parish (for the country) is only treated as a stepping-stone to higher preferment. The consequences are, that the cure, upon a vacancy, goes begging to be supplied, until some person is found willing to give him time and property until something better offers for him. That the parish has frequently been left for months without an officiating minister, and the constant changes prevent that union of interests and good fellowship which ought to exist between the ministers and parishioners.

"Your petitioners have long since stated their grievances to the dean and chapter, urging them to intercede and mediate between them and the lessee, but its only effect was to elicit a perfect indifference to their situation.

"Your petitioners having before sent a separate petition, praying for a general settlement of the tithe question, and joined in others to the like effect, refrain from troubling your hon. house with a repetition of the various reasons upon which they were founded. And having now stated their pecuniary sufferings, they leave your hon. house to judge of the other evil effects which the circumstances detailed in this petition must create, and their tendency to generate ill-will and dissatisfaction with the source from which they spring, and with all parties who do not hasten to provide a remedy, assuring your hon. house that they anxiously desire to support the church, and as the best means of doing so, to take from it only such matters as by length of time, and alteration of circumstances have become dangerous to its existence if suffered to continue unnoticed.

"Your petitioners therefore pray your hon. house will be pleased to take the whole question into its immediate consideration, bearing in mind that tithes were granted when the present mode of artificial and expensive cultivation was not known or contemplated,—when the pauper population did not rest so heavily upon the land, and when the other outgoings of the farmer bore no proportion to the present demands upon him. And that such remedy may be applied as will at least stop the ruinous and vexatious power at present vested in the tithe owner, particularly over a hop district. And that such other relief may be granted as the circumstances detailed in this and the numerous other petitions presented to your hon. house may seem to require.

"And your petitioners, as in duty bound, will ever pray, &c."

## AGRICULTURAL REPORTS.

## SUFFOLK.

Since our last report, we have upon the whole, had an exceeding fine time for the in-gathering of the clover and hay, and which we have pleasure to state is more than an average bulk. On the 24th and 25th ult., we had unusually high winds accompanied by heavy rain, which lodged the greater part of the crops, and, during which time, the wind shifted to nearly every point. The wheats are very much broken down, particularly those rather light in bulk, which will cause an uneven sample; barleys are twisted in all directions, the quality of which will be decidedly injured by being lodged so early. The young turnips are looking healthy, and should they escape the attack of the fly for another week, will be out of danger. The price of wool has receded since our last; the wool fair at Ipswich nearly proved a failure, we mean for the transaction of business, and we fear the small quantity of business done (only one parcel of wool sold), and the decline instead of increase of prices realised at the fair, will do any thing but establish a wool fair for Suffolk. Indeed, we know many wool growers anticipated making 60s per tod of the best hogget wool. Harvest will not be so early in this county this year as it was last; should favourable weather ensue it will be generally commenced about the first week in August. As we anticipated, the value of trifolium incarnatum seed is barely one-third the price of last year, and at present hardly saleable at that reduction, as it is not yet known what demand there will be for it, and the produce of the seed is so abundant (from three to four sacks per acre) that a small breadth will supply a great many fresh growers, even should its culture become general.—July 16.

## NORFOLK.

The period has arrived which enables us to judge with some degree of accuracy as regards the condition of the crops, to which we are looking for the supplies of another year, and which are now fast approaching towards the season of harvesting. It will be recollected that at the time of wheat sowing there was, and had been for some time previous, a great want of moisture, in consequence of which many of the wheats did not plant well; this circumstance operated to a given extent on all soils not previously pulverized by summer tillage, and with regard to such lands we have ever since expressed an opinion that the plant was meagre and unpromising, nor is this opinion at all modified at the present moment, or do we hesitate to assert that the crop of wheat is exceedingly variable in its character; one portion, perhaps nearly a moiety, promises a productive harvest, whereas the other exhibits a manifest deficiency; and, taken as a whole, we believe it to be the opinion of farmers in general, (we allude to Norfolk only), that it is somewhat under an average crop. Barley and oats have improved of late, that is to say, those upon rich soils which had been injured by the wire-worm, and although there is some falling off in particular districts, the general appearance of the crop is satisfactory. Beans, peas, and all other leguminous crops are universally more promising than we have noticed them to be for some years past, and the low state of the thermometer, which even on the night of the 28th indicated the presence of frost, is a sufficient guarantee for the non-appearance of the *green aphid* or plant louse. The two successive wet days of the 24th and 25th came rather inopportunistically for the hay, a large

portion being then upon the swathe—the crop is heavier than was anticipated previous to its being cut, but even two wet days succeeded by others dull and uncongenial have in some measure deteriorated the quality. Turnip sowing is almost completed, the first are nearly fit for the hoe; no mention is made of the turnip fly, nor is there any reason to anticipate at the present moment any thing less than a full and thrifty plant. Grass is rather plentiful than otherwise, consequently the price of lean is proportionably high; lambs meet with a ready sale, and the grazier has more reason to be satisfied with the price of meat than he had during the early part of the season. Wool perhaps is a trifle lower than it has been, at least the buyers exhibit less inclination to purchase.—June 30.

## EAST RIDING OF YORKSHIRE.

The variation of the weather which we noticed in May, has continued through the month, which has just now closed upon us. That luxuriance of vegetation which was encouraged by the refreshing showers that fell pretty generally about the third day, was promoted by the heat of the atmosphere which succeeded; and again we have had a full supply of rain during the last week, to moisten the soil for turnips. The only drawback, therefore, relative to the weather, has arisen from the occasionally severe frosty nights which have been interspersed through the month. We ought, however, to be grateful to that merciful Providence, which has blessed us with a season favourable on the whole to the success of farming operations, though sufficiently indicative of our uncertain climate.

Wheat, upon strong soils, fully maintains its promise, and affords reasonable expectation of a full crop; upon lighter lands, it has not recovered the effects of the injury, which it sustained in March and April—it is thin and weak in the straw, and will be deficient in produce. Beans are more than usually promising; and this observation extends generally to their sister tribe, peas and tares. Barley is likely to be a productive crop; but the Oats seem again generally to be somewhat below mediocrity. We are often deceived in early prognostics relative to crops; in none more so than in clover and young grasses. The season for sowing these was apparently very favourable; they vegetated quickly, and rose thick upon the ground in April; but if we are not mistaken, they suffered greatly from the severe frosts which occurred during the latter part of that month, and early in May. In many fields, the plants entirely disappeared before they attained the clover leaf; and generally, upon examination, among the growing crops of corn, they appear to be thin and irregular. In such instances, perhaps even yet, a half seed would be well bestowed in an attempt to increase the number of the plants; the growing corn would afford shelter; and where the soil is not very strong, the earth is sufficiently moist to promote their vegetation, whilst lying on the surface of the soil.

The fly has been very busy with the Swedish and other early sown turnips, and where a full quantity of seed has not been allowed, the injury is serious. The sowing of turnips is now going forward, and we would therefore earnestly recommend an increase in the quantity of seed, and the universal use of the *drill*, with early and frequent hoeing by horse and by hand.

Potatoes are a variable crop, and many growers of them have again suffered from that new disease, which is now becoming too well known, under the term of the "dry rot." Further inquiry into the causes of this devastation, and the means of avoid-

ing it, is a useful object of research for all agricultural associations.

The scythes are now in requisition, and the weather for hay making is highly favourable. The crop will be rather light, but it is in vain to hope for increase by delay. Salt, in the proportion of 14lb. sprinkled among a ton of hay, in the stacking of it, gives it a peculiar relish for all stock, and has a tendency greatly to improve the health of sheep. Its application in this mode occasions little trouble, is a small expense, and highly beneficial.

The markets have not varied very materially during the month, either for cattle or for grain. Beans are in the most request, and of equal value per bushel with wheat: inferior samples of the latter are now, perhaps, the cheapest grain that can be given to cattle.—July 1.

#### WOODBRIDGE.

The weather has been very hot and dry during the week, and the corn is maturing rapidly. Wheat reaping will commence on Monday week, and be general in fourteen days. This crop is variously spoken of; from all accounts it appears the quality is likely to prove light and uneven, and the quantity not so large as the last two seasons. Barley promises most abundantly, and quality fine. Beans are a partial crop—on the whole an average produce is expected. Peas a great crop, and large in breadth. Oats are also good. Red suckling, trifolium, and trefoil, are all harvested in a very fine condition: the two former fine quality, and yield largely; the latter is of good colour, but the seed small—the crop an average, but the breadth left short. Turnip-seeds are a deficient crop.—July 18.

#### WILTSHIRE.

The unnaturally gross appearance of the Wheat crop in the month of May was succeeded by a more healthy hue as it came into ear, and the prospect before the rain of the 24th of June was as good as ever known. So much of the Wheat crop laid at so early a period has seldom been remembered, and it is difficult to judge of the consequence, but we must expect a larger proportion of lean and ill-ripened grain, and a continuance of wet will have a bad effect on it.

The spring crops are promising, but more particularly the beans, and from the failing crop of last year, and the supposed less quantity planted in the present year, it is probable that the price will still keep proportionably high. The quantity in the farmer's hands has not been so small for many years, and this observation may apply to spring corn generally.

The quantity of Wheat in hand is supposed to be an average. The few large holders in the country may make up for the very many farmers who have little or none, and so bring the proportion to be about equal to that of other years.

Early turnips and Swedish turnips are promising. The cold rain of the 24th and 25th of June was very serviceable to them. The result of the crop of other winter turnips will not be known for some weeks to come.

The crop of hay is good, and nearly all secured in excellent order.

The prospect of the renting farmer is not improved. The income and expenditure (particularly for labour and tradesmen's bills) are quite out of order.

Thanks to the Poor Law Amendment bill, and in some degree to the low price of the necessaries of life, the expenditure on account of the poor rate is declining, so that some little relief may be looked for in the next year on this score.

The number of farm labourers out of employ is

much less than in the corresponding month of the last year. And those who have had constant work are better off than they usually are.—July 10.

#### NORTHAMPTONSHIRE.

The reporters for most counties say that the crops of wheat are very abundant, but in the writer's opinion, if wheat makes 5l per quarter the next season, it will not make more per acre than it has in the present year, which has been most ruinous to the farmer, as has been proved, and still will be proved by the country newspapers, of advertisements of farms to let, and will be likewise ruinous to the proprietors, as in some places farms of 200 acres, for which the tenant's rent was to be 50l per annum, but not being paid, the landlord asked him on the Market-hill for the rent, when the tenant replied "if you do not give me 50l per annum, I will not continue in the farm;" but the landlord, being a man of business from childhood, and knowing that little incomes would not support great outgoings, thought it would be better to make a compensation to give his tenant 50l a-year to occupy his farm in an husbandman-like manner, rather than be plagued and teased to lose 100l a-year besides the interest of his money employed upon the same farm to stock it, and to pay other expenses.—July 6.

#### DURHAM.

For the last three weeks or a month, the weather has been very dry and parching, and during that time we have been visited with most awful thunder storms accompanied with strong winds and hail storms, which have done considerable damage to the growing crops, windows, and many lives have been lost by the electric fluid.

The wheat crop in many situations has suffered seriously, partly by being cut and shattered by the hail, and partly by the strong wind which broke it down, loosened the root &c., the consequences of which cannot at present be estimated or calculated upon with any degree of precision; but it is obvious there must be an imperfect maturing to a great degree, but such a calamity would not have been so seriously felt when corn was sold at 7s or 8s per bushel. A little failure in one crop could have been got over, but now, when it is little more than half that price, it is feared such a failure in the staple crop will be more serious in its consequences; such a calamity, added to what was previously considered a light, and considerably under an average crop, will, it is to be feared, fall heavy upon many a poor and industrious farmer, who had struggled hard to keep his head above water for a series of years past, in hopes of some change of fortune, but will now be broken down in spirit, as well as his purse. As before alluded, the wheat crop is much below an average, as far as can at present be judged upon, being then on the ground with a pale withered blade; this applies to the great bulk of wheat lands. Then, on the other hand, upon loamy alluvial soils some fine looking crops, which have in many instances been much beaten down with the storms of hail. Oats are also, upon the great bulk of arable land, looking short and thin on the ground. The early-sown turnips are looking healthy, and promise, so far, to be a crop; but they are yet in their infancy. The hay harvest is now pretty general, and the crops of seeds, owing to the failure of the clover, will be light, and there being little stock of old hay the prices have advanced of late.

Fat cattle are in good demand, and good fat beasts, of not too large weights, are from 6s to 6s 6d per stone of 14lbs. Mutton, of light weights, are 6d per lb. sinking offal.

## AGRICULTURAL INTELLIGENCE, FAIRS, &c.

**INVERNESS SHEEP AND WOOL FAIR,** July 15.—Thursday, Friday, and Saturday last were the days of our annual market for the sale of sheep and wool. The market begun very unpromisingly. Thursday was totally a blank day, and Friday was nearly over before any of the principal lots were sold. When the ice was once broken, however, sales were rapidly made, and we believe we may safely state that the market has been a good one, with fair prices, and fully an average amount of business transacted. Last year prices were too high for the purchasers both of wool and sheep, and this year there has been a reduction of about 4s per stone on Cheviot wool, 6s on the double stone of black-faced, and 3s on Cheviot wethers per head. Ewes were greatly in demand, and the unfavourable spring having operated very injuriously in some of the districts, lambs were scarce, and fetched good prices. The highest price of Cheviot wethers was 27s 6d, and ewes 20s 6d. One fine lot of black-faced wethers brought 18s 9d each; another, 18s 6d. Cheviot lambs were within 6d of last year's prices, being sold as high as 11s. A fine lot sold at 11l the clad score, delivered at the fanks. One dealer from the south bought several lots of half-bred lambs at from 8s 6d to 10s 6d, and black-faced 7s. The highest price of Cheviot wool was 20s 6d per stone; another clip brought 20s 3d, and several 20s. One small lot of white hog wool washed (of which there was hardly any in the market, and which is applicable for combing in the manufacture) sold at 32s per stone. The following is a statement of the prices that were obtained:—

|                                   | SHEEP. | s. | s. | d. |
|-----------------------------------|--------|----|----|----|
| Wethers—Cheviot.....              | 22     | to | 27 | 6  |
| Do. black-faced.....              | 15     | to | 18 | 9  |
| Ewes—Cheviot.....                 | 18     | to | 20 | 6  |
| Do. black-faced.....              | 10     | to | 13 | 0  |
| Lambs—Cheviot.....                | 8      | to | 11 | 0  |
| Do. black-faced.....              | 7      | to | 8  | 0  |
| WOOL.                             |        |    |    |    |
| Cheviot, washed, per st. of 24 lb | 10     | to | 20 | 6  |
| Do. unwashed, do.....             | 15     | to | 16 | 0  |
| Black-faced, per double stone..   | 19     | to | 20 | 6  |
| Cross, unwashed.....              | 12     | to | 14 | 0  |
| Do. washed.....                   | 14     | to | 15 | 0  |

We understand that wool was sold, a few days previous, by Mr. Brown, of Linkwood, at 1s above the highest price at Inverness market, namely, the Morayshire clip at 21s 6d, the Rosshire clip at 20s, and first cross at 17s. The English wool market is in a healthy progressive state. This year a greater proportion of Highland wool was laid, or smeared, than usual, to preserve the sheep on the high grounds.

**SHERBORNE FAIR** displayed a larger supply of stock of all descriptions than has been seen for many years, particularly of poor Devon oxen. Buyers were also plentiful; and the sale was consequently brisk at somewhat better prices than have been recently quoted. Prime beef sold at 9s 6d a score. Sheep were not in much request, but lambs sold well.

**THE FAIR AT PROBUS**, was abundantly supplied with stock of every description, and both sellers and buyers appeared satisfied with the business transacted during the day. No material variation in prices.

**At PENRYN FAIR**, the supply of cattle was small, and but few sales were effected, at prices rather on the advance.

**GLASGOW HORSE MARKET.**—The town was on Wednesday thronged with people from the country; and the cattle market with a respectable supply of horses, although the exhibition could scarcely be said to equal that on Whitsun-Monday. Between 700 and 800 were brought forward. The attendance of purchasers was not great. The highest prices of draught horses were from 30l to 35l, with the exception of a few very superior animals, for which as high as 40l were refused. Other descriptions of horses were from 28l downwards, according to quality.

**At STOBBS FAIR**, the show of cattle was rather limited—scarcely so extensive as last year. Fat sold for about 7s per Dutch stone. There were few sheep offered for sale. Everything, comparatively speaking, went off quietly.

**At JOHNSTON FAIR**, the supply of all kinds of cattle was considered plentiful, and the prices high. Before the close of the market the price both of milch and small Highland cows were rather on the advance; the former sold at from 8l to 12l according to their condition; and the latter, which were principally two year olds, sold at from 3l to 5l.

**At OVERTON SHEEP FAIR** the supply was short—about 10,000 less than last year, which caused an advance of from 2s to 3s per head. It is said that 50,000 were sold within an hour.

**At KENNINGHALL FAIR**, in Norfolk, on the 18th instant, there was an unusually large supply of lambs, which met with an exceedingly dull sale at 1s or 2s per head below the late prices, varying from 12s to 22s each; full a third of the lambs penned remained unsold. We cannot be surprised at this depression when we consider that hogget wool is now about 10s per tod lower than last year; mutton since Christmas has been 1d per lb lower, and wheat, during the same period, 5s or 6s per coomb below last year's prices.

**COLCHESTER NEW FAIR.**—This fair was held on Thursday last, but the show of stock was not very large, and the horses chiefly of an inferior description; there was a fair supply of sheep. But little business was done, and that at reduced prices.

**ST. BOSWELL'S FAIR.**—There was a very good show of bred and half-bred lambs, but rather a poor show of Cheviot lambs. The market was brisk at the commencement, but became rather flat afterwards; however, very few lambs were left unsold. Best bred lambs may be quoted at from 20s to 23s 6d; half-bred, from 15s to 18s; Cheviot lambs, best, from 9s to 11s; and inferior lower in proportion; half-bred hogs, clipped, brought from 22s to 26s. There was a middling supply of grazing cattle, and a tolerably good demand. Two-year-olds sold from 3l to 10l 10s, and year-olds from 5l to 6l. There were few fat cattle in the market, which brought 6s per stone. There was a very great show of horses, though principally of an inferior description; superior horses were sought after at good prices. There was not a great deal of business done in the wool trade, the purchasers insisting upon a still farther reduction of price; what sales were effected were at prices something below those of previous markets. The linen market was pretty well supplied both with Scotch and Irish; each kind sold at about last year's prices.

**THE WEATHER AND CROPS.**—The weather having at length assumed an appearance of settledness, suitable to the advanced period of the season, the extent of the injury done to the crops may be now pretty correctly estimated. The effects of the high winds some weeks ago are now visible upon the

wheat—these having taken place when the plant was long and weakly, a great deal of the crop was broken over near the ground, and is indicated by the whitened and empty head. In the Carse of Gowrie the damage from this cause is estimated at about  $1\frac{1}{2}$  bolls on the acre; but in some more exposed situations the loss will vary from one-fifth to one-fourth of the entire crop. To the other kinds of grain the winds have done little injury, the stage of their growth having fortunately caused their escape. Green crops have improved much by the late rains, and the third sowing of turnips has been established where two former had failed. Potatoes have also improved greatly, and the blanks are not so visible as some weeks ago. New hay is selling at  $5\frac{1}{2}$ d to 6d in the tramp cole.—*Perth Courier*.

**ARUNDEL.**—The harvest is progressing in full force in this neighbourhood.

We understand that the wheats now growing on the fine light soils near the coast of the English Channel, are, in consequence of the present warm and genial weather, ripening rapidly, and that should no untoward rains intervene, the reaping-hook will be in active requisition on Monday next. The crops, we are happy to state, exhibit an appearance of the most abundant kind, such as ‘to cheer the heart of man,’ and to call forth the praise and gratitude of all classes to the ever bountiful Giver of all Good. It is highly probable, from present appearances, that on Saturday the 1st of August, new wheat will be exhibited in Dorchester market. The cutting of wheat commenced yesterday (Wednesday) in the vicinity of this town. The harvest has also commenced in the neighbourhood of Salisbury.—*Dorset County Chronicle* July 25.

**THE HARVEST.**—We have within the last fortnight had an opportunity of passing through a large tract of Norfolk, principally, however, on the South and Western sides. Nothing can look more promisingly than the general crops both of wheat and barley, though with some partial exceptions. It would be a great national benefit could the farmers of England inspect the crops now growing in Holkham Park, and the lands of Mr. Coke's tenants—that identical land which was refused at five shillings an acre, tithe-free, when he came to his estate. Upon this noble domain there are upwards of 400 acres of wheat, computed to yield at least eight coombs per acre—barley from 15 to 17, and upon one piece in the occupation of Mr. Wiseman, it is not doubted there are 20 coombs per acre. We never saw corn stand so thick or so heavy in the ear. The mangel wurzel is fine and flourishing, and the turnips made as certain a crop as any grown by the ridge system of cultivation. And all this in spite of the head of game and rabbits reared by the proprietor, who still enjoys field sports with the ardour of youth. If it be inquired how all this is achieved upon a soil naturally far from the most fertile, we must answer, it is the triumph of skill and capital. When Mr. Coke came into possession, 800 indifferent Norfolk sheep walked where 4,000 of the most perfect breed in England are now depastured—notwithstanding from 1,000 to 1,500 acres of land have been since planted. About 200 Devon oxen are sent to Smithfield yearly from the same fields—and, instead of horses, Mr. Coke now employs only the store stock for all his ploughing. More than forty cows feed daily upon his lawns. The cattle enrich the soil, and the soil in its turn gives sustenance to the cattle and the abundance of its crops. So long as the Holkham sheep-shearing continued, these facts were continually subjected to a wide and beneficial observation, and we feel that we do a little towards extending the ad-

vantages by recalling recollection to those noble by-gone scenes of science and hospitality, and by making known the successful continuation of the supremely excellent system of cultivation still pursued under the same liberal and energetic management.—*Norwich Mercury*.

Notwithstanding of a fortnight of cold and rainy weather, the crops appear to be splendid, more particularly on mossy soils. The wheats, which have been in ear for some time, appear to be remarkably well-headed, and the oats, we are glad to say, are ragging at last. Still the harvest will be from a fortnight to three weeks later than last year, and we need not remind our agricultural readers, that lateness is always accompanied with risk. The hay harvest has been sadly interrupted, and at this moment, we suppose we may say, that about a third of the crop is in rick, a third in the swathe, and a third uncut. From the low state of the temperature, we are inclined to believe that but little harm has been done as yet. A day or two ago a friend forwarded to us, from the estate of Cavens, a few ears of barley and bigg, perfectly ripe, with specimens of a particular kind of clover, the exact character of which we could not make out. The said barley and bigg, which formed part of a field of some extent, must have been sown either very early, or under circumstances so peculiar, that they deserve to be made known.—*Dumfries Courier*.

We have had an opportunity this week of observing the condition of the crops in a great many counties adjoining our own district, and are enabled to pronounce it to be generally, most promising; while in some particular places, and those not a few, it almost exceeds, in healthful luxuriance, anything of the kind we ever saw before. Our remarks particularly apply to wheat, barley, beans, and turnips, of which we have seen some of the finest crops that ever rewarded the labour of the husbandman. Almost every where wheat and barley are good crops—and more especially wheat; but oats in many places are somewhat scanty. The crops of all sorts must be considered backward—in many situations harvest will not be general before the latter end of August for wheat, and the beginning of September for oats. The state of the weather, which has this week been settled and fine, will under these circumstances be a subject of great anxiety.—*Carlisle Patriot*.

Nearly six hundred head of cattle have been imported into Worthington within the last ten days.

A jackdaw belonging to Mr. John Eaglesfield, of Maryport, died on Friday last, which was known to be nineteen years of age.

Seven hundred and eighty-two head of cattle have been landed at Maryport since the 4th instant, from Ireland.

**THE CHOLERA.**—It seems now pretty well ascertained that this disease, as experienced in England, originates in a disordered state of the stomach and bowels, brought on very commonly by the unlimited use of fruit, or from that which is almost unavoidable in this extremely hot weather, the indulgence in fermented or acid liquors. The most wholesome and efficacious remedy hitherto discovered for preserving or renewing the tone of the stomach is beyond all question, “Woodhouse's essence of Ginger.” In addition to the recommendation of the highest members of the Medical Profession, his Majesty has, within these few days been pleased to extend his Patronage to Mr. Woodhouse, and we are fully persuaded that it will speedily become an article of general use.

## RETROSPECT OF THE WOOLLEN TRADE.

The German Wool Fairs are now all ended. This annual foregathering of growers with dealers and consumers, not of one district or country, but of all districts and countries, at the season when the produce of the year is to be brought out for disposal amidst competition so general, and under circumstances so favourable for acquiring general information, and acting upon comprehensive views, is an occurrence which may well be regarded with much anxiety by all parties interested in the woollen trade. Different anticipations had been formed as to the probable result of these fairs; yet the general impression was that the previous moderate prices would again be accepted, if even some reduction upon them were not submitted to. Persons whose views or wishes led them to countenance the contrary expectation did not fail, however, to labour in their vocation:—the knowing look, the important shake of the head, the mysterious shrug of the shoulders, were not wanting to produce the desired effect, and they had already so far operated that the clothiers began to threaten an advance upon their *next* goods, only they took care not to refuse a saving price for those they had on hand.

We need not, therefore, be surprised if the same parties who then made it their object to encourage such a feeling, should now find ample scope for the exercise of their ingenuity in explaining, in modifying, and, perhaps, in mystifying a little, such actual results as do not square with their prognostications, and yet may not be more openly impugned. Accordingly, we may still be assured that there did exist the fairest imaginable prospect of advance, and that but for certain little contingencies, which no human foresight could have calculated upon, such prospect must inevitably have been realized. It is really mortifying to think "what dire mishap from trifling causes spring;"—how the brightest hopes may be defeated through the casual neglect of some minute point of very inferior importance in itself. At one of the earliest Wool Fairs, where growers and buyers were assembled, with hopes thus elated on the one hand, and a corresponding eagerness to purchase on the other, it was found that the wool was in such a state from imperfect washing, that no one but a first-rate judge could distinguish its quality. Of course the discriminating few had it all their own way; they held the unhappy grower between their finger and thumb, whilst their hesitating competitors were all at fault. Can it be matter of astonishment that under such circumstances the promised advance should not be realized? We are delighted, however, to find that means have been discovered to avoid such a catastrophe for the future. It is proposed that a number of MICROSCOPES be provided, of adequate power, and as high, we believe as 20 $\times$  each in value. Each buyer will be armed with one of these formidable instruments, and it will then be no longer in the power the keen-sighted catiff to take advantage of the less perfect visual capacity of his neighbourhood.

Another cause which has contributed to disappoint the rational hope of advance has been the difficulty of transporting the buyers with sufficient celerity from fair to fair, so that their force might be brought to bear in compact union upon the required point. This, too, will be remedied. The Germans, with all their good qualities, have hitherto been but a slow-travelling people. On their common roads, we grieve to say, their rate of progression has hardly exceeded

two miles and a half an hour, and a friend who has just returned from his tour to the fairs, assures us, almost with tears in his eyes, that even on the best Macadamized roads the *Schwager* is not to be induced, for love or money, to urge his steeds beyond the rate of five miles an hour. But railways are now the all-engrossing topic in Germany. In the coffee-house, at the table d'hôte, in public places, and in domestic retirement, nothing is spoken of but railways. The newspapers all teem with projects of lines from North to South, from West to East; from Hamburg to Vienna, and so on to Constantinople; from Rotterdam to Berlin and St. Petersburg, and so on to the frozen regions of Siberia. Let it not be apprehended that projects of this magnitude are all too slow of development to warrant us in looking to them for immediate relief. German enterprise is not easily awakened, but once in motion it knows no limit; like the famed wooden-leg of Meinherr von Wodenblock, the spring once touched nothing can stop its progress. It will not brook the tedious process of levelling and forming—the railways will be purchased ready-made, and fit for immediate use.

We have been insensibly led thus far astray by the contemplation of prospects so animating; but '*revenons à nos Moutons*,' let us come back to our Wool Fairs.

We have reports from a great number of places, at some of which fairs have been held for the first time; for so greatly has this branch of German industry become extended that we may say

"Fairs are now held where none were held before,  
And those who always held now hold the more."

We select a few of the principal fairs for the purpose of exhibiting the quantity brought to each, and, as far as we possess the means, a comparison of the present with the two preceding years:—

| Quantities in Cwts. |        |        |                                                                                                |
|---------------------|--------|--------|------------------------------------------------------------------------------------------------|
| Breslau—            | 1835.  | 1834.  |                                                                                                |
| From Silesia        | 34,797 | 32,748 | In 1833, Silesia, 28,196 cwt.; the total quantity in that year would hardly exceed 36,600 cwt. |
| .. other parts      | 15,305 | 11,588 | In 1833 about 21,000 cwt.                                                                      |
| Total               | 51,102 | 44,336 | Left unsold 3,317 cwt.                                                                         |
| Berlin, about       | 40,000 | 35,000 | } Quantity greater, and prices lower than in former years.                                     |
| Stettin.....        | 20,656 | 24,000 |                                                                                                |
| Warsaw .....        | 15,000 | .....  | } Buyers from England, Berlin, Stettin, and Breslau.                                           |
| Leipzig .....       | 6,627  | .....  |                                                                                                |
| Weimar, about       | 4,000  | 2,500  | } Prices from 60 to 110 dollars; about 10 dollars lower than last year.                        |
| Gotha .....         | 1,600  | 315    |                                                                                                |
|                     |        |        | Quantities actually sold.                                                                      |

It is evident from this statement that, notwithstanding the increase in the number of fairs, there is no lack of supply for them all in abundance. It would, of course, be wrong to take this increase of quantity as a measure for the increase of produce, because we do not know how the private transactions stand, relatively, in the different years, but there is no question that the produce itself has increased amazingly.

A quotation of prices for an article which varies so much in quality as wool is in most cases of little value. It hardly conveys a more definite idea than did the intelligent witness in a trial for assault, who described the stone thrown as about as big as a lump of chalk. Such, generally, is the merit of our price current quotations of wool. But for the purpose of comparison between different periods of time, if we only know that the same quality is always designated by the same name, a quotation will an-

swer just as well as actual inspection. We give the prices as quoted for the Berlin fair for the same three years :—

|                                                                                | Rix dollars per cwt. |     |       |      |       |     |
|--------------------------------------------------------------------------------|----------------------|-----|-------|------|-------|-----|
|                                                                                | 1833.                |     | 1834. |      | 1835. |     |
| Ordinary .....                                                                 | 45                   | 50  | 42½   | 47   | 40    | 50  |
| Good ordinary.....                                                             | 62                   | 72½ | 62    | 72½  | 60    | 75  |
| Middle.....                                                                    | 80                   | 90  | 85    | 92½  | 82½   | 95  |
| Fine middle.....                                                               | 90                   | 100 | 92½   | 95   | 92    | 96  |
| Fine.....                                                                      | 110                  | 125 | 105   | 112½ | 100   | 105 |
| Extra Fine.....                                                                | 140                  | 150 | 130   | 140  | 115   | 125 |
| Some parcels of extraordinarily<br>fine and well managed wools<br>fetched..... | 150                  |     | 160   |      | 150   |     |
|                                                                                |                      |     |       |      | 150   |     |

For rough calculation it is usual to consider three dollars per cwt. equivalent to 1d per lb.

No person who has observed the course of the wool trade during these three years can fail to be struck with the remarkable approach to uniformity in price which this statement exhibits. The variations upon the most useful sorts will scarcely exceed 1d per lb., whilst in the interval of a year, between one clip and another, we have actually had the same sorts fluctuating as much as 1s. per lb., or from 30 to 50 per cent., and this, too, without any thing in the demand for goods, or the state of the trade generally, sufficient to account for the variation. If such person, however, will but cast his eyes around him, and remark the sort of hands into which the wool trade has fallen of late years, he need not be at a loss to assign an adequate cause for this pernicious state of things. At the Breslau fair, we observe, there were no less than 166 Jew dealers present from the neighbouring states, in addition to the Anglo-German migratory tribe. Our own portion of this latter detachment is yet on the increase. We have to report numerous accessions to it in the course of the past year, and we know but of one secession from its ranks. The light of one countenance, we find, has been permanently withdrawn from us. We believe the trade "could have better spared a better man;" but they cannot be allowed to pick.

The cessation of the war left a chasm in the employment of capital for speculative purposes which the wool trade has filled up. Loan-jobbing and stock-jobbing have given place to wool-jobbing. Goods-jobbing was tried at first, but with less brilliant results, and Manchester yields the *pas* to Leeds. The older occupants of the wool sack are no longer the fountain of precedent. They may not do violence to their consciences by the practice of all they learn, nor may they stultify themselves by the belief of all they hear; but yet they must keep up the appearance of humbly following in the wake of the new authorities, who thus find their views and opinions sought after and listened to with as much reverence as if they were expounding the mysteries of the Talmud.

The wool trade has acquired the character, good or bad, of being particularly easy to manage. The article, certainly requires no preparation, but may pass from hand to hand without change of condition. Hence the prodigious increase of second-hand wool dealers which the trade has experienced of late years; and hence, too, the facility which buyers of doubtful character or pursuits enjoy of providing themselves. Such buyers would not be trusted by the importer, or first holder, but will, as a matter of course, apply to dealers who cannot be so scrupulous in their choice of customers. A brilliant trade may be carried on in this way, so long as the capital of the second-hand wool dealer lasts. His customers are spared much trouble and inconvenience. Instead of having their supply to seek out by patient examina-

tion of stocks from warehouse to warehouse, they have but to wait the solicitation of the second-hand dealer who attends them with his bag of samples, and over the tap-room table of the nearest pot-house they may choose what they like, and order what they list. A manufacturer thus liberally supplied, has his hands free. He needs not depend upon buyers of his goods. He may make consignments of them to New York, to Rio Janeiro, to Barataria; or whether the consignment *Drummer* may point. Some ten or twelve months ago, when the last revulsion took place, it was found that parties had been engaged in preparing for the China trade whom the world would never have suspected of views so extensive. Poor Lord Napier, the "Barbarian Eye," confessed that he knew little of China, except what he had learnt from books; our China traders were wholly innocent, even of book-knowledge—all they knew of China was that it lay somewhere through Hunslet. But the project was ably conceived: Yorkshire cunning and London assurance combined to form the leading establishment which, under the countenance of the promissory note making Bentley, their counsellor, sage, and friend, promised itself the most splendid results. The London buyers were outdone, even upon their own ground. A six months' acceptance, after six months' credit, was held out as most liberal payment. The bubble burst, as all such bubbles will burst. So long as the mercantile community remain passive spectators of such proceedings, and do not set their faces against them, so long may we expect to witness disastrous fluctuations and revulsions.

There is much doing for the China market now, but the business is in very different hands, and has a very different claim to confidence. The general trade of this district, too, continues in a sound state. Our manufacturers have no reason to complain. Recently made goods, which have been got up for service, find ready sale. It is only the old stocks which remain a fixture: goods which were made to suit the purposes of the London buyers, who no longer find imitators or dupes, but are obliged, even themselves, to deviate into honest practices. We have only to take the past as a lesson, and the future is full of promise.—*Leeds*.

**DRILLING.**—The greatest proof of the excellence of Gower's drill, will be found in the patronage which the maker has met with from some of the most eminent Agriculturists. The following is a list of gentlemen in the County of Berkshire who have it in constant use:—Benyon de Beauvoir, Esq. and Smith Englefield; R. Jenkins, Esq. Lucky Park, Oakingham; W. Stone, Esq. Reading; Cap. Scott, Beech-hill; L. Gower, Esq. Bill-hill; Bernard Body, Esq. Shinfield; Love, Bloomfield Hatch Simmons, Abbrorfield; Terry, Spencer's Farm, Maidenhead; Martin and Co., White Waltham; Green, Wargrove, and Co., Clifton; Watling, Warfield; Lovegrove, Maidenhead; Reves, Woobourne; Sparkman, Uffington; Winder, Oakley; Davis, Park Farm, Waltham St. Lawrence; Digby, Dedworth, Glasspool, Bill-hill; Hope, Drill-man Wallingford; Wardley, Drill-man, Wantage; Harvey Drill-man, Lambourn; Nichols, Drill-man, Higworth; Clayton, Drill-man, Hungerford; Petit, Drill-man, Oakley Green-bray; Mr. Druce, Winkfield; Mr. Bartholomew, Chelsey; Mr. Creasy Mortimer, Great Park; Mr. Mathews, Knitbury; Mr. Cooper of Burghfield; Mr. Thompson, Burghfield.

## REVIEW OF THE CORN TRADE IN MARK LANE DURING THE MONTH OF JULY.

At the termination of June and commencement of July, the weather suddenly changed, and cold, heavy rains was experienced throughout England, which in many instances beat down the wheat and barley, and being at the critical period of blooming, would, had they continued, have diminished and injured the crops to a serious extent. The reports regarding the damage committed by the inclemency of the weather, vary materially in their purport, many being the accounts of parties whose opinions are biassed according to their interests, and others from the locality of the ground have had their crops more exposed to the storm, and as is always the case an unprejudiced or impartial statement is very difficult to be obtained. No doubt the weight of the ear of wheat in forward situations, and from the damage the straw has received, that both the quantity and quality of the grain will be deteriorated, and some statements go so far as to compute the loss at from 8 to 10 bushels per acre. It appears however that much of the corn has rallied from its prostrate condition, and with the continuance of fine weather, much of the damage committed will be rectified; from other causes however, the reports of the crops are beginning to wear a less favourable character, the warm sunny days having made the defects of the grain more apparent; the fields to the casual observer present a luxuriant appearance, but on closer inspection the ears generally fail in their triple rows of corn; many have turned off and become a light yellow and are only chaff while some are infected with maggot, red rust and smut, so that the produce, under any circumstances, will be materially affected in comparison to the apparent quantity of straw, and will yield less than last season, though from the superabundance of the growth, we may have nearly an average in quantity, though not in quality. It is on strong lands that the state of the crops has been mostly endangered, as on the lighter soils, the rain was rather beneficial than prejudicial to the corn; while spring corn and pulse have been much improved by the timely supply of moisture, and presents, as far as regards barley and oats, a most bountiful return; though the barley now requires rain, to render the quality kindly.

The faint hopes which existed for either holders or speculators deriving any advantage from their stocks on hand, or by their sustaining much enhancement in value, have on the least appearance of unfavourable circumstances attending the crops of wheat, brought into being numerous conjectures as to the fate of the harvest; indeed these surmises are the peculiar property of the present period of the season, more especially as the depreciation in the currency of the article has rendered it highly unsuceptable of any casualty, which might tend to its improvement. Thus the rains operated powerfully on the minds of some eager speculators, and on the

strength of a predisposition for evil to arise to the grain, transmitted instanter orders abroad which had the effect of raising the prices at most of the leading markets in the Baltic.

The advance at most of country markets in the beginning of the month from 2s to 6s, and an improvement in the currencies in Mark Lane of 3s, and in some instances 5s per qr, created a brisk demand on the part of the millers; speculators also were much more anxious to get into stock. The continuance however of fine weather, and an increase in the supplies from our own coast, particularly towards the close of the month, has thrown a heaviness over the trade, and prices have retrograded in many instances to their previous range with a disinclination on the part of the purchasers to accede to these depressed occurrences. Some sales of low priced bonded wheat have been made for shipment to Maderia, as well as the United States, where the quotations of wheat have rapidly advanced, and remained steady at the improvement, the currencies being noted from 44s to 51s 4d, as the failure in the wheat crops in parts, particularly in Virginia, is to a serious extent,

The supply of Flour the beginning of June having been limited, added to the depressed rates of the article, rendered it equally susceptible of advance with that of wheat, more particularly as the stocks both in the hands of the bakers as well as on the wharfs, were short, Town made qualities advanced 2s per sack, making best descriptions worth 38s to 40s; parcels ex-ship advanced 3s per sack; the decline however which wheat sustained towards the close of the month, and the arrivals increasing, depressed ship qualities again 1s per sack. Bonded American Flour has been much in request, but as the import of the article during later years has been very limited, there is hardly a cask of good sweet quality to be obtained; a few hundred barrels of sour description have found purchasers at 18s to 20s. The re-export however of the article will be to a very moderate extent, as unless the flour can be forwarded to the United States with the Consul's certificate, that it is American produce, and thus rendered free of the Customs Dues of 4s 6d per barrel, the duty will prevent any chance at the present currencies of the shipment turning out advantageously: at Liverpool sour descriptions have obtained 20s and sweet ditto 26s 6d per barrel.

The alterations in the duties consist of a decline of 1s per qr on wheat, making the duty at the close of the month 46s 8d; on barley the duties have advanced 3s per qr, but on beans have receded to the same amount; and on peas the duty has given way 4s 6d, occasioned by the sudden and unexpected enhancement in the Warwickshire averages, which amounted towards the close of July, to 50s 7d on a quantity sold of 300 qrs.

The receipts of barley have continued very moderate, and without the assistance of a few free Foreign parcels, would not have been equivalent to

the demand, which however has been confined to grinding descriptions at an improvement of 1s per qr on the rates at the beginning of the month. The few samples of new barley which have appeared at market have proved *steely* in quality, owing to the want of rain on its coming to maturity, to render it *kindly*; a sample or two of Chevalier has been shown of remarkably fine quality. In Suffolk as well as Norfolk complaints are made of the warmth and dryness of the weather, which are represented as disadvantageous to the barley.

Malt has remained with little variation in value, the principal buyers having been well stocked with the article, the business has been on a limited scale and confined to the finer qualities.

The supply of oats in the beginning of the month, was extremely moderate both from England and Scotland as well as Ireland, and prices advanced fully 1s per qr; but from the 13th to the 18th the Scotch arrivals having unexpectedly increased, with several fresh imports from Ireland, and dealers and consumers limiting the demand to their immediate wants, prices receded fully to the amount of the improvement previously noted, and prices at the close were nearly on a par with those at the commencement of the month. The trade are now becoming fearful of holding stock, under the apprehension that the duty will be lowered sufficiently to admit foreign qualities; indeed there is a decided falling off in the supplies from Ireland and the shipments on their voyage are also very trifling; the advices likewise are confirmatory as to the exhaustion of the stocks in all the principal ports; Scotland is very bare of the article, and importing from Ireland, and our own resources it is well known are too limited to form an item of any importance in meeting the wants of the metropolis and adjacent parts; and basing a calculation on the quantity sold weekly in Mark Lane during the current year, we shall require fully 100,000 qrs of foreign corn to meet the demand of London, before the new crop can be rendered available for the consumption. The amount in bond in London was on the 5th of July 172,000, since which the foreign importations have been weekly increasing. The amount in bond has remained firm in value; good feed being still noted at 13s to 14s, and brew qualities at 16s to 18s. In Ireland prices are very steady and few free on board sales are now offering. At Glasgow Irish oats are realising rather better terms than on our market.

The duty on foreign Beans having declined to 9s 6d, the lowest range it is likely to attain at present, some thousand quarters have been entered and brought upon the market which has forced down the quotations from 3s to 4s per qr, with a heavy sale for the article.

The new white and grey peas which have appeared at market have been of fine quality, and realised at first 40s per qr; the duties however on foreign qualities having declined to 11s towards the close of the month, the trade was rendered extremely heavy at a decline of fully 2s to 3s per qr.

During the month of July, the following quantity of grain and flour has arrived in the port of London.

|              | Wheat. | Barley. | Oats,  |
|--------------|--------|---------|--------|
|              | Qrs.   | Qrs.    | Qrs.   |
| English .... | 35,146 | 891     | 3,506  |
| Scotch ....  | 279    | 367     | 15,580 |
| Irish .....  | 94     | 40      | 49,151 |
| Foreign .... | 560    | 1623    | 19,697 |
|              | Beans. | Peas.   | Flour. |
|              | Qrs.   | Qrs.    | Sacks. |
| English .... | 1,791  | 389     | 24,526 |
| Scotch ....  | 70     | 16      | 6      |
| Irish .....  | —      | —       | 96     |
| Foreign .... | 5,441  | 110     | 1,205  |

In France the harvest has generally commenced, and much of the rye already secured, which is reported of fine quality. Wheat is an abundant crop, but owing to the heavy rains, has been much lodged, and the samples are likely to afford a considerable disparity of quality. Oats will yield, in all probability, a plentiful return. The rapeseed crop is also fine in quality, and the yield satisfactory. On the Rhine the season has been favourable for the blooming of the wheat and rye, both of which promise abundance, but barley, in places where the drought has prevailed, will prove a short crop. The last average price of wheat throughout France, was about 33s 9d per qr. At Paris, the stock of flour being very limited, and the mills, from the want of water, only working two-thirds of their power, prices remained firm; such was also the case at most of the leading country markets, the article bearing a higher relative value than that of wheat. Oats were scarce, and maintaining advanced prices. At Marseille business had been suspended in consequence of the re-appearance of the cholera.

The Italian markets were generally dull; at Naples, the quantity and quality of the new wheat is stated to be good, and prices ruling low; old Barletta is noted as low as 18s, and new deliverable at 21s 7d to 22s. At Genoa, the trade was likewise languid. At Leghorn, though the supply of foreign wheat, from various quarters, had been large, yet the demands of the interior having been extensive, had prevented their increase to any amount. Tuscan white wheat was noted at 42s 6d, and red ditto 31s 2d to 36s 10d. At Trieste prices remained dull, Italian soft wheat being held at 28s. The crops in Sicily were abundant, and wheat likely to recede to 24s 6d per qr.

At Odessa, the produce of the late crop had been received from the interior, and the supplies being considerable, prices had materially receded, and it was expected the best parcels of soft wheat would be bought at 18s 4d; the current rates, however, were 19s 8d to 22s 11d, for soft descriptions, and 22s 4d to 24s 11d, for hard ditto. Rye had also declined much in value.

The demand which had been experienced for rye and meal in the interior of Russia had caused the prices of both articles to advance in the St. Petersburg market, the former article being quoted as high as 26s 8d. Kubanka wheat was nominal at 30s 1d; barley at 20s to 21s. At Riga, rye had given

way in price, and was selling at 25s; best Courland wheat, 27s 7d; linseed was generally firm at the previous currencies. At Danzig, the finer qualities of wheat were much sought after, and prices 1s 6d to 2s per qr higher, owing to the limited supplies; and some demand having arisen for English account, the fine high mixed qualities were held at 32s 6d. The water in the Vistula was so exceedingly low that the transport of grain was much retarded; and in the rivers Bug and Wieprez it was found necessary to have recourse to the expedient of placing the grain in bags on rafts of timber. The weather was showery, but not sufficiently wet to be unfavourable to the crops, except in low marshy situations. In Mecklenburg, the prices of wheat had rather improved, owing to a demand at the beginning of the month on the part of native speculators in consequence of the weather being cold and unsettled, and afterwards in consequence of some purchases for English account, at 23s 6d to 24s. Barley being very short in supply was steady in price, as well as oats. The rapeseed crop had been partially injured by the worm, but the quality was fine, and sales had been made on delivery at 26l to 27l per last. In Holstein and also Denmark wheat has rather improved in value, and quality from the former duchy, weighing 63lbs, was held at 23s 6d to 24s. Oats and barley have both remained steady. The cutting of rapeseed had generally commenced, and the crop was expected to yield better both in quantity and quality than at first anticipated; prices, which had opened at 29l to 30l per last, had become nominal, owing to the falling off in the demand, the principal purchasers from Holland having refrained from giving orders at present, as the crop in their own country was large and prices ruling as low as 28l. At Hamburg, fine wheats were scarce and dearer, and it has been suggested the re-export of wheat from our port to the Elbe, as likely to pay. Fine Silesian, Bohemian, and Danzig white was noted at 32s; Marks, Anhalt, and Magdeburg, as well as Mecklenburg, 26s to 28s. Beans have been in request, and the markets nearly cleared at 23s to 24s. Oats firm.

In Holland no complaints had been heard of the rye or wheat crop. The few samples of new barley which had been received, were, however, thin and light. Rapeseed was a fine crop, and to be purchased at Rotterdam as low as 28l to 29l.

The markets in the United States remain firm for both flour and wheat at improving rates. At New York, Pennsylvanian wheat had obtained 51s 4d; Rye was held at 34s 10d. Jersey and North River Indian corn, sold at 33s to 34s. Flour had advanced 7d per barrel; Western Canal, common brands, obtaining 29s 3d, and fancy ditto, 29s 10d; Howard-street, 30s 4d. At Philadelphia, southern wheat on board the craft, had been bought at 47s 8d to 48s, and on shore, at 48s to 48s 6d; Pennsylvanian was worth 48s 6d to 48s 10d. Rye sold, ex-store, at 95s 6d. Flat Indian corn, 30s 6d to 32s; round, 32s to 33s 4d. About 17,000 bushels of oats had been sold at 18s 4d. Flour had sustained an advance of 1s 2d per barrel; with a brisk demand, prices varying for

scrapped and other qualities from 25s 3d to 27s per barrel, extra, 28s 2d. At Richmond, flour was quoted at 28s 2d per barrel, and at Boston, owing to further speculative movements in the market, and considerable sales for export, the currencies had been enhanced 7d to 1s 2d per barrel; Howard-street obtained from 29s 3d to 30s 4d per barrel; Genesee ditto, 29s 3d. Oats had further improved in value, and were selling at 21s 8d to 22s for prime northern; southern, ditto, 19s 6d to 20s 2d. Indian corn, flat yellow, 32s 4d to 33s; white, 31s 10d; northern round ditto, scarce, at 34s 10d. In the reports from Virginia, it is stated that the farmers hardly ever experienced so gloomy a prospect for the harvest. From the commencement of spring they had hoped that some favourable change in the weather might revive the perishing remains of their crops; but the question is now settled; fields, which in ordinary seasons would bring 20 bushels to the acre, are ploughed up and sown with Indian corn or oats, and many of the most skilful and hitherto successful farmers, are willing to compromise for their seed. A few, a very few, who are peculiarly favoured, may succeed better, but there is now little doubt that a very large portion of the grain growing part of Virginia, will not, upon an average, produce the seed which has been sown. In the most productive portion of the country, 9s a bushel has been offered and refused for seed wheat. The accounts, however, from Pennsylvania are more favourable, and it is thought the grain will turn out about an average crop.

The latest advices also from South America, give a very unfavourable account of wheat crop, which, it was represented, would not yield more than half an average produce.

## FOREIGN.

LONDON, July 23.—The public sales of Colonial and other Wools were continued on Friday and Saturday, and were fully attended; that of Friday consisted of 1232 bales, and was under the management of Messrs. Simes and Co. The demand continued very active up to the conclusion of the sales. Australian Wools at 2s to 2s 8d per lb for the good wools, and some samples marked N. S. L. produced the highest rates during the whole sale, viz. :—from 3s to 3s 5d per lb. The wools in the grease sold at 1s to 1s 3d per lb. The sales of Saturday were small, in all amounting to 440 bales, and the prices obtained were nearly similar to those given at the previous sales. Some Cape Wools sold at 1s 1d to 1s 6d per lb. The correct averages of the whole of the recent sales are as follow :—

NEW SOUTH WALES WOOLS.—Choice flocks 2s 2d to 3s 5d per lb; Average ditto, 1s 10½d to 3s 3d per lb; Good ditto, 1s 8d to 2s 2d per lb; Low and in the grease, 1s 1d to 1s 9d per lb.

VAN DIEMEN'S LAND WOOLS.—Choice flocks, 1s 6d to 2s 6½d per lb; Average ditto, 1s 5d to 2s 2d per lb; Low and in the grease, 10½d to 1s 5d per lb.

A few bales of Cape Wools sold at 11d to 1s 11d per lb.

# THE POLITICAL COMPANION

TO

## THE FARMER'S MAGAZINE.

### ON FREE TRADE IN CORN.

(From the Leeds Intelligencer.)

The speculations of the advocates for a free trade in corn usually hinge upon two main considerations: the saving to the community by a reduction in the price of food, and the advantage which our trade would experience by an extended demand for our manufactures in corn-growing countries. The first of these two pleas possesses the advantage of bearing two very different modes of application, and most cunningly do the political economists avail themselves of the ambiguity in urging its importance in this manner or that, as may best suit their views upon the particular class addressed. The labourer is persuaded that the reduction would all be to his own benefit; that the difference in price would remain in his own pocket, or might be laid out in the purchase of a more plentiful supply of food, or of anything else, for the improvement of his condition. To the manufacturer, however, very different language is held. He is taught that any reduction which can be made in the price of food, will cause a corresponding reduction in wages; that by the free admission of foreign produce the cost of food, and consequently of labour, in England, may be brought down as low as it is on the Continent, and that we may then, but not till then, hope to compete with foreign manufacturers in the markets of the world. It is manifest that both these representations cannot be correct; one of them must be false: and it is probable that they are both false.

Our attention has been called to the subject by the following article which we find in a recent German paper; we need only premise that the "circular" spoken of is intended to show that our consumption of all kinds of grain, which costs us now 75,000,000*l*, might be supplied in Amsterdam for 43,000,000*l*, and in Hamburg for 39,000,000*l*, consequently that the London price is higher by 75 per cent. than in the former, and by 90 per cent. than in the latter place.

"Several of the German papers gave insertion some time since to a commercial circular from Liverpool, attacking the present English Corn laws and showing their prejudicial effect upon England by reference to the present prices of corn on the continent. The "*Organ für Handel und Gewerbe*," which had also published the circular, furnishes the following reply to it:—

"The writer of the report endeavours to show the injustice and impolicy of the existing British Corn Laws even towards England itself, and we will not say that, in this respect, he is altogether wrong, although the subject must be regarded in many different points of view, and much will be found to be said on both sides of the question. But he supports his argument by statements which are altogether superficial, and, in part, utterly fallacious. The writer of the circular calculates twelve million

quarters of wheat at 42*s* 9*d* and forty million quarters of other grain at 25*s* 6*d* as the consumption of Great Britain and Ireland, but he takes as his basis the London average prices only, which are known to be generally the highest of the whole kingdom. The average price of wheat in England was, however, on the 4th March last, not 42*s* 9*d* but only 39*s* 10*d*. The markets of Scotland and Ireland, it is known, are not included in the computation of the average; if they were so, particularly the latter, the average of prices would be placed much lower. It is the same with the other sorts of grain. The comparison made, therefore, is applicable to London only, and that in this, the most populous of all the cities of Europe, the seat of government too, the prices of bread and grain should always be much higher than in other parts of the country, is a thing which explains itself. Abiding, however, even by this most unfavourable element of calculation, how must we regard the bread tax in question, when we find that in England bread itself, or rather meal for baking bread, pays no tax, whilst in Germany more or less of a heavy meal tax is levied throughout. In the Prussian Baltic provinces, where grain is always much lower than in Hamburg or Holland, the average price since the commencement of the present year is about

|                                              | s.        | d. |
|----------------------------------------------|-----------|----|
| 38 six dollars per wispel, which is equal to | 24        | 9  |
| Add the meal tax of 18 dollars per wispel    | 11        | 9  |
| And we get.....                              | 36        | 6  |
|                                              | per Quar. |    |

Which, deducted from the London price of 42*s* 9*d* leaves a difference of 6*s* 3*d* per quarter only. The London consumer, accordingly, would eat bread, not seventy-five and ninety per cent, but only about 14 and two-thirds per cent. dearer than the German consumer on the Prussian coast of the Baltic. Of the relative state of the provincial markets in England, or of those of Scotland, and Ireland, we will say nothing, as these would, for the most part, only tend to show that the consumer in Great Britain and Ireland actually eats cheaper bread than the German consumer! That the English consumer, however generally uses wheat bread, and not the cheaper Rye bread, is a fact which proves the existence of a greater state of prosperity in England, where, through the superiority of that country in trade and industry, over the whole continent, wheat bread is much easier of attainment to the English labourer than even Rye bread is to the German one.

"Let us not deceive ourselves with the belief that a further appeal to the favour of England would open to us her ports for the free introduction of our grain. England considers herself no longer in need of it for the support of her superiority in other respects, and in reality she does not need it except in the event of certain possible contingencies which can always be provided for when they occur, as she pays honestly, that is in sterling, for what she requires. Any concession which she might possibly, but not pro-

bably, be induced to make on this point, would be only as crumbs thrown to the hungry.

Let us now consider the matter in another point of view. As aforesaid the present price of wheat in the neighbourhood of the Baltic is about 24s 9d. per qr, and with expenses free on board about 25s 9d. If, then, England were immediately to open the corn trade, subject to a fixed duty of 10s per quarter, the consequence would be that whilst the price in England would fall at least 10 per cent, it would rise as much on the Continent. The calculation would then stand thus :—

|                                                 |       |
|-------------------------------------------------|-------|
| 25s 9d free on board, with 10 per cent. advance | s. d. |
| amounts to .....                                | 28 4  |
| Freight and charges to England at least .....   | 7 3   |
| Making together .....                           | 35 7  |

At which price the English could purchase our wheat ; but if, in the meantime, the price in England were to fall 10 per cent., or from 39s 10d to 35s 10d the transaction would not repay the English buyer or the German speculator, still less would our farmers receive any encouragement to follow up the experiment of providing for the English market. Any reduction below the present prices on the Baltic, through a series of good crops, would hardly produce a better result, and would always tend to impoverish trade and agriculture. The trade of the Baltic might be somewhat quickened, but the Continent in general would derive little real benefit from it. If England were to open the corn trade entirely, without any duty, which, however, is not to be thought of for a moment, and were to adopt equally liberal principles in reference to the timber trade and other matters, then only might the effect appear somewhat more favourable, but still it would have little real influence in advancing the present progress of industry in Germany.

The writer of the circular is probably a holder of grain 'in bond,' or is, at least, influenced by some such holder, and his wishes are pardonable, only he should have built upon another foundation than the one he has chosen to make his representation pass with the public. It is furthermore certain that every German who feels an interest in the true development of the trade and industry of his country, will cherish other views and wishes than those. England forces us to renounce our former dependence upon her. Why, then, delay any longer to confess the fact and to act upon it ?”

The concluding question is very pretty. Whatever grain the circular-writer may have in bond, we risk little in surmising that his German antagonist has some pet interest also in his eye ; and the amiable tone of feeling which he exhibits towards this country may serve our free-trade advocates as some indication how far their liberal example is likely to be followed by our continental neighbours.

As far as concerns the principle involved, it matters little, we imagine, in what shape a tax upon food may be imposed. The question is, does the foreign workman buy his food, sort for sort, and quality for quality, cheaper than the English workman ? On this point, we apprehend, there is much popular delusion, and the above article throws some light upon it. We noticed a few days ago that the price of the 4lb loaf in Paris was quoted at 11½ sous, about 5½d., and the price of the best bread in the bakers' shops here is only about the same. The relative cost of living in the two countries is an entirely different matter, and the statement of the German writer on this point is strictly correct. The German workman does not

fare so well as the English workman, and he must necessarily live cheaper. But their modes of living do not differ more than their characters and capacities—the German has none of the energy, the intelligence, the persevering industry, the unceasing, systematic application which are all so conspicuous in the English labouring classes ; and if he were to acquire these qualities, he would at the same time acquire an elevated sense of his own importance, together with that desire for improving his condition which would speedily put him on a level with the English workman in point of comfort and enjoyment.

Until such a result be produced, however, it is in vain to look for anything like equality in the cost of living in the two countries. There is at all events but one alternative :—if the German will not live as well as the English workman, the latter must lower himself to the habits of the former. The doctrines of the “coarser sort of food” and the “herring soup” philanthropists would in that case be of eminent practical utility, according to *their* notions in such matters.

## POOR LAWS—IRELAND.

(From the Herald.)

The absolute necessity for the adoption of a system of poor laws for Ireland is so obvious that we should be astonished at the fact that the Legislature is so slow to approach the subject were it not equally obvious that in this instance the interests of the Irish Legislators and of the Irish people are wholly at variance. It is to be expected that the Irish Aristocracy should seek to keep their properties untouched, even though they should by so doing send thousands and tens of thousands to the grave—victims to absolute famine in the midst of plenty. Any other course would be inconsistent with the “even tenor of their way,” but is it wise on their part to allow those who are in their own conduct, and in the management of their estates, the most conspicuous illustrators of all the miseries to which the peasantry of that country are subjected, to appear in the van as advocates against a system of poor law—the only bar which can now be flung between the ruthless oppression of the landed Aristocracy and the absolute starvation of the people of Ireland ! Is it wise that the Earl of Limerick should be the man to oppose such a measure ? Has the noble earl no sense of the lesson which he is by such a course reading to the people ? Is it wise to instruct the people that they must starve because their preservation from famine would lessen the revenues of the Earl of Limerick and of the other landed proprietors, who, being Legislators, will legislate for themselves ? Is it right or proper to hold up such a conspicuous proof that the interests of property and of labour are at variance. These are questions which it would be well if the Earl of Limerick would think on before he again opposes himself to the last refuge of a starving people. The noble earl talked of poor laws being mischievous, because calculated to dry up the sources of private charity, which he described as being great in that country, and he spoke too from an avowed knowledge of it from many years' residence. Without stopping to inquire whether that residence was not prior to 1800, we will ask what the noble earl himself has done in aid of the charity of those who vainly seek to mitigate the terrible lot of suffering humanity in Ireland. We have still fresh in our recollection the statements transmitted to us by our correspondent, who, during the autumn of last year,

took singular pains to ascertain the state of the poor of Ireland, and from those statements we can affirm that the Earl of Limerick has an advantage beyond that of any or all of his compeers in the British Senate. In the whole British empire there is not a man who has upon his own estate so wide a field for the exercise of the best attributes of our nature—so inexhaustible a supply of the worst and most appalling scenes of human misery upon which to exercise the benevolence of his own. Will it be credited by those who see the Earl of Limerick thus opposing himself to the adoption of poor laws for Ireland, that in the city from which he takes his title—nay, that in one parish of that city, in and around which the great bulk of his property is situated, there are between 6,000 and 7,000 people in a state of starvation! We are wrong, perhaps, in saying there are those numbers, for doubtless, long ere this, the system has done its worst for them, and they have passed away to swell the list of victims to the heartless landed Aristocracy of Ireland. We may, however, take it for granted, that their places have been supplied, and that there may still be seen upon the property of the noble earl the same scenes our correspondent witnessed last autumn. Wretches starving and naked—positively naked, in empty and falling houses (for which they nevertheless paid rents out of the profits of their beggary—some 2d others 3d, and some 4d per week, without fire or food, lying upon rotten straw—the only furniture of the rooms, except in one instance, in which he perceived a large stone that appeared to serve for a seat. There he beheld people dying around him, whether from cold or hunger, it was difficult to say, so appalling was the want of food and raiment. Unable to move, aged people lay upon little heaps of mouldering straw, their only hope of supporting existence for another day being the success of some beggar who might be fortunate enough to get a potatoe more than he could himself devour. But worse even than this—the wretches who are thus famished must lie where their horrible death has overtaken them, until their half-putrid corpses send forth pestilence to the survivors. There is no public or parish fund to bury them, or if there be the matter is neglected, and a most benevolent gentleman, who exerted himself deeply to mitigate the sufferings of the people, finding no other remedy for this evil, has been obliged to tell the unfortunate wretches to expose the bodies of the dead, at nights to lay them in the public streets because then somebody must see to their burial. It is very true for the Earl of LIMERICK that charity prevails to a great extent in Ireland, and it is equally true that the feelings of kindred goes far to lessen the number who must otherwise swell the catalogue of misery; but what does this argument amount to? Does the Noble Earl himself subscribe liberally to the relief of the poor? Does he, in fact, subscribe a single 10l in the year to the aid of any or all of the charitable institutions of Limerick?—we would ask the Noble Earl, if by taking advantage of the competition for land in Ireland, the landlords let their estates at a rental which the whole produce will scarcely pay, and then sell the produce to England to pay that rental, leaving nothing to the peasant for his labour; we would ask him if, by such a course they starve the peasantry, by what right do they fling the support of that peasantry upon those who have, it appears more charity than themselves? If the landlords should have supported those people out of the produce of the soil, and, instead of doing so have driven them to beg for charity it is my Lord the Earl of LIMERICK, *et hoc genus omne*, who are really the receivers of the charity thus given.

They are the beggars, and not the wretches to whom it is in the first instance given. When we find such persons standing up in the Legislature to oppose a relief to the poor, as it is called, but, in reality, a measure to save them from famine, and their oppressors from further crime, we think it our duty to show that, whether actuated by self-interest, or not, at all events self interest is there to actuate. It might be as well for those who are opposed to the introduction of poor laws to select for their advocates gentlemen whose estates present a less harrowing spectacle than is afforded by the Limerick and Bruff estates of the Earl of LIMERICK; and to the House of Peers we would only say, "Instead of listening to the Noble Earl, look to his estates: and if one glance does not convince you of the necessity of poor laws for Ireland, nothing that can be said in Parliament will ever bring you to that conclusion."

### THE PEERS AND THE DISSENTERS.

(From the *Courier*.)

The division on the Earl of Radnor's motion the evening before last seems to demonstrate that three-fourths of the peers are hostile to the dissenters. We are grieved at the decision on account of the peers, who, by such votes, give rise to the suspicion that they pay more regard to their own feeling as members of a particular church or sect, than to the public welfare; and on account of the Universities, which are thus nakedly and ostentatiously proclaimed to the world as institutions exclusively intended for one sect and one party, and as not national institutions. If, like the cotton manufacture or the trade of Russia, they arose and existed independently of the legislature, we could not make one objection to their benefits being confined to those among whom they originated. But, with the exception of the reputation of their members, and with the exception of the revenues derived from teaching, the Universities wholly exist by favour of the legislature, which represents the whole people. It is beyond the power of this body to destroy the cotton trade, but it might, by taking from the Universities the tithes of Kirkham, of Havering-atte-Bower, &c., and by a mere different regulation as to church patronage, put an end to the Universities to-morrow. Just, however, as these bodies are exclusive and confined to one sect, just in that proportion does there arise in the legislature, which represents all the people, strong motives of hostility to the exclusive body. As their basis is narrowed their wealth makes them top-heavy, and may bring about their fall. By allowing them to extend their roots among all sects and all classes they would soon become entwined with every part of the community, all would have an interest in upholding them, and the general attachment would give, if anything could to a work of man, a permanent duration to institutions which now seem tottering to their fall.

The present fate of the municipal corporations, it occurs to us, ought to be a warning to the defenders of the exclusive system. In the number of the *Quarterly Review* just published, an elaborate eulogy is passed on our old corporations. "They were the chief agents," it is said, "and subsequently the safest depositories of the private rights and public liberties of Englishmen. They had for ages presented an elastic but effectual resistance to the encroachments of the populace on the one hand, or the Crown on the other." Yet these invaluable qualities—these endearing recollections—these much superior claims to any which

the ecclesiastical corporations can boast of—to the gratitude and affection of the people, has not saved them from being “swept away almost without opposition and complaint.” And what has swept them away? Has the hostility of the excluded dissenters had no influence over their fate? We beg to call the attention of the Archbishop of Canterbury and his brethren to the remarks of the reviewer. There is much wisdom in them, though he has not drawn from them the instruction with which they teem. The reviewer shows that most of the commissioners for inquiring into the corporations were Dissenters, and it was their hostility caused by the test laws, which, down to 1828, excluded them from all the corporations of the kingdom—it was their re-active prejudices, “to be traced in every page of the report,” which have led to the “sweeping away of those ancient corporations.” What an important fact is this for the contemplation of those who persist in pursuing, as to the Universities, the very same conduct which, as to the corporations, has exasperated the Dissenters, and caused, according to the reviewer, the destruction of those time-honoured institutions. Undoubtedly the Dissenters of all kinds are increasing in number, wealth, and power; and undoubtedly nothing can be so dangerous to the Universities as to excite against them the hostility of a powerful body, instead of winning its support.

#### DISTRESS IN IRELAND.

(From the Courier of July 8.)

Mr. Crawford is to-night to make a motion relative to the distress, or rather, we should say, famine, that now unhappily prevails in the county of Mayo and other parts of the west of Ireland. The gentry of the province ought themselves to have come forward to meet the urgency of the crisis; but if they will not interfere, we apprehend government will be obliged to devise some temporary remedy.

But whatever may be done in the meantime, we trust that no long period will be allowed to elapse till measures be taken for protecting the poor from the like extremities in future, and for compelling the landlords to attend to something else in the management of their estates, besides enforcing the payment of exorbitant rents. For some time past an opinion has been gaining ground in certain quarters in England, that the condition of the people of Ireland has begun materially to improve; and that consequently it would be wrong to interfere, by introducing a compulsory provision, or otherwise, with this natural progress to a better order of things. This notion is founded chiefly on the increasing amount of the exports of corn and other raw products from Ireland, which affords, it is said, a clear proof of the increasing industry of the inhabitants and of the prosperity of the country. But the facts do not bear out any such inferences. There is no doubt as to the wonderful increase in the exports of corn; but the question is, how has this increase been brought about? Has it been accomplished by the improvement of agriculture and the consolidation of small occupancies, or is it a consequence of the breaking up of old pasture land, and of the extension of that small farming system that is the bane and curse of Ireland? In some districts it may be owing to the operation of the former class of circumstances, but, generally speaking, this is not the case. The principal increase in the exports of produce of late years has been from Connaught—from the very seat of the present distress; and there is the most unquestionable evidence to show, that the process of

splitting land and multiplying beggars, has been going on more rapidly of late years in that province, than at any former period. The *con-acre* system prevails at this moment in every part of Connaught. This is the name given to a practice followed by the landlords and larger class of farmers of letting small slips of land at the exorbitant rent of from 7*l* to 12*l*, and even 14*l* an acre, for one or more seasons, to the adjoining cottiers, giving them liberty to take from it crops of corn, potatoes, flax, &c. It is usual when *con-acre* land is broken up from grass, to allow it to be *pared and burned*; and so rapidly is this most pernicious of all practices extending, that a very intelligent witness, Thomas S. Linsay, Esq., informed the agricultural committee of 1833, that when he left Mayo the *entire county seemed as if it were on fire*; and he was sure he did not exaggerate when he stated that a *fifth part of the surface was actually in a flame*! The savages described by Montesquieu cut down the tree to get at the fruit; but the landlords of Ireland go a step further, and to obtain more rent burn the very soil! The Legislature has attempted in vain to restrain their cupidity, by prohibiting this villainous practice under a heavy penalty; but the act is a dead letter, and its existence is not, in fact, known to almost any one. Surely, however, none will pretend to say that the increasing exports of corn from Galway, Sligo, &c., resulting, as they undoubtedly do, from the extension of such a system as this, are any evidence of increasing prosperity! The cottiers sell everything they can contrive to raise by these *con-acres* and otherwise, except potatoes; and when these happen to fail, as in the present instance, they have nothing for it but to die in the ditch, or to seize (should they be lucky enough to fall in with such a thing) on the property of others! It is a good deal worse than absurd to talk about the improvement or the tranquillity of any country where such practices are permitted to strike their roots and scatter their seeds on all sides. There is, however, but one way of arresting their progress, and that is by making the landlords responsible for the subsistence of every individual they allow to settle on or to occupy any part of their estates. Nothing short of this will be of the least use. The landlords of Ireland are, perhaps, not worse than those of other countries; but, however this may be, they have proved that they are insensible to all considerations save those of the pocket. *Quocunque modo rem* is a maxim they religiously observe. They have not scrupled, for the sake of additional rents, to allow some of the finest estates in the world to be split down into mere potato gardens, occupied only by beggars; and when it suits their views, they have as little hesitation in retracing their steps, and ejecting the wretches, they have, in a manner, called into existence. It is in vain telling them that this system is destructive alike of their own real interests and of those of the country. The vast majority look only to immediate consequences, to the immense rents that are promised them, and to nothing further. It is, therefore, indispensable that the legislature should interfere and enforce a compulsory provision for the support of the poor and the destitute. Let this be done and the splitting of farms and burning of land will no more be heard of—neither will poor wretches be turned out of their huts with no alternative save robbery or death. The landlords will then be obliged to treat them as men, and not as noxious vermin; and when they wish to get rid of their cottiers will have to carry them to Canada or elsewhere. We look upon some measure of this sort as the one thing needful in the case of Ireland. With it other measures may be of use—without it they can be of none whatever.—Members of the House of Commons may amuse them-

selves in declaiming by the hour on the evils of tithe, Popery, agitation, and so forth; but the real evil of Ireland is the *destitution of the poor*, and till that be set to rights honourable gentlemen would be quite as profitably employed in whistling jigs to milestones as in devising schemes for the cultivation of the bogs, or in recommending the practice of forbearance, industry, frugality, and the other virtues.

### IMMIGRATION OF LABOURERS.

(*From the Manchester Guardian.*)

In the month of March last, we gave some particulars of the removal into this neighbourhood of several poor families from the parish of Great Bledlow, in Buckinghamshire, where severe distress had prevailed amongst the agricultural labourers, and of the great improvement in their condition. About a month afterwards, we inserted a letter from the Rev. James Beard, rector of Cranfield, in Bedfordshire, who stated that the labourers in his parish were in great distress from the want of employment and the low rate of wages; and he expressed a wish to make an arrangement with some manufacturer in this neighbourhood for receiving and giving employment to a few families from Cranfield. We have this week had the pleasure of an interview with Mr. Beard, and are glad to find that his benevolent intentions have been to some extent carried into effect, with a success quite equal to that which attended the removals from Great Bledlow. The parties that left Cranfield were twelve married men and their families, who were sent to Mellor, in Derbyshire, and have been for several weeks past employed at Mr. Clayton's factory there. Mr. Beard, being desirous of ascertaining how the change had operated upon his late parishioners, has just paid them a visit, and has had an opportunity of learning from their own lips, and from an inspection of their dwellings, to what extent their condition has been improved. We are happy to be able to state, that, in every case, the removal has been attended with the most satisfactory results. They all continue in the service of Mr. Clayton—are all (with their families) earning wages to an amount about three times as large as they could have obtained at Cranfield—and are all extremely well satisfied with the change in their condition, as, we believe, their employer is with them. We are glad to learn, too, that they have been treated with great kindness by the people of the neighbourhood in which they have come to reside, who have shown no symptoms of that sort of jealousy of the new comers which designing men have endeavoured to excite in the minds of the working population of this neighbourhood—a result to which the mild and bland manners by which the peasantry of the south of England are distinguished has no doubt materially contributed. Mr. Beard informs us that the population of his parish is about 1,200, and that amongst these there are a number of other families of most industrious habits and irreproachable character, for whom also he is desirous of obtaining employment in this neighbourhood. They have long been, owing, as we have said, to the depression of wages in agricultural employments, in a state of great distress; but they have borne their sufferings with the utmost fortitude and resignation, a circumstance which has greatly stimulated his anxiety to serve them, and which cannot be better illustrated than by the fact, of which he assures us, that not one of his parishioners has been convicted of a

criminal offence for the last three years. We look to the wide field for labour which these manufacturing districts afford as a most valuable auxiliary with the new poor laws in improving the condition, and thereby re-elevating the character of the agricultural population of the central and southern counties; and we hope the migration of a considerable body of the labouring classes from thence will have considerable effect in softening the manners and refining the habits and feelings of our own operatives. It will be thought extraordinary that any system-mongers (for we will not attribute the thing to a worse class of persons) should have carried their opposition to the voluntary change of residence, on the part of individuals, with a view of improving their condition, to such a length as to have placarded the agricultural districts with bills representing those labourers, who consent to come into this neighbourhood, as being transported to slavery. Such, however, Mr. Beard informs us has been the case, and he showed us a letter from one of Mr. Clayton's men to his friend at home, which adverts to the fact. Speaking of some acquaintances, "Tell them," says the writer to his correspondent, "that we are not transported, and that we are not slaves;" and he added something to the effect, if we recollect aright, that those who would not believe him might stay and be slaves (for 't'ey were no better) at home. It gives us pleasure to record the success in this way of another effort to improve the condition of a laborious and deserving class; and we trust that what we have now written may pave the way to further successful experiments of the same kind.

### POOR LAWS—IRELAND.

(*From the Herald.*)

In another column will be found an abstract of the bill introduced into the House of Commons by Mr. G. Poulett Scrope for the relief of the poor of Ireland. The question of the second reading is fixed for Wednesday next. It would be difficult to select a more thankless office than that of legislating for the poor in Ireland in the present state of opinion with regard to poor laws in those quarters which are most likely to be influential with the Legislature, and even with the people themselves. The Irish landlords are, generally speaking, against a compulsory provision. Mr. O'Connell is against it and for it. He is against it in his speeches, and for it in his votes, but his speeches are of much more importance than his votes, for the former produce an influence upon thousands of his countrymen, while the latter is a mere isolated individual act, deprived of all influence, except its weight in the division, by the counter-acting force of the observations which more than neutralize its efficacy. Under such circumstances it is, we repeat, a thankless office to legislate for the poor of Ireland, and perhaps some portion of the reluctance manifested by government itself may be ascribed to the same apprehension. But all this only adds to the merit of such men as Mr. Scrope, who persist under such circumstances in using their humane endeavours to prevent famine from continuing to be the epidemic disease of that country. Mr. Scrope's bill aims at introducing into Ireland the principles of the poor law of Elizabeth, through the machinery of the Poor Law Amendment Act of last session. But the bastardy clauses are omitted, and the workhouse system is omitted, and in lieu of that system is substituted employment upon public works and home coloniza-

tion, with the ultimate resource of emigration, in cases which may call for such a remedy. It is evident, therefore, that an attempt has been made in this bill to avoid the most objectionable parts of the poor law machinery, a machinery to which we feel such strong objections ourselves, that we will own we were startled at the first view to see it extended under any modification to Ireland. To the adoption of the principles of the poor law of Elizabeth we apprehend there will be but little objection amongst those who admit the necessity of a compulsory provision. It is a delusion to expect that anything short of that can be permanently beneficial, or even for the time effective to any considerable extent. Talk as they will of the danger to property under such a law, it is nothing to the danger, coupled with disgrace, of allowing multitudes to perish, or pretend to save them by the mockery of temporising expedients. Ireland has tried the "voluntary principle" of relief long enough, and it has failed. Compulsion, however disagreeable, however unsentimental it may sound, must be resorted to, for this plain reason, that there is no other way of apportioning the relief to the wants of the people, or of equalising the burden upon those who ought to contribute, but by compelling all such to do so. It may be natural enough for the Irish landlords, who have never paid a single sixpence in poor rates, to think that they will be so much the worse off for every sixpence they are called upon to pay—to think that every successive demand will be so much out of their pockets without the prospect of any return. But however natural it may be, we cannot help considering this a very short-sighted view of the question. Tranquillity alone would be tantamount to capital in Ireland. It would act as a stimulus to improvement by removing the great pressure which has long kept it down. Public works and home colonization would do much as parts of the new system, but little or nothing of themselves. The landlords must be roused to activity. They must be shown and forced to see that it is their interest to provide employment for the labouring classes, that they have duties to perform as well as rights to exercise, and rents to squeeze out of indigence and suffering. We cannot, however, expect, after what has already passed on this subject in parliament, during the present session, that anything will be done in the way of direct legislation. The excuse of the commission of inquiry is still as strong, and will be as strong on Wednesday next, as it was a week or two ago. But it is one good symptom for the cause, that such motions, instead of being scouted, follow fast upon each others' heels, and that the necessity of taking some step, is now so far admitted, that the opponents of poor laws are driven to act upon the defensive. We trust that, as they cannot long find excuses for delay, they will yield with a good grace to the growing opinion of the country, and the frightful evidence of distress upon which that opinion is founded.

#### THE IRISH CHURCH.

(From the *Morning Herald*.)

We are happy to observe, from the notice given by Lord Stanley, last night, with reference to the Irish Church Bill, that his lordship is not to be driven from his purpose of resisting the meditated plunder of ecclesiastical property, under the gentle name of appropriation. In the notice to which we allude Lord Stanley has pledged himself

to bring forward a direct proposition, asserting the right of the Church to its own funds—that is, to the funds which have always confessedly belonged to the Church until now that, for the first time, the State puts in its claim, just as a pickpocket puts in his claim to a pocket handkerchief, by an act of appropriation. It is upon this clause that the grand struggle will take place, for it requires no great sagacity to foretell that if the principle of seizing, upon any pretext, however plausible, the revenues of the Church be once established, the hand of aggression will not stop there. Those who take out of one pocket will take out of another; those who relieve the Church of its superfluity will not abandon individuals to the serious responsibility of possessing more than their wants require. If Lord Stanley should fail in his endeavour to remove what has been justly called the spoliation clause, the institution of property will be shaken to its base, the great purpose of all civilized government will be subverted, and, though the process may not be instantaneous, it will come at last to the breaking up of social order, as a necessary consequence of the dissolution of property. It well becomes Lord Stanley, who has proved himself a bold reformer by supporting the Reform Bill throughout the whole of its difficult progress, to stand firm in his resistance to such a clause as is now attempted to be carried, under the pretence of improving the condition of the Irish Church. That his popularity may—nay, that it must suffer for the moment, we need not be told. In fact, he has already experienced it. The tone of the ministerial journals, and the conduct of the ministerial and Radical members in the house have apprised him long since that real patriotism is capable of being misrepresented. But the time will come when his country will do justice to his motives. The very rancour with which he is followed at present is a proof of the importance which his political enemies attach to the part he is acting. If, happily for the country, he should succeed in the attempt he is now making, the gratitude of the nation will at no distant period reward him for the obloquy he has encountered for the sake of principle. Even if he should fail he will have the testimony of his own approving conscience, and the concurrent applause of all those who distinguish between the change of improvement and that of revolution and destruction. Professing ourselves of that number, we tender him our thanks for the attempt in which he is engaged, and heartily wish him success.

#### POOR LAWS—IRELAND.

(From the *Globe*.)

There is gratifying evidence of decided progress in rational views on the subject of the measures to be taken for the relief and the employment of the poor in Ireland. It is fortunate that this question had not come to a head before a vigorous essay at reformation was made in the English poor laws. The ignorant superstition which suggests the delusion, that the way to get rid of a loathsome disease is to give it to another, would have inclined those who are writhing themselves under the plague of pauperism to imagine they should lighten their own by imposing similar burthens on others. The beginning, however, which has been made in the work of poor law reform in England affords at least security that whatever measures are taken in Ireland will be taken in conformity with the improved views adopted at home.

We are not, however, satisfied with this partial security against the application of measures unsuited to the condition of Ireland. It must not be forgotten in how many of its provisions the amended English poor law, at best, merely repairs and corrects the deep-rooted abuses of an old system. The fundamental difference, besides, in the state of the two countries, with reference to the operation of the poor laws, is, that in England cases requiring relief, at worst, are the exception; in Ireland they are too often the rule. Two-thirds of the population of England are engaged in those branches of skilled industry which extort subsistence, for those who follow them, from the acquired and artificial wants of their customers at home and abroad. Whereas the mass of the Irish people have no resource but the rudest husbandry. They can dig—that is all—and to beg they are not ashamed. Almost the whole population, therefore, may be reckoned as redundant, except those actually required to cultivate the soil; and in calling a population redundant, we beg to be understood to mean that they neither can feed themselves, nor make it worth any one's while to feed them.

This state of things, in a lively and quick population like the Irish, can have no other origin than misgovernment. It is idle and silly to lay the whole blame on the absentee landlords. Landlords, doubtless, can do a good deal; but they think too much of their own importance if they fancy that their presence or absence makes all the mighty difference of condition betwixt England and Ireland. It is quite possible for resident landlords to do greatly more harm than good; their game-keeping crusades, their unpaid justice, their importation of London lackies and levities into the rural districts—these are little set-offs, in too many cases, to the local circulation of wealth occasioned by their presence. Some of the most contented and best cultivated districts, both in England and Scotland, seldom see the face of their landlords. It is quite ridiculous, also, to talk of the absence of landlords, and want of poor laws, as if these had been the active causes of Irish misery from the beginning. Ireland was systematically gagged and handcuffed for centuries; her tongue silenced from speaking her wants, her hands tied from exercising those branches of industry for which her situation gave her every advantage. English religion proscribed Irish—English commerce prohibited Irish—and, after ages of this discipline, English poor laws are to redeem the whole degradation and barbarism caused by it. Pshaw!

#### THE IRISH CHURCH.—APPROPRIATION CLAUSE.

(From the Times, June 24, 1833.)

"The vote of the House of Commons on Friday evening, whereby the 147th clause of the Irish (Church) Temporalities Bill was expunged, we consider a lamentable circumstance. It must be recollected, and indeed was recalled to mind by more than one Member in the course of the discussion, that Ministers had, on first introducing the Coercion Bill, declared their determination to resign if they could not carry the Church Reform Bills, as well as the Bill of Coercion. This was a pledge, and a pledge the more sacred, because it held out to adverse parties a condition, which in reliance on the good faith of Government, those adverse parties have fulfilled. The Coercion Bill, we repeat, was supported

by many of those who would otherwise have opposed it, in full confidence that the Bills of conciliation in relation to Church affairs would have been carried also, and neither sold nor compromised. For some time previous to Friday's vote, rumours had been in circulation, and the matter of them was announced in this journal, that the Tories in the House of Lords, impatient at their exclusion from office, had decided on the immediate overthrow of Ministers, which was to be effected by that of the Irish Church Bill. A hostile vote of the Peers was therefore ordained, and a consequent resignation of Lord Grey's Ministry was reckoned on.

The question therefore for his Majesty's Government was, whether they should maintain their Church Reform Bill intact in the House of Commons, where they were powerful, leaving upon the Tory Peers the responsibility of rejecting it elsewhere, and so disgusting the country; or whether they should submit to be beaten without fighting on that field where they had the victory already in their own hands, and under the name of a 'compromise for the sake of peace,' yield to their enemies what they would take care to represent as a signal triumph.

"The latter branch of the alternative was that which the Ministers, we think unfortunately, believed themselves justified in accepting. They made what they deemed was a compromise, but what the Conservatives loudly boast of as a complete surrender of the whole point in dispute—viz. the 'inalienable nature of Church property.'

"The 147th clause of the Bill contained a provision that any surplus, arising from the conversion by purchase of Bishop's twenty-one-year leases into perpetuities, should, after securing certain ecclesiastical objects formerly provided for by the vestry-cess, be 'applied to such purposes as Parliament shall hereafter appoint and direct.'

"Apart from the special pleading on the subject, Mr. Stanley, by giving up the clause, has given up, in fact, the assertion of the original and fundamental principal of all Church Reform; namely, the power of dealing, according to the supreme will of Parliament, with any and every portion of that property which the state had itself originally appropriated to the temporal uses of its religious establishment. The recognition of this principle was essential to the legitimacy of any measure of temporal Church Reform. It is that without which not even a commutation of tithes, or a charge for poor-rates, or a property tax on the the tithe owner, can be rendered valid. If there was not an Irish Protestant layman from north to south of the island to-morrow, the temporalities of the superfluous Church could not be touched by Parliament without a declaration of the one great datum, that 'Church property is disposable by the State.' And this is the ground which Ministers have abandoned; and, upon their own showing, what does their inducement amount to?

"Says Mr. Stanley, 'There may be no surplus whatever; why, therefore, prematurely regulate its application?'

"To this we answer, that although the proposal for a tax on existing incumbents has been withdrawn with the general assent of the House, there still remains, besides the income of the suppressed bishopricks, the whole fund to accrue from the conversion of terminable bishops' leases into perpetuities. Such conversion is authorised by the Bill, the manner of it is prescribed, and its results are minutely calculated and provided for by several successive clauses. Is it not, therefore, mere trifling with the country to tell us that because there is no fund in hand at the present moment, save only what proceeds from a reduction in one bishop's income, and from the

suppression of another, yet that the fund, prospective and eventually certain, which must, in the nature of things, arise from an extensive, if not universal, buying up of the bishops' leases in perpetuity, is no way worthy of being taken into account by Parliament, but is to be treated as a pure abstraction, and left to the chances of future, or merely possible legislation?

"Mr. Stanley avows, however, that Ministers have given way on this occasion as a peace offering to the Tory Lords, to avoid a 'collision of which all must deplore the consequences.' But why that collision? If Mr. Stanley's statement of the case be true he has sacrificed nothing whatever to the Tory Lords—literally nothing—because in his opinion the assertion of a naked principle is not worth contending for. Then let us ask the Right Honourable Gentleman whence could arise a collision with the other House of Parliament? What materials are there for a contest? If the thing be not worth a single straw, why should the Lords insist on it in such case? or, if the principle be just in itself, why is it the government in the House of Commons that should give way, and the enemy that should have cause to sing *Te Deum* for a victory?

"The truth is, that the Conservative Party do not so undervalue the immense importance of that night's proceeding. Their organs of the press, and of society, boast and exult in the degradation thus inflicted upon Ministers. Describing them as men whom their adversaries need not fear, and whom their friends are unable to confide in. Look over the division of this unlucky evening, and you will see the Government opposed by its friends and pushed forward only by its enemies. Mr. Grote, in his manly impressive, and upright speech, condensed into few words the merits and bearings of the question. According to the Member for London, the Bill even in its original frame, had been scarcely efficient for the purpose of bringing within just dimensions the Church of Ireland—"that great ecclesiastical enormity of Europe." But, robbed of its most significant clauses, instead of voting silently against it, he would give the Bill his most decided opposition. He added, that the whole professed principle of the Bill was negated by the erasure of that single clause; that the House of Commons would be no worse by sending up the Bill to the House of Lords, and letting their Lordships have the merit of rejecting it; that, for aught Ministers knew, the Lords might beat them on other clauses, and that, if he might advise Ministers, it would be to adapt their measures to the wants of the people, and leave the other House of Parliament to act as they thought fit.' This was high and honourable counsel, too bold and straightforward, we fear, to be implicitly followed.

"In grief, not in anger, and certainly not in enmity, we repeat, that the surrender of Friday night was a loss of character, that is, of substantial power. The Tories conciliated by it? why, they laughed at it publicly. They are stimulated by it to the imposition of fresh burdens and humiliations upon their weakened foes. Besides, the sacrifices of the Government cannot end here; they are but beginning, and thankless as well as disreputable will be each step in the descent. Between the Conservatives and the English nation, where can Ministers make a stand, after the demonstration of a spirit so irresolute? Without gaining over a single friend from the Tories, the whole body of sound Reformers are affronted at this desertion of the common cause. The principle thus abandoned was worth all the rest of the measure. It was one, the steady adherence to which would have inspired the people almost uni-

versally with confidence in the firmness and wisdom of the King's Ministers, and would have filled the Tories with corresponding consternation. Ministers, with King and People at their back, might smile with scorn at an isolated and odious faction; but alienate the people from them, and let his Majesty once distrust their manhood, and what have the Tories to fear?"

#### FAGGOT VOTES.

(From the Courier.)

The Opposition Journals, especially the *Standard*, *Age*, *John Bull*, and *Northampton Herald*, have recently made repeated attacks on the Duke of Bedford, for resorting to manœuvres in order to manufacture votes for his dependents, and especially for having created forty votes out of a forty acre field at Hartford, in the vicinity of Huntingdon, with a view by such means to reinstate Lord John Russell in the representation of Huntingdonshire. We have, therefore, made inquiry in proper quarters, incapable of deceiving us, and we are enabled decidedly to state that there is not the slightest foundation for the charges. We give them the most positive contradiction.

The Duke of Bedford has no property whatever in the parish of Hartford, in the county of Huntingdon, and has never divided any field in that or in any other county, for the purpose of splitting votes.

Several years before the Reform Bill was proposed, at a time when Lord John Russell was a candidate for Huntingdonshire, some of his friends in Bedfordshire, including several of the Duke of Bedford's tenants, purchased a farm in Huntingdonshire, with the intention of supporting Lord John Russell; but this was their own spontaneous act, altogether unknown at the time to the Duke of Bedford.

Instances of similar proceedings occurred all over the country, and there is obviously no reason why Lord John Russell's friends, anxious for his election, should not have availed themselves of the means allowed by law, to support Lord John—they having the same means to which his opponents resorted to oppose him. The practice was general all over the country.

---

GROUSE SHOOTING.—The 12th of August is at hand, and the Sportsman who contemplates a trip to the moors, must already have commenced preparations. After having exercised his skill and judgment upon the more essential points, his dog and gun, the next matter which invites his attention is personal comfort. To promote this there is nothing more important than dress of proper materials. Formerly the fatigue of mounting hill and crossing moor, was in no small degree increased by the weight of a thick heavy velvet jacket, but here too the "march of intellect" has stepped in, and a Gambroon Jacket is now substituted for the antique velvet one. Were it in our power to indulge in an excursion to the North, there is no sporting dress we have ever met with, which, whether as regards lightness and imperviousness to rain, without confining perspiration, at all equals that which we have seen at Messrs. DOUDNEY and SONS, Lombard-street. Equipped in one of Doudney's Gambroon Jackets, his shooting, waistcoat, and long tanned-leather gaiters, the Sportsman may defy the effect of sun, fog, or rain and that, too, at a most moderate charge.

# THE FARMER'S MAGAZINE.

SEPTEMBER, 1835.

No. 3.]

[VOL. III.

## TO THE EDITOR OF THE "FARMER'S MAGAZINE."

SIR,—Since I wrote my last letter the harvest has so far advanced that a much better opportunity has been afforded to judge of the crops than at that time. The report I then gave of the prospect of the different crops in this county, will, I believe, on the whole, prove to be pretty correct, although there are many persons who still think that the wheat crop will not exceed an average growth. The weather here for the harvest has been most favorable: not a single hour has been lost from wet, and a few more fine days will see the whole of the corn secured, and when this is accomplished the great necessity which exists for rain will be more fully apparent. At this season of the year (the middle of August) I have never known the provision of food so deplorably short as at the present time, and how the sheep are to be kept through the winter is to me a perfect mystery, for it is now morally impossible that the turnip can afford any thing like a fair proportion of feed. In many places the young plants are thick enough, but from the long continuance of dry weather they are going off from want of moisture, and from the attack of the grub-worm, and a sort of caterpillar, vulgarly called the "nigger." In other situations, where the plants just manage to keep alive, they are becoming set and stunted, and even under the most favorable circumstances for the future, they can never sufficiently rally so as to produce an average quantity of keep. This deficiency of food naturally enough now begins to have an obvious effect on the price of lean stock. Two considerable sheep fairs have been held in this county within the last month—Horsham and Lyndfield—Horsham on the 18th of July, and Lyndfield on the 5th inst. At Horsham fair, although the number of sheep and lambs penned very far exceeded the number of last year, still the trade was very brisk, and by four o'clock in the afternoon almost every lot of sheep was disposed of. Lambs sold from 14s to 22s; ewes from 28s to 30s; and lean wethers, of different ages, in a fair proportion to the above prices; all was bustle, and on the part of the sellers all was satisfactory and right, with the exception of the wool trade, which on this day seemed to be at a standstill.

The trade, however, at Lyndfield, on the 5th inst., presented a scene exactly the reverse of Horsham fair. The continuance of dry weather since that day had a sensible effect, and where sales were accomplished it was at a decline in price of from 2s to 3s a-head; and, as if to render occurrences of this day diametrically opposite to those of Horsham fair, the wool trade appeared to have revived, and a considerable demand for this commodity existed throughout the day, at from 44s to 46s the tod of 32lbs. The price of wool, when compared with other agricultural produce,

will seldom present any thing like a fair proportion of value; it may be lower in its proportion, or it may be higher, just according to the demand in Foreign Markets for wool, and English manufactured woollen goods; and as neither English wheat, barley, or oats are eligible for exportation, either in the raw or manufactured state, so will grain remain in price totally unbiassed by various causes which may operate either injuriously or beneficially to the trade in wool. Whilst on the subject of wool, I trust you will pardon me mentioning a matter of local interest only, but as I know your Magazine is read by several gentlemen to whom I wish especially to address myself on the policy of establishing a wool fair at Chichester, I will, with your permission, make it the vehicle of my observations to them.

Along the range of hills from Postdown, in Hampshire, about 16 miles to the north-west of Chichester to Arundel, and the surrounding downs about the same distance to the north-east of Chichester, numerous flocks are kept of from 400 to 1000 sheep on each farm; and in the section of country below, and to the south-east of Chichester, encompassing about the same distance as above, being a very fertile tract, many thousand sheep are fed by the graziers, including a few low country flocks; and immediately to the north towards Aldhurst, and then back to the farms round Petworth, being a continuous turnip soil of many miles in extent, the keeping of sheep is also a first object with the farmers of this district; consequently it is obvious that Chichester forms the pivot to a circle of a wool producing country. Now how is the vast quantity of wool which is produced here disposed of? Why, by a monopoly enjoyed by two or three wool staplers, who have the riding of the country entirely to themselves. Each takes his own custom, as he chooses to call it, and with this knot of dealers it would be considered a complete breach of faith if one should endeavour to supplant the other by a higher bidding for any lot of wool, although circumstances might occur to render it more valuable for a certain season to one agent than to another. But under the present system the farmer is quite shut out from deriving any benefit from such a state of things; the buyers manage these matters entirely within themselves, and the grower is seldom aware of the fact. Is it possible, I should ask then, but that the result of an open competition, such as a fair would afford, could fail of giving a decided advantage to the growers of wool; and, I think I may add, with one or two exceptions, to the buyers also; and when it is remembered that there is no wool fair within a distance of 30 miles from Chichester, and that the patronage of the Duke of Richmond and his tenantry would ensure the success of an attempt to establish so desirable an object in this city, it is ardently to be hoped that his Grace, who is always

ready to promote the interest of agriculture, may be induced to lend his powerful aid towards the bringing about an event, the result of which would undoubtedly afford a decided advantage to the neighbourhood. I am aware many growers of wool, if they do not object entirely to the plan of establishing a fair, think that the trouble and expense attending it would not be compensated for by any advantage it would be likely to secure, and that the present method of having *a dealer to come to the wool* is far more convenient *than taking the wool to the dealer*. There may be some truth in this, but let it be remembered that the most *convenient* way of transacting business is not always the most *profitable*, and that the maxim of "a clear stage and no favour" is far more admissible as a principle on matters of buying and selling, than the old adage of "between you and I and the gate post." For my present purpose I cannot help wishing that a *wool pack* had been originally substituted for a *gate post*.

As I have so far infringed on your space by allusion to a subject so very confined in its interest, I cannot refrain, if you will so far extend your courtesy towards me, from mentioning another matter also connected with the country round Chichester. I allude to the long standing and much to be regretted feeling of rivalry which exists between the supporters of the Old Pitch Market and the advocates and friends of the New Pitch Market. In the following observations, I trust, I shall be acquitted of any intention to advocate the cause of either party, or, in fact, of forming any opinion whatever on the original dispute (of which, in truth, I do not even know the outline) which occasioned this separation of the very men who only a few years since, in the strictest unanimity of opinion and action, succeeded in establishing, in spite of a strong opposition, a Pitch Market in lieu of the Old Sample Market, which had become a monopoly almost equal in its exclusiveness to the system of the wool trade, which I have mentioned above. My only object is to call the attention of those persons, who have the power to remedy the evil, to the serious inconvenience which occurs under present circumstances, to almost every farmer who is in the habit of attending this market, and to view an arrangement, having for its object the uniting of the two corn stores, as a matter of *expediency* only, without the slightest reference to the merits of the dispute. In the first place the division of the market has the effect of preventing a great deal of corn from being pitched at all, because there are persons who, from a disinclination to offend either party, refrain from availing themselves of the Pitch Market, and continue to sell by sample. And this is not the only motive which operates on the minds of many persons, to deter them pitching corn. The division of the dealers, which two markets occasion, militates against the interest of the farmer, and gives a decided advantage to the buyer, inasmuch as it destroys that complete independence on the part of the former, which it is always necessary should exist in order to ensure equal terms to either party in buying and selling. The dealer derives this advantage from the constant apprehension the supporters of each market labour under, that the dealers may cease to patronise the store they have heretofore attended, and think it more to their advantage in future to quarter in the camp of the adversary; the consequence is, there is at all times a bias on the part of the warmest and most interested supporters of both markets to treat the buyers, who

individually support their cause, in such a manner that they may continue their preference; and one sale so made to *fickle a dealer*, does not fail to have its due effect throughout the market. I have been present in both markets, when such a dialogue, in substance, as the following has transpired.—Dealer (putting his hand into the sample sack)—"Well, Sir, what do you ask for this wheat to day?" Farmer—"Nine pounds." Dealer—"I do not know how it is, but this market is always higher than the other, which I am just come from, and where I was offered better wheat than yours for 5s a load less money, and if you are not inclined to take 10s a load less than you are all at present asking here, I *must go back to the other store, and lay out my money there*." Now does not this at once establish the fact, that the tendency of the spirit of rivalry is injurious to the seller and favorable to the buyer; and if this be admitted, is it not somewhat of a reflection on the partisans of both establishments, that some steps are not taken in order to bring the matter at issue to some *equitable* arrangement. Surely it is quite unnecessary for farmers themselves to be the means of adding one difficulty more to those by which the landed interest is beset, better rather hang together like a *bundle of sticks*, and so secure *at least* those advantages which unanimity will always afford.

The present very forward harvest offers another capital opportunity for sowing the trifolium clover in the wheat and barley stubbles; and the fact of being enabled to sow it during the present month, is certainly half way towards the assurance of a crop; but, on the contrary, if the sowing of it be protracted till the middle or end of September, there is great danger of frost following before the seed has well hold of the ground, and then the great probability is that it would never arrive at maturity.

I took some trouble last spring to examine several fields of this new clover; and I am satisfied there are two distinct sorts of this genus, and which may not, I think, be inaptly named, the Dwarf and the Giant. It appears to me the difference is quite as distinct, both in appearance and productiveness, as in the English and Foreign spring tares. The best piece I saw last year was grown in the manhood of this county, and in order to convey some idea of the immense bulk of produce, it is only necessary to state that the cart horses on the farm were kept in the yard on the trifolium only, and that half a rod only was found sufficient for each horse. This field was sown out of a wheat stubble, having been once ploughed, and two gallons of seed allowed on an acre. The notion of sowing it on the *whole ground*, and merely harrowing it in, without ploughing at all, is a decided error. I saw a signal failure of this sort last season, on a field excellently calculated, under a proper system of management, to produce a good crop. There can be no doubt but that the trifolium will be very generally sown this autumn on account of the dying off of the seeds sown in the Lent corn, occasioned by the unusual dry weather, and as it makes a capital substitute for red clover for hay, it seems to have established itself as a valuable acquaintance at a peculiarly happy time. Great care should, I think, be taken not to deposit the seed *too deep*, and consequently the harrowing and rolling should be *nearly* completed before the seed is sown; and if it be a very light season, the more the ground is trod with stock the better, because a firm rooting for the plant will be thus secured. Two or three years ago, when this species of clover had not emanci-

pated beyond the purlieus of the experimentalists, I asked a friend of mine, who is a famous botanist, what he thought of its qualifications, he having tried a patch in his garden. His reply was, "Oh, it is a capital plant to yield, only there is one little difficulty relating to it, namely, *nothing will eat it.*" My friend drew his conclusions too hastily, and I suppose he had offered it to his stock when they were at full keep at grass or winter tares, and then I have no doubt that they would refuse to eat it, as undoubtedly they would have refused to eat lucerne under like circumstances.

When horses are fed on lucerne it is unusual to give them any other green food; so should it be with the trifolium, and then not only will both cattle and sheep eat it, but will also do well on it.—I am, Sir, your obedient and very humble servant,  
 AGRICULTURER.

*Sussex, August 17, 1835.*

### SUSSEX.

FROM KENNEDY AND GRAINGER'S PRACTICE OF TENANCY IN THE GRAZING DISTRICTS OF GREAT BRITAIN; PUBLISHED IN 1829.

To several particulars connected with this county, having already noticed them in our former work, it is unnecessary again to advert. The natural herbage of Sussex is generally good, though chiefly adapted for summer, but on the dry uplands, it is nutritious for sheep and cattle during great part of the winter.

There is no custom here binding the landlords to take the stock upon sheep farms, at the expiration of the lease; neither is the in-coming tenant under any obligation to take either live or dead stock; it would, however, be advisable for the stock to be taken at a valuation. All the sheep farms in Sussex have a considerable proportion of arable land attached to them; a farm, for instance carrying 1,000 ewes, would consist of 600 acres of arable and 600 acres of down. The arable land comprised in these farms, is held under the same restrictions that are applied to the other cultivated parts of the county.

The flocks on the South Downs in Sussex, are all South Down ewes or wethers. The weathers are flocked by themselves, as are also the two-tooth ewes, but the three and four-tooth ewes are put together. A great number of Dorset and South Down ewes are kept in the Weald for the purpose of fattening the lambs, likewise wethers for the same purpose; none but South Down ewes are kept for stock. The average weight of a Down fleece is 2½ pounds, and of a Dorset 4 pounds. The ewes have their first lamb at two years old.

With regard to the smearing of sheep, no experiment has been tried here with what is called Taylor's salve; but if an application of grease was resorted to, and properly administered, there is no doubt it would produce a beneficial result.

The South Down sheep are considered to be more profitable, and to produce better wool than any other kind of sheep, which can exist upon the herbage of the county, or under the mode of treatment that is found necessary. It is by crossing some of the formerly coarsest short woolled sheep, such as those of Wiltshire, Berkshire, and parts of Hampshire, with the South Downs, Merinos, and Rylands, that a far superior and finer fleece has been produced than that which they originally possessed; and there is no doubt that the fleeces are very generally improved throughout Great Britain; but the error into which many

persons unacquainted with the various changes and crosses that have taken place in the different counties are led, is, that they are induced to consider a great part of the wool which is sent into the markets from various districts, as South Down, when, probably, the original stock from which it has been produced, was of the commonest and coarsest short woolled breed, but having a cross of South Down, or Merino, it thence takes the best selling name; and thus, perhaps, arises the idea amongst the staplers and manufacturers, that the fine wools of Britain have deteriorated, whereas the direct contrary is known to be the fact.

On the South Downs, sheep and wool are greatly depended upon for profit. The land in this county varies so much in price and goodness, and the sheep farms being differently situated, some having more Down land than others, that it would be difficult to average the rent of land, per head. The sheep districts in England are differently circumstanced to those in Scotland; the sheep in the former being supported by a great quantity of artificial food, which is provided for them, the expense of which ought to be repaid by the grain they contribute to produce; whilst, in the latter, they subsist on the natural herbage, which renders easy the estimate of rent per head.

The South Down farmers, with respect to the sheep they are enabled to dispose of at different ages, calculate by the score; they consider that the amount of a remunerating price varies according to the nature of the land, from £15. to £25. per score; that of wool, is estimated at from 1s. 3d. to 1s. 9d. per pound.

The shepherds are paid by the week, or the year, at the rate of from 12s. to 15s. per week.

The sheep on the Downs are washed with a preparation of arsenic and water, at an expence of 1d. per head.

It is estimated, that wool on the South Downs ought to pay one fifth of the rent. The sheep farms, however, owing to the low price of their produce, have decreased in value full one third; and if the present depression continues, the situation of the farmers must gradually, or even rapidly, become worse and worse.

The South Down farmers send out to keep, their ewe lambs which they intend for stock, from Michaelmas to Lady-day, at a charge of 5s per head.

The current price of South Down wool, in Sussex, has been for the last ten years, from £3. to £1. 8s. per 32 pounds; that of wethers for the same period, from £1. 14s. to £1. 6s.; of ewes, from £1. 9s. to 19s.; and of lambs, from £1. 9s. to 9s. On the South Downs, the flocks that are kept are ewe flocks.

The produce of 1,000 ewes would be, according to present prices, £750, leaving but a trifling remuneration to the grower, after paying rent, taxes, and other necessary charges.

No doubt is entertained here that the wool partakes of the colour of the soil. Herbage grown on chalky soils, is believed to produce the finest wool, but it is not considered that the chalk renders it so, or that it absorbs the yolk, and thereby depriving the wool of its requisite nourishment. Sheep that have to travel most for their food, it is observed, produce the shortest and finest wool. The heat of the sun, it is believed, encourages, to a certain extent, the growth of wool, which is also promoted by unguents, properly applied. It is also thought, that slightly greasing the sheep soon after clipping, as well as on the approach of winter, would improve the fleece, and that the expence would be repaid by the additional quantity of

wool. The quantity of yolk is believed to be very materially increased by particular modes of feeding.

An application of grease to the sheep, used immediately after shearing, has a tendency to prevent cutaneous diseases, and the effects arising from fly, &c.; greased sheep, also, throw off snow and rain much sooner than those that are not greased. It is thought, that, for this purpose, wax might be substituted instead of tar, by which any discolouration of the fleece might be avoided.

The sheep, in Sussex, are usually washed in ponds, the water of which cleanses the wool much better than a running stream, it being softer.

The housing or coting of sheep in inclement weather, would, it is considered, repay the expense; but this is not to be understood to mean close confinement, which would cause the sheep to lose the wool upon their bellies before the time of clipping, through their lying upon dung.

There is a great difference, in point of time, with regard to the effect produced upon different breeds of sheep as to the fleece, by a change of pasture; the Merino, or Spanish, are supposed to resist longer than any other breed, any alteration in the fleece arising from this cause: those sheep which fatten the quickest, are believed to feel the effect the soonest.

It has been found here, that, by overstocking rich pastures, the fleece is not improved in fineness, but, on the contrary, it is deteriorated, and becomes jointed; the same effect is not produced upon poor pastures, which is to be accounted for from the quality of the herbage. It has also been ascertained, that the wool, after a mild winter, is stronger than after a severe season, but not coarser, the animal not obtaining a sufficiency of food in the latter, renders the wool weaker. The wool, however, which is grown during the winter, is of very trifling amount; for which reason the application of an unguent after shearing, would be very beneficial, as it would not only tend to increase the growth of wool, but also to prevent the sheep being disturbed by the fly. Whatever, indeed, tends to increase the growth of the wool after clipping, would be strictly in unison with the order of nature, it being well known that birds and beasts are all furnished with their winter clothing previous to the approach of winter.

#### WOOD GROUSE.—PLATE.

The wood grouse, called also capercali and cock of the wood, it is said, was once well known in Scotland: but, in the memory of the present generation it has not been seen in the United Kingdom, except what has reached this country from more northern regions consigned to the poulterers of the metropolis. Like the ptarmigan, the cock of the wood is found in northern latitudes, and never met with in warm climates: to protect it against the severity of the weather during the winter, when its native forests are covered with snow, it is feathered to the toes, and indeed the animal economy of the bird is calculated for the situation which it inhabits.

The cock of the woods we are told by Goldsmith and others who have written on the subject, will sometimes weigh fourteen or fifteen pounds, but such accounts, like "Lectures on Field Sports," which appear monthly in the *Sporting Magazine*, are not to be relied on. The cases are somewhat similar,—Goldsmith published a *Natural History*, without possessing a particle of practical knowledge of the subject, but was, nevertheless, a well-read theorist;

while the editor of the periodical before mentioned, though utterly unacquainted with practical development, and too soporific to acquire a theoretical index, contrives, nevertheless, to issue his lucid illustrations of the chase with the impervious self-satisfaction of unblushing ignorance! In regard to the weight of the cock of the wood, from the specimens which have fallen under my observation, I should think it considerably over-rated. The colour of the male of this splendid variety of the grouse tribe is principally black: the feathers of the female are of a lighter colour than those of the male, and she is not nearly so large. This bird is found in Prussia and the north of Germany, but for the best account of it we are indebted to Mr. Lloyd, from whom I have borrowed much of the following description:—

The capercali is to be found in most parts of the Scandinavian peninsula, indeed, as far to the north as the pine tree is seen to flourish, which is very near to the North Cape itself. These birds are however, very scarce in the more southern of the Swedish provinces. The favourite haunts of the capercali are extensive fir woods. In coppices or small covers he is seldom if ever to be found. Professor Nilsson observes, that those which breed in the larger forests remain there all the year round, but those which on the contrary, breed on the fjall\* sides, or in a more open part of the country, in the event of deep snow, usually come down to the flower grounds.

The principal food of the capercali, when in a state of nature, consists of juniperberries, cranberries, and other berries common to the forests of the north, as well as insects, and in winter the tender buds of the pine, birch, &c.

The female forms her nest on the ground, after the manner of all the gallinaceous tribe, and lays from six to twelve eggs, which, like those of the peahen, are hatched at the end of the month. The family keep together till the approach of winter, and the cocks separate from the mother before the hens.

During the day the capercali keep much on the ground, except it be deeply covered with snow; very commonly, however, the cock sits on the pine tree. These birds roost in the trees. The capercali flies heavily, with much noise and labour, and neither rises high in the air, nor flies to any great distance.

The cocks do not attain their full growth till the third year, and therefore it is fair to infer that they live for a considerable length of time. Mr. Lloyd is of opinion that the size of these birds depends in a great degree on the latitude where they are found. In Lapland, for instance, the cocks seldom exceed nine or ten pounds, while in the southern provinces of Sweden they are said to be much larger. With the capercali, as with other birds, occasional varieties in plumage are to be found; and some few years back a hen was shot in Russia nearly white.

Our Swedish traveller already mentioned, observes, "The capercali occasionally breed with the black game, the produce of which are called *Racklehanen*; these partake of the leading characteristics of both species, but their size and colour greatly depend whether the connection was between the capercali cock and the grey hen, or vice versa. Out of *Racklehanen*, which is the male, two, according to Mr. Falk, are not alike, and the difference of colour observable among the *Racklehanen*, which is the female, but which is very rare, is still greater. *Racklehanen* are seldom to be met with. During my stay in Wermeland, however, Mr. Falk had two of these birds in his possession, and I myself shot a third."

\* High mountains, the summits of which are above the limits of arboreal vegetation.

WOOD COCKS. CAPERCAILL.

The capercali is often domesticated in Sweden, and will become so perfectly tame as to feed out of the hand. In a domestic state they are principally fed with oats, and the berries already mentioned. It has been asserted that capercali will not breed in a domesticated state, but the contrary has been repeatedly proved. "A few years ago I procured a brace of these birds, consisting of cock and hen, for a friend of mine, Mr. Thomas Fowler Buxton, then resident at Cromer Hall, Norfolk. After the lapse of a few months, the hen laid six eggs, from which in due process six capercali were produced. The chicks lived until they had attained a very considerable size, when, owing to the effects, as it was supposed, of a burning sun, to which they had been incautiously exposed, the whole of them together with the mother, died. On this mishap, the old cock, the only survivor, was turned loose into the game preserves, where he continued in a thriving condition for about a year and a half. At last however, he also met his doom, though this was supposed to be owing rather to accidental than natural causes."

On the subject of domesticating the capercali, Mr. Nilsson speaking of some of these birds which were kept at a forge in Delecarlia, observes, "they were kept together during the winter season in a large loft over a barn, and were fed with corn, and occasionally a change of fresh spruce, fir, pine, and juniper sprigs. Early in spring they were let into an inclosure near the house, protected by a high and close fence, in which were several firs and pines, the common trees of the place. In this inclosure they were never disturbed, and during the season of incubation no one approached except the person who laid in the food, which at that time consisted of barley, besides fresh sprigs of the kind before mentioned. It is an indispensable rule that they shall have full liberty and remain entirely undisturbed, if the hens are to sit and hatch their young. As soon as this had occurred, and the brood were out, they were removed to the yard, which was also roomy, and so closely fenced that the young ones could not escape through, and within this fence were hedges and a number of bushes planted. Of the old ones, one of the wings was always clipped to prevent their flying. I have seen several times such broods, both of black game and capercali, eight to twelve young ones belonging to each hen. They were so tame, that, like our common hen, they would run forward when corn was thrown to them. They should always have a good supply of sand and fresh water."

On rearing the young of the capercali, Mr. Greiff makes the following remarks:—"They are to be supplied with ant eggs in conjunction with the materials of which the hills of those insects are composed; hard boiled eggs are to be chopped and mixed among fine moistened barley meal; also pea-hum and trefoil grass. They must have plenty of water, which must be placed so that they cannot overturn the picher for they suffer very much if they get wet when they are young. Dry sand and mould they should never be without; when they get larger, and cabbage leaves, strawberries, cranberries, and blueberries are to be had, they are fond of such food; and when they are full grown they eat barley and wheat; in winter they should get young shoots of pine and birch buds. I have seen many people who thought they treated young birds well by giving them juniper berries: but they never resort to this kind of food but in case of necessity."

It has been asserted that the capercali, in a state of unlimited freedom, has been known to forget his inherent shyness, and to attack persons when approaching his place of resort. During a number of

years, an old capercali cock had been in the habit of frequenting the estate of Villenge, at Wermdo, who, as often as he heard the voice of people in the adjoining wood, had the boldness to station himself on the ground, and during a continual flapping of his wings, pecked at the legs and feet of those who disturbed his domain." Further, a capercali cock frequented a wood a mile distant from Renthendorf, in which was a path or roadway. This bird, as soon as it perceived any person approach, would fly towards him, peck his legs, rap him with his wings, and was with difficulty driven away. A sportsman succeeded in taking the bird, and carried it to a place fourteen miles distant: however, on the following day it was found that the capercali had returned to its accustomed abode. Another person afterwards succeeded in taking him with the intention of carrying him to Ofwer-Jagmastare. At first the bird was quiet, but he soon began to peck and tear at the man so effectually that the latter was compelled to restore him to his liberty. However, after the lapse of a few months, he totally disappeared, having probably fallen into the hands of a less timid or less merciful bird-catcher.

In speaking of dogs proper for capercali shooting, Mr. Greiff observes, "they ought to be small; not to bark violently, but only now and then; to hunt at a short distance from the sportsman; to have a good and sure scent, and to be easily called in. When the frosty nights commence the capercali sits better to the cocker than at other times."

In the forest, the capercali does not always present an easy mark when he takes wing from a tree: for dipping down from the pines nearly to the ground as is frequently the case, they are often almost out of distance before a person can take aim: of course, large shot is indispensable.

In the early part of autumn, cocks and hens sit equally well to a dog; but, as the season advances, the cocks become so excessively wild as usually to take flight the instant the dog begins to challenge. This is not always the case with the hens, for these will often remain in the trees during all periods of the year, until a person approaches immediately near them. Something similar is observable with black game in this country, and a similarity will be recognised in the following characteristic: on the approach of winter, the capercali congregate and are found in packs during the winter; an association however, in which the hens are seldom seen. These packs which frequently contain from fifty to a hundred birds, usually keep to the sides of the numerous lakes and morasses with which the northern forests abound, and to pursue these noble birds under such circumstances with a good rifle, forms an amusement worthy of a genuine sportsman—at least among the frozen snows and dark forests of the north, where superior diversion is unattainable.

Amongst other expedients to which the Swedes resort for the capture of the capercali is the following:—During the autumnal months, after raising and dispersing the brood, persons place themselves in ambush, and imitate the cry of the old hen, or young birds, as circumstances may require. By thus alluring them to the spot, the whole brood are sometimes shot in succession. Upon this subject Mr. Greiff observes:—"After the brood has been dispersed, and you see the growth they have acquired, the dogs are to be taken up, and a hut formed precisely on the spot from whence they were driven, in which you place yourself to call, and you adapt your calling to the greater or less size of the young birds. When they are as large as the hen, you ought not to begin to

call until an hour after they have been flushed : should you wish to take them alive, a net is placed round him who calls. Towards the quarter where the hen flies, there are seldom to be found any of the young birds, for she tries by her cackling to draw the dogs after her, and from her young ones. So long as you wish to continue your sport, you must not go out of your hut to collect the birds you have shot. When the hen answers the call, or lows like a cow, she has either got a young one with her, or the calling is incorrect ; or else she has been frightened, and will not then quit her place. A young hen answers more readily to the call than an old one. Most of the forest birds (continues the writer) are caught in autumn by bird lime, or the usual snares, and also by nets. In all these methods it is necessary to lead the bird by low rows of brush-wood into small pathways. With snares of fine brass wire suspended over these he is easily caught. One of my methods, by which I have amused myself and taken many birds alive, is a simple knotted square silk net of thirty inches width in the square, and the meshes so large that the capercali can easily put his head through : this is to be hung over the pathway, and fastened slightly to small branches by weak woollen yarn, just sufficient to support the net in a square form, with some small twigs and leaves of the fir spread over it ; round the net a silk line is passed through the extreme meshes, and fastened to a stout bush. When the capercali has got his head into a mesh of the net, and finds that something opposes him, he always runs directly forward, when the silk line is drawn close, and the bird lies as if in a reticule, with his wings pressed to his body, unable to move himself, or to tear the net, however weak it may be, although it should always be made of twisted silk. In autumn, when the cranberry is plentiful in the forest, by strewing these berries on each side of the net, you entice the birds to advance eagerly. This sport produces much amusement. Of the supply this bird furnishes to the larder, and the delicious dish it forms when brought to table, every one knows the value."

Capercali are also shot in the night by torch-light. But the plan, which is said to be very destructive, is confined to the southern provinces of Sweden. In Swaland and Ostergothland this is said to be effected in the following manner : towards nightfall, people watch the last flight of the capercali, before they go to roost. The direction they have taken into the forest is then carefully marked, by means of a prostrate tree, or by one which is felled especially for the purpose. After dark, two men start in pursuit of the birds : one of them is provided with a gun, the other with a long pole, to either end of which a flambeau is attached. The man with the flambeau goes in advance, the other remaining at the prostrate tree, to keep it and the two lights in an exact line with each other : by this curious contrivance, they cannot well go astray in the forest. Thus they proceed, occasionally halting and taking a fresh mark, until they come near to the spot where they may have reason to suppose the birds are roosting. They now carefully examine the trees ; and when they discover the object of pursuit, which are said to remain stupidly gaping at the fire blazing beneath, they shoot them at their leisure. However, should there be several capercali in the same tree, it becomes necessary to shoot them on the lower branches in the first instance : for, unless one of these birds fall on its companions, it is said the rest will never move, and, in consequence the whole of them may be easily killed.

Even the period of courtship does not protect the capercali from these northern sportsmen. Like the black cock, the cock of the wood, on the approach of spring, singles himself out and commences his amorous call : he stations himself on a pine at the first dawn of day, and, with his neck stretched out, his tail spread like a fan, his wings drooping, his feathers ruffled, he begins his *play* with a call the sound of which is difficult to describe, but supposed to resemble *peller, peller, peller* ; which at first he repeats at some little intervals, but as he proceeds they increase in rapidity until at last, and after perhaps the lapse of a minute or two, he makes a sort of gulp in his throat, and finishes with sucking in, as it were his breath. During this latter progress, which only continues a few seconds, the head of the capercali is thrown up, his eyes are partially closed, and his whole appearance would denote that he is worked up into an agony of passion. At this time, his faculties are so much absorbed that it is not difficult to approach him.

The play of the capercali is not loud ; and, should there be wind stirring in the trees at the time, it cannot be heard at any great distance. On hearing the call of the cock, the hens, whose cry in some degree resembles the croak of a raven, or rather perhaps the sound *gock-gock-gock*, assemble from all parts of the surrounding forest. The male now descends to the ground, where he and his female friends join company.

The capercali does not *play* indiscriminately all over the forest ; he has his certain stations or playing grounds, where, if unmolested, he may be heard in the spring for years together. On these *lek* or playing stations several capercali may occasionally be heard at the same time. But, so long as the old male birds are alive, they will not, it is said, permit the young ones, or those of the preceding season to play. Should the old birds, however, be killed, the young ones in the course of a day or two, usually open their pipes. Combats as it may be supposed, not unfrequently take place.

On these occasions, havock is made amongst the capercali : it being first ascertained where the *lek* is situated, the *sportsman* (if the term be not vilely prostituted) proceeds in profound silence, and listens until he hears the call of the cock. So long, however, as the bird only repeats his commencing sound, he must, if he be at all near him, remain stationary ; but the instant the cock of the wood comes to the wind-up, the gulp, &c., his faculties of perceiving the approach of his insidious enemy appear suspended, and the latter advances. Yet this finishing note lasts for so short a period, that the pot hunter is not able to advance more than three or four paces before it ceases ; and the instant that is the case, he must again halt, and if in an exposed situation, remain motionless as a statue. This is absolutely necessary ; for, notwithstanding what may have been said to the contrary, it is only during the finishing note just mentioned that the bird is off his guard. If all remain quiet the bird usually goes on again immediately with his first strain, and when he comes again to the finish, the fowler advances as before ; and so the business proceeds till the poor capercali is within gun shot, and receives his death at the moment he is wooing his mates.

At the *lek* the cocks are generally the sufferers, since the hens, as well from their colour more resembling the foliage of the trees, as from the shooter having much larger game in view, usually escape. Were it otherwise, were a proportionate slaughter to

take place among the latter as the former, the breed would soon be exterminated.

Although this plan of shooting the capercali during the spring, is common enough throughout most parts of Scandinavia, in Norrland Wasterbotton, whence Stockholm is furnished with its principal supplies of game, that destructive practice is not tolerated.

Though so many of these splendid birds are killed by the unsportsman-like methods already enumerated, it rarely happens that more than one of them is killed at a shot; indeed, (says Lloyd) "I never heard of but one solitary instance where as many as three were killed at one discharge. This, I am aware, is a little at variance with the statement of other Scandinavian travellers, one among whom says—'In that season (the spring) the peasant, at an early hour of the morning, sallies forth into the forest, armed with his fowling-piece, and listens attentively for the voice of the cock, who, perched on a lofty pine, brings the hens together from all parts: the cocks likewise repair to the spot, and, instigated by love and jealousy, a furious battle commences, during which they are so deeply engaged, and so inattentive to their own safety, that the gunner will frequently kill no less than a dozen of these large birds at a shot. Of course it is not for me to contradict this statement, though independently of its not being usual for capercali to engage in such battles royal as are here described, it would seem to require a gun of no ordinary calibre to slaughter, at a single discharge, a dozen birds, each of which is as large as a turkey-cock.'"

In the early part of this article it was remarked, that, according to report, the cock of the wood was, some centuries ago, to be found in the Highlands of Scotland: that such might have been the case is probable enough, though, if at this period, we are to reason upon the state of things at the anterior distance just mentioned, we may conclude that inasmuch as there were few extensive woods or plantations, and the Highlands were thickly or numerous peopled (by comparison) the noble capercali could not have been general, though it might be found in particular places: in fact, the tradition points out the neighbourhood of Inverness as the locality which, whatever might have been the case in former times, is, at the present day, well calculated for the birds in question. The situation of Inverness (the capital of the Highlands) is the most beautiful of any town I met with in Scotland; the scenery is highly interesting, yet it presents a very different character to an English landscape, but is not on that account less interesting to an Englishman. In the direction of Barnsley, the scenery is not only beautiful, but luxuriant; it presents not the dreary wildness which so frequently occurs in the Highlands, and which gives a chilling sameness to many of the views. In the direction of Loch Broom, Loch Ewe, Loch Carron, and Loch Duich, the views partake very much of this character; while towards Beaulie or Beaulie, the road from Inverness to which runs along the border of Loch Deaulie, the appearance is highly romantic and beautiful. Towards the west, the mountains of Rossshire are seen in almost fantastic variety; while in the valleys are numerous and extensive plantations of fir, amidst which the capercali might find food and protection. At a period not very remote, very little timber was to be seen in the Highlands of Scotland; nor indeed was it till after the visit of Dr. Johnson to these regions that planting became general. In Caithness, the most northern point of Scotland, few trees are to be met with; but after the Ord is passed in the southerly direction, the country assumes a different appearance. In

Sutherlandshire (which joins Caithness) the plantations of fir are numerous and extensive: in fact, the country, from the picturesque mountains and valleys of Berrydale all the way to Clashmore is well calculated for the abode of the capercali. There is a good inn at Berrydale, situated in one of the most romantic glens I ever beheld; the sides of the adjoining mountains are beautifully fringed with trees and shrubs. Rossshire, from the town of Tain to the neighbourhood of Inverness, may be said to be covered with woods and plantations; whence proceeding down Loch Ness till we reach Glengary's county on the right, and Mr. Frazer's (once Lord Lovat's) on the left, we shall perceive that the well-wooded wilds of these mountainous regions are admirably calculated for sheltering the splendid variety of the grouse tribe under consideration. Then again, passing up Glencoe and crossing the Moor of Rannoch, we come to the property of Lord Breadalbane in the piney district of Glenorchy and its neighbourhood, to say nothing of the great extent of country from this district to the bottom of Loch Lomond, the greater part is well calculated for the purpose in question.

Also let it not be forgotten that as the Highlands, owing to the union, alteration of manners and character, and the spirit of emigration, these mountainous, and, in many parts, sterile regions, which at no period could be numerously peopled, do not at present contain half the number of inhabitants, which contrived to exist in those days when *clanism* was in its vigor. In consequence the birds would be less liable to annoyance from human intrusion, while from the very numerous plantations which have been formed within the last century, abundance of shelter would be found; what, therefore, could be more easy or more eligible than the introduction of these fine birds in the Highlands of Scotland. Indeed, the same observation may be extended to the Lowlands, many parts of which, particularly the neighbourhood of Nithsdale, are equally well calculated for the purpose. Scotland at present produces abundance of white and red grouse, as well as black game—the capercali would form a splendid addition.

Of the capercali, male and female, an admirable delineation accompanies the present number; and in closing this article, I will place before the reader a short notice of two other varieties of the grouse tribe, which have never been seen in this country in a state of unlimited freedom. The *Hazel Hen* is of a brown colour, about the size of a partridge, and thought to be the most beautiful bird of the grouse kind. In Sweden they are reckoned a great delicacy, and their flesh considered the most wholesome of the grouse kind. This bird is found in abundance in all the northern parts of Scandinavia, but it is not generally to be found farther to the southward, in that peninsula, than the sixty-ninth degree of latitude, owing, perhaps, to the quality of the soil, as they are to be met with both in Germany and France.

Like the red grouse, these birds pair. The female forms her nest on the ground, into which she deposits from eight to fourteen eggs, in this respect also resembling the red grouse.

During the summer months, the hazel hen feeds upon worms, insects, and berries, but in winter, it is constrained to supply the cravings of its appetite upon the buds of the alder, birch, and other trees. It frequents the thickest brakes of the forest, and is generally to be met with on the ground. When raised, it uniformly takes to the trees. Its flight, which is quick and attended with much noise, is usually very slow.

So stupid is this bird, that it will often allow a person to fire at it more than once without taking wing. When the Swedish sportsmen go out for the pursuit of this bird, they are provided with a small pipe, by means of which they are enabled so exactly to imitate its call, that it will immediately answer, and the shooter has no great difficulty in discovering it, even when perched among the foliage of the most luxuriant trees.

The *Ripa*, a bird found in the dark forests of the north of Europe, presents the characteristics of the grouse genus, and of which it appears there are two varieties, namely, the fjäll ripa and the dal ripa. Of the former, it may be observed that, during the summer season the predominant colours are speckled black, brown, or grey, the shades varying very much according as the season is more or less advanced; there is, however, a very great disparity in the plumage of the male and the female, the former being of a much darker colour than the latter. But in the winter time, its plumage, with the exception of the tail feathers, which are always black, tipped with white, is entirely white. The length of the male is from thirteen to fourteen inches, and the breadth across the wings about twenty-four inches.

The fjäll ripa is to be found in all the more northern parts of Scandinavia, as well on the continent as on the adjacent islands. Their usual resort are the lofty mountains, whose summits are destitute of trees; but during heavy snows they may be frequently observed in the lower grounds.

Like the preceding variety, these birds pair. The hen forms her nest among stones, and lays from eight to twelve eggs. Whilst she is sitting, the male is constantly in the vicinity of the nest; but as soon as the chicks are out of the shell, it is said he deserts both the mother and brood, and repairing to the higher parts of the mountains, he associates with other males similarly circumstanced to himself. Thus thirty or forty cocks may be sometimes seen in company, upon which occasions, however, they are very difficult of approach. But in the month of August, when the young have become tolerably well-fledged, the old hen leads them likewise to the more elevated regions, when the sire associates himself with the family.

On the approach of winter, these birds pack, and become very wild. In summer they feed for the most part on leaves, flowers, the seeds of plants which grow on the elevated places where they principally haunt, and insects; the young for some weeks subsist entirely upon the latter.

The fjäll or mountain ripa, like the red grouse, flies with uncommon celerity; it often happens that a strong hawk, by which these birds are much pursued, is distanced in the chase. On such occasions, the ripa endeavours to keep above his fierce pursuer, aware that he is thus safe; and in consequence he sometimes soars so high, that both the pursued and the pursuer become lost to the eye of the spectator.

The dal ripa is somewhat larger than the bird just described, and differs also in its plumage, as well as in several other respects. During summer, the neck and breast of the male is of a reddish brown; the back dark brown; the belly, the outer part of the wings and legs, white. The female is beautifully speckled nearly all over the body, the predominant colours being black, brown, and grey; the coverts of the wings and legs, whitish; but, as in the preceding instance, the colours vary according to the season. In winter both male and female become completely

white, with the exception of the tail feathers, which are at all times black, tipped with white. The length of the male is about fifteen inches; the breadth across the wings from twenty-five to twenty-six inches. The female is smaller than the male.

As the usual resort of the fjäll ripa is the lofty mountains, the dal ripa on the contrary, is only to be seen within the range of arboreous vegetation, which frequently, however, happens to be at a very considerable elevation on the sides of the hills. This bird is generally on the ground both night and day. In the summer season the dal ripa seeds upon the leaves of various plants, such as the grass willow and several other kinds of willow, the blue-berry bush, and especially the seeds and the seed-vessels of the knot grass or bread-wort: like all other varieties of the tribe, they devour vast quantities of insects. In winter they are forced to feed upon buds and seeds, particularly those of the dwarf and common birch.

The flesh of these birds is supposed to be superior to that of the fjäll ripa, but inferior to that of the hazel hen. They pair. The nest is formed amongst heather, or under the shelter of a bush, into which ten or twelve eggs are deposited. During incubation, the female is attended by the male, who defends her in the most courageous manner from danger. He manifests great regard for the young brood in the same manner as the red grouse.

Were I the owner of Dunrobin Castle or of Inverary, were I Lord Glenorchy or any other extensive Highland proprietor, I would soon animate the hills with the birds of which I have been speaking. We should then possess an extensive and a very interesting variety, the whole of which might be pursued—not like the Swedish sportsmen, with torches, nets, &c.—but in the genuine style of our own superior taste, with the pointer and percussion, as I have not the least doubt these beautiful northern grouse are approachable precisely in the same manner as the black cock, the red grouse, or the ptarmigan of Great Britain.

The Lincoln and Lindsey Joint-Stock Banking Company held their annual meeting on the 6th inst. On the accounts being audited, there appeared a dividend of  $7\frac{1}{2}$  per cent from the profits:  $1\frac{1}{2}$  per cent was reserved, and 6 per cent divided. The company's nominal capital is 200,000*l*, their paid up capital 20,000*l*, which is now to be advanced to 30,000*l*. Their notes, it was stated, have a very healthy circulation, and it is not unlikely that their dividend of profits will be considerably larger next year.

A farmer at Trowbridge has tried on an acre of land, the effect of planting wheat about a foot apart. He last year had 18 sacks from an acre and a quarter; and from one acre of land which he has this year planted in the same way he expects 20 sacks of wheat. He has tried in this manner the red straw Lammis and the Taunton white wheat, and has found them both doubly productive; on this principle two pecks of seed are sufficient for an acre. In the winter there was scarcely the appearance of a blade, but when the spring advanced the crop began to look luxuriantly healthy and strong. The farmer thinks that if planted 18 inches apart he would have a still better crop; he means to try this next year, and we will then state the result.

The mean temperature of the external air in July was one degree and three-quarters higher than the mean of July for a series of years.

## SEED-WHEAT.

Three years ago Colonel Le Couteur, one of the Deputies from the island of Jersey, became acquainted with Professor La Gasca, one of the most celebrated botanists in Europe, who had been Curator of the Royal Gardens at Madrid, and obliged to leave Spain, where he is again restored to his friends, and to his former situation.

The Professor was then growing about 80 sorts of wheat in the garden of Mr. Saunders, nurseryman in Jersey. Their variety, classification, and beauty, struck Mr. Le Couteur, who sought to acquire all the information he could from Professor La Gasca. The latter told him that for the last twenty-five years he had been employed in studying the properties and character of wheat, and had collected in the Royal Gardens upwards of nine hundred varieties and sub-varieties.

He came to Col. Le Couteur's farm, and picked out more than twenty sorts out of three fields, then (in August) growing; and gave daily all the instruction and information wanted by Mr. Le Couteur, who resolved on profiting by such an opportunity, and began seriously to cultivate the important plant of wheat, so as to procure the several sorts distinct from each other, and keep notes of the experiments made on the culture, produce, weight of the grain, and qualities of the corn, flour, and straw.

Colonel Le Couteur has kept a most minute account of his experiments, and taken the greatest care to preserve the best sorts and in their purity. He has in London nineteen varieties of the greatest beauty, and such as the frequenters of Mark-lane say could not be matched in England for purity. They consist in,

No.

1. White Compact. Tremois, or Spring Wheat
2. Red Tremois, or ditto.
3. Long eared ditto.
4. Dantzic.—Winter Wheats. Triticum Hybernium.
5. Small round ditto.
6. White Seedling. Coturianum Hybernium.
7. Kœleri Loturianum.
8. Kœleri Red.
9. Kœleri White.
10. Long-eared Liver-coloured.
11. Red compact.
12. Golden.
13. Kœleri Compactum Belvuensis.
14. Cesariensis.
15. (No. 6. c.)
16. Red ear (white Grain or Sark Wheat.)
17. Red compact. (No. 9.)
18. Kœleri (sub-yellow).
19. (No. 11.)

The Colonel, after three year's experience, has arrived at this conclusion, that the proper cultivation of wheat is yet unknown or unpractised.

That it is of consequence to keep the several sorts to grow apart, because they all ripen at different periods; and that bread made of ripe and unripe corn could neither be so wholesome or nutritious as when made of ripe corn, without the mixture of that which had not well ripened.

That each sort requires, or will thrive best in, a particular soil and situation adapted to each.

That one ear of a superior variety, sowed grain by grain and suffered to tiller apart, produced four pounds nine ounces of wheat.

Whereas, another ear of an inferior sort, treated in the same manner, produced only one pound thirteen ounces.

Hence it is of importance to select the sorts that are the most farinaceous and productive.

That by sowing each sort apart they might be easier saved and harvested in rotation, some sorts ripening a fortnight before the others.

The same quantity of wheat of a farinaceous kind may maintain a family of fifteen persons twelve months; where the same quantity of another kind, though

apparently fine corn, will maintain them only nine months.

From the superior soil and climate of the Channel Islands, Col. Le Couteur thinks that, by growing none but the best kinds and keeping them perfectly true and pure, the Islands might be made to produce the most approved seed-corn for Great Britain.

The Islands might thus become of the greatest benefit to the United Kingdom, and can never be objects of jealousy, as to the fear of large importations from them, since the extent of all the land susceptible of cultivation in all the Channel Islands together does not much exceed 25,000 acres, and that the greater part must necessarily be occupied by the meadows, orchards, and vegetable gardens of all sorts, absolutely necessary for a population of more than sixty thousand inhabitants.

## FLAX TRADE.

In consequence of extreme scarcity and high price of this article, an unusual quantity of flax dressers are thrown out of employment, and flax has been sent from hence not only to the English, but also to the Irish markets from whence it came, to meet a better price. The prospects of the new growth in the above countries are flattering, but we must wait for supplies until the farmers have gathered their harvest, and get their seed into the ground. The prospects from Russia, we regret to say, are very poor indeed; the following is an extract of a letter from a most respectable house in St. Petersburg:—

"St. Petersburg, 5-17 July, 1835.

"The Flax brack has now been going on for a fortnight, and we are sorry to say that the quality is, on the whole, about the worst we have ever seen, it being generally short, weak, towy, foul, and not entirely free of black speck, though not much of the latter; the greater part must go into 6-head, though the Russians say there should be half of each, 9 and 6-head.

"The above defects are particularly applicable to the 6-head, the quality of which varies so much that we have seen a difference of £3 to £5 per ton, in some parcels of 6-head, as compared to others. Of 9-heads we have seen some very fair parcels of fine colour, indeed we should estimate the difference in value between the best 9-head and the lowest 6-head fully £10 per ton, instead of £3, which was usually made. The colour of the 6-head is likewise much against it, being very dark.

"The prospects of this year's growing crop are very bad, owing to a long continuance of hot weather, without a drop of rain for upwards of six weeks."

SALE OF MR. DOWKER'S STOCK OF RAMS.—The unrivalled stock of rams, late the property of G. W. Dowker, Esq., bred on the far-famed Salton estate, (advertised for sale,) were brought to the hammer, by Mr. Chapman, on Monday, August 3rd, and realized the following prices:—

|                        |      |   |   |
|------------------------|------|---|---|
| 39 Shearlings . . .    | £408 | 0 | 0 |
| 20 Two-shear . . . .   | 199  | 4 | 0 |
| 32 Three-shear . . . . | 236  | 3 | 0 |
|                        | £843 | 7 | 0 |

There was cut last winter, from one acre of land in the Taunton and Rainham tract, state of Maine, 227,000 feet of timber. The tract was sold within three years at the rate of two dollars per acre!

## TURNIPS ON STUBBLE.

[It is in seasons like the present when the main crop of turnips has suffered from the drought, that an extensive breadth of stubble turnips becomes invaluable. The favourable advent of rain with the earth in its now heated state, would ensure a good crop. We therefore invite the attention of our readers to the following article upon the subject, from the Irish Farmer's Magazine.—Ed. F. M.]

There has been a practice prevailing for many years in some of the best farming districts in England, of sowing turnips on wheat stubble when the land is sufficiently dry to allow the crops to be eaten off by the sheep, and in many instances I have seen excellent ones produced, even sown as late as the end of August. The white Stone is cultivated for this purpose generally, as it stands the frost better than the red or white Norfolk, and is altogether more suited to late sowing than any other sort. One deep ploughing is sufficient for this purpose, which, with the assistance of the scarifier and the rooler, the surface can be brought into fine tilth for harrowing in the seed. I see no reason why this system could not be introduced into Irish agriculture; for although our wheat harvest is usually a fortnight or three weeks later than it is in parts of the sister country, yet, the mildness of our autumn and winter would generally insure a continuation of growth in the turnip crop until Christmas, although the seed might not be deposited as early as could be wished. But this inconvenience even could be remedied by having some ashes, bone-dust, or other stimulating manure, ready to be harrowed in at the time of sowing the seed, which would materially promote the vegetation of the plants.

The expense of obtaining this crop is very trifling, for the land in any case, should be ploughed for winter's fallow, especially if intended either for barley or potatoes; therefore, the only extra expense would be the seed and preparing the land for it, which would not cost altogether more than ten shillings an acre; and should the crop succeed it would prove worth five or ten pounds an acre, all matters taken into consideration. Turnips after stubble (commonly called brush turnips) should always be fed on the land; and if this is managed judiciously in the months of February and March, when green food is scarce, the crop will turn to most valuable account. Ewes and lambs can be supplied with nutritious feeding from the tops, and by turning in dry cattle to eat the refuse bulbs, so as to clear the field ready for ploughing, it will forward them much in condition, by which they will become early beef. There is no danger to be apprehended from the cattle eating the turnips on the land, if attended to the first few days, the herd being in possession of the *proper* instrument for passing any piece that may stick in the passage. Many accidents happen, however, from a stick being used for this purpose; for if the gullet is injured in the operation, inflammation will take place, which will probably cause the death of the animal. If the piece has stuck near to the swallow, it is better first to endeavour to get it *up*, which sometimes may be effected by rubbing the hand gently *up* the windpipe, or by a person with a small hand and arm laying hold of the piece, and bringing it away. An accident however of this sort is not likely to happen where cattle get accustomed to feeding on turnips, and seldom proves fatal when properly attended to.

It is of little use to sow turnips on stubble, unless the land is in good condition and clear, for on poor land the crop would be but indifferent; and if foul, the opportunity would be lost of cleaning it until the following spring; and under such circumstances, it would be preferable to throw it up, in furrows to sweeten in the winter, and to get rid of the weeds as early the following year as possible. On light soils, however, if free from weeds, rape may be sown at the rate of three pounds to the acre, which would afford wholesome keep for ewes and lambs in a scarce season; and the land will give better turnips or potatoes the following year than had it remained in winter fallow; for independent of the manure deposited in feeding the crop, the roots of the rape plants when ploughed up can be converted into active manure, either by burning or ploughing them deep into the land, for the benefit of the succeeding crop.

Turnips sown so late in the season are seldom attacked by the fly, but a small proportion of rape seed being sown with the seed, will be a great means of preventing any material injury by this insect to the general crop. Some farmers do not hoe brush turnips; but I have always found great advantage in doing so, the crop afterwards proving more productive and the land in better condition the following year. Indeed my opinion is, either not to sow this crop, or to manage it in every respect in the best manner, for at so late a season, every stimulus will be necessary to bring it into active vegetation. Turnips will also succeed well after vetches, either on sandy, gravelly or loamy soil, and may be put in after one ploughing; and as this latter crop is usually soiled off by the end of July, it is the best season for growing the red or white Norfolk. These will likewise succeed well after grey or white peas, but the land should first be well worked and manured, otherwise a remunerating crop could not be expected; and this would be a better system than that usually practised in many parts of Ireland, of sowing wheat after peas, and would pay better even the first year. In fact, he is a bad farmer who does not take every opportunity of introducing a green crop in his rotations; for it is by such management he will keep his land in a fertile state at the least possible expense.

Although turnip seed is not usually drilled on stubble land, yet if pulverized manure, such as ashes, bone dust, or rape cake can be obtained, it is better the seed should be deposited with a machine made for this purpose, which gives out the manure at the same time, exactly in the drills where the seed is sown. If such machines cannot be procured, narrow drills may be opened at fourteen\* inches distance with the horse hoe, the pulverized manure then sown by hand on them; after this the turnip seed, and the land may then be levelled with the light seeding sowing harrow. This will cover the seed effectually in the very body of the manure. When the plants are in the rough leaf, the superfluous ones should be cut out, and the remainder left at four or five in-

\* This narrow distance is only to be observed when the roots are not expected to grow large, which will be the case when the seed is either sown too late, or the land is not in good condition. Crops sown early on a well prepared fallow, it will be necessary to keep the intervals of from twenty-four to thirty inches distance, and the plants not allowed to stand closer than ten or twelve in the drills. Swedes especially require ample space, and as much cultivation during their growth as possible.

ches distance in the drills ; and if the intervals are worked with the horse hoe or scarifier in two or three weeks afterwards, the growth of the plants will be materially promoted. The hand hoe should likewise be used to get rid of such weeds as the horse hoe cannot eradicate. I have often seen a crop of turnips after peas or vetches, full as productive as if grown on a regular fallow ; and even if a crop of brush turnips after wheat was to return half such a crop, the farmer would be amply recompensed for his labour. AGRICOLA.

### ABSTRACTION OF A PORTION OF OMENTUM FROM A COW.

BY MR. R. THOMPSON, BEITH, N. B.

(From the Veterinarian.)

A cow having got a push from another upon the side of the belly, so as to divide the muscles but not the skin, suppuration commenced some time afterwards, and the integument gave way. I received orders to attend the animal, as "her puddings," they said, "were coming out." I examined the protruded portion, which really seemed like intestine, and being dead, and decomposed, I pulled it away. It was a portion of omentum, about fifteen inches in diameter.

By introducing my fingers I could feel the intestines perfectly distinct. The injured portion had been divided by suppuration and sloughing. The cow perfectly recovered.

METHOD OF GROWING AND MANAGING STRAW-BERRIES AS PRACTISED IN AMERICA.—The plants are placed in rows on beds, as usual, but during the fruiting season the surface of the ground between the plants is covered with tanner's bark to the depth of three or four inches. This coat of bark defends the roots from being hurt by the sun's heat, and prevents the runners striking into the soil ; the bark also reflects the heat of the sun very powerfully upon the ripening fruit, and thereby expedites their swelling off. The bark should not be used for this purpose until it has been at least one winter out of the tan pit, as recent bark contains too much astringency to be suitable.—*Paxton's Horticultural Register.*

SINGULAR FEAT IN MOWING.—In the year 1779, eight brothers of the name of Wright, who resided in the neighbourhood of Flaxton, near Lobster House, cut twelve acres of good grass, in one day, at the former place, for which they received a premium from the agricultural society. One of them, at that time, was only 15 years of age, and he is now living at Warthill, and though in his 72nd year, he has this season walked a distance of six miles to the field, and in one day cut an acre and a half of good grass, which weighed a ton and a half, walking six miles home again at night.

Papera from the Mauritius to the 3d of April have been received. The cattle throughout the island had been afflicted with a new and singular disease, which carried them off so rapidly, that the Governor had issued a proclamation, desiring all persons whose cattle were attacked in this manner to make immediately a minute statement to the authorities of the appearance and progress of the disease, that measures might be taken to arrest the mischief which the colonists were likely to sustain. All cattle dying in this manner were ordered to be instantly burnt.

### TIMBER WOODS EXONERATED FROM THE POOR-RATES.

It is fit every one who enjoys his share of protection, should pay out of his estate, his proportion towards the relief and maintenance of the Pauper Poor: nothing can be more reasonable, than that a revenue which owes its existence to the good government of the state, should be taxed peculiarly something more than the greater part of other landed property, towards the support of this oppressive burthen. By the 14th Elizabeth, cap. 5, power was given to the Justices to lay a general assessment, and that authority has continued ever since, with the exception of Timber Woods, which have been always exonerated.

And from no attention having been paid by the Legislature to annul that exemption, the evil is become of great magnitude, and every day renders the cure more desirable ; and if made effectual, it would tend much to allay the popular clamour and discontent. The right of taxation of this wealthy property, with regard to the support of the Pauper Poor, is a point which none but the Woodland Proprietors dare to dispute ; for this reason—since the Poor-Rates were first established, the constancy of the valuation of Timber, with its annual growth, has been of a considerable advantage to the landlords, hurtful to the tenants, unjust to the rate-payers, and injurious to all Woodland Parishes. It is a great negligence, which all administrators have shown, towards any legislative means of repealing this parochial privilege—the complaint is not more publicly known than universally lamented ; in common justice, growing Timber, that yields an annual increase, no matter in which way the increase is produced, whether in the growth of the timber, or in price, it signifies not a straw, as it is tantamount nearly to the same end—at any rate, it is an annual gain ; therefore it can make no difference to the grower, whether he cuts down his Timber this year, or in five years hence—it still yields an annual and visible gain during all that time.

It is worthy of note, that this wealthy property is rated towards the repairs of the Highways, and exonerated from contributing to the relief of the Poor—the difference between the two is inconsistent and absurd.

And besides, Timber Wood creates no expence to the landowner, in its growth or preservation ; and though a small part of the Woodland revenue is necessary to be taken, in order to participate towards this national burthen, no discouragement will thereby be given to any sort of industry, or lessen its consumption.

It is admitted, and too notorious, that those who pay the far greater part of the Poor Rates, and labouring under great privations, and great injustice is felt by them ; therefore it is nothing but reasonable and just, that this privilege of exemption should be annulled altogether ; there, I apprehend, can be no second opinion as to the first remark, and consequently the second follows as a matter of course.

Landlords who are occupiers of Woodlands, are paid for the preservation of this property. Is it fair, is it just, that I, the Farmer, who pay more Poor Rates than them, should pay this tax, for the protection of their, my neighbour's property ? but this is the fact—the Farmers do pay for the protection of this description of property ; it is an assessment, which, in effect, is nothing more than the Tenants paying for the protection of their Landlord's income. If an equal assessment was applied, the Farmers and other Rate-payers would not pay for the Woodland,

nor would the Woodland Owners pay for the Farmers ; the growers of Timber would only pay for their own protection ; and where is the evil of this ? who can object to pay for the protection of his own property ? and who so capable of bearing taxation as those who possess large domains of landed property ? But who are the promoters of this exemption ? why, the Woodland Proprietors ; these are the very men who support the measure. They reason thus—" We have hitherto had our property protected by the State, let us continue to enjoy this privilege."

It would be needless in representing the grievance of this unrated property to any honourable Member of Parliament who is a Woodland Proprietor, for no one would be disposed to legislate against his own interest ; and notwithstanding this objection, without the assistance and means of some competent and unbiassed Legislator, the existing evil will never be cured. Nothing would be more just, nothing more popular, than to impose a proportionable, or an equitable Poor Rate upon all description of Timber Woods.

In conclusion, from what I have here stated, should any good arise to the agricultural interest, and consequently to all Woodland Parishes, which must in a great degree be benefited, I shall feel particularly grateful, by my humble endeavours having answered some good purpose, in aiding and extending the views of every Woodland Parish, and promoting a general benefit, which, I flatter myself, may be derived by the public in general.

A FARMER.

## HARVEST SONG.

BY JOHN LUKE CLENNELL, ESQ.

(From the New Monthly Belle Assemblée.)

Rise, lads, rise !

Salute the first approach of breezy morn ;—  
Prepare your sickles, and with songs of mirth,  
Go forth, and strew the sheaves upon the earth ;—

'Tis time that we should cut the rich ripe corn !

Come, lads, come !

And follow me across the dewy grass ;  
Come from your dwellings by the mountain side,  
Come from the valley where the streamlets glide ;—  
We must not let another sun-rise pass.

Work, lads, work !

The sturdy reaper shall be well repaid,  
And never shall his strength or spirits fail,  
For lack of foaming draughts of sparkling ale,—  
That pleasant drink which is from barley made !

Sing, lads, sing !

The toil and labour of the day are o'er ;  
Come and recline beneath the spreading tree,  
And let the universal chorus be,  
" The bounteous goodness of the Lord adore !"

The month of July was one of the most dry and scorching months experienced for some time. On the 30th the thermometer reach 93 degrees Fahrenheit, being the highest point this summer; the whole variance during the month in the extreme heat of the day in the shade was between 69 degrees and 93, and the lowest point during the month in the night was 52 degrees. Last Thursday night the thermometer did not sink below 64 degrees.

[The following Petition was presented to the House of Commons on the 3rd of August, by Mr. Collier, Member for Plymouth].

To the Honourable the Commons of Great Britain and Ireland, in Parliament assembled.

The petition of the undersigned merchants and importers of foreign wheat and flour at Plymouth and London, and others interested in the trade and shipping, respectfully

SHEWETH,

That your petitioners have, in the regular course of their business, imported into this country, principally in the years 1832 and 1833, considerable quantities of wheat and flour, in the full expectation that they might be wanted to supply that deficiency in the growth of this country, which, on an average of years, had been always found to exist.

That owing to the increase of the growth of wheat in the United Kingdom, in consequence of more land having been cultivated, and our having had four productive crops of wheat in succession, the two last uncommonly so, it has been found, contrary to all former experience, that the produce, aided as it has been by increased importations from our own colonies, allowed to be imported at a low duty, has been equal, or more than equal to the consumption.

That the last time the price of wheat was sufficiently high to allow of the duty being paid on it to any extent, was in 1831, since which the stock has been accumulating, and the quantity of foreign wheat and flour in bond (exclusive of the produce of the British Colonies), in the United Kingdom on the 5th of June, 1835, was

|                                            |            |
|--------------------------------------------|------------|
| Wheat, 586,685 qrs, which at the value of  |            |
| 35s per qr, amounts to .....               | £1,026,698 |
| Flour, 207,177 cwt. or 118,380 barrels, at |            |
| 26s .....                                  | 153,902    |
|                                            | £1,180,600 |

That in consequence of this almost unprecedented state of the trade, a large amount of capital is locked up in an unproductive state, not only to the great loss of your petitioners in interest of money, warehouse rent, expense of turning, and deterioration in value by keeping, amounting in some cases to nearly, if not full the present value of the same, but, as your petitioners conceive, to the disadvantage of the public generally, including the agricultural interests, for the protection of which the corn laws were enacted—for it is evident, that as the holders of bonded wheat and flour are chiefly corn merchants and millers, whose capital, now locked up, would be invested, were it liberated, in British wheat, to which its present low price offers a great inducement, the value of English wheat would be increased by the exportation of flour made from foreign wheat.

Your petitioners respectfully represent that an unlooked for opportunity now offers for relieving them from the pressure under which they are labouring, and that, not only without injuring the agricultural interests, but would materially benefit them.

Advices have been received in this country, that the wheat crop in the United States has been materially injured by the uncommonly severe winter, in consequence of which the prices of wheat and flour have advanced in the markets of that country so much above the prices of foreign wheat in England, that we could supply the demand on much lower terms. They export from thence, annually, about 1,000,000 barrels of flour, (in the year 1831, it was upwards of 1,800,000 barrels,) chiefly to the West Indies and South America ; and it is evident, that not only in the event of any considerable falling off in the means of continuing that supply from America, but under any circumstances, the merchants and millers in this country have it in their power successfully to compete with those of the United States.

This then offers at once a market for a portion, if not the whole of the wheat in bond ; and your petitioners

conceive that they have a fair claim on the legislature to allow the said wheat to be ground into flour for the purpose of being so exported.

Under somewhat similar, though less pressing, circumstances than the present, on the 17th June, 1824, an Act was passed (5th Geo. 4th Cap. 70) to permit wheat to be taken out of bond, ground into flour, and returned into bond for the purpose of being exported, which was then found to be a great relief to the holders of foreign wheat, and your petitioners trust, that an enlightened and increasingly liberal legislature, will not hesitate to act on a precedent, at once just and humane: for it is evident with the present prospect of another abundant crop, in addition to an unusually large surplus on hand, if the wheat and flour now in warehouse be not permitted to go into consumption, not only will the loss be greatly increased by the charges already enumerated, but the quality will be more rapidly deteriorated, and the quantity lessened, by being kept longer in warehouse.

Your petitioners also submit, that the holders of flour in bond may be relieved by a mode similar to that proposed for wheat, viz: by allowing the usual quantity of biscuit to be returned into bond in lieu of flour, for the purpose of being exported, which, from the age of the flour, is unfit for loaf bread purposes, and for biscuit, would require a portion of fresh English meal to be mixed with it, thus rendering it equal in quality to the biscuit supplied for the use of the British navy, a comparison with which might constitute the test. The produce of biscuit is at the rate of 176lbs. for 196lbs. of Flour.

Your petitioners therefore respectfully, but earnestly petition the legislature, with all possible dispatch, to pass a short Act, allowing the foreign wheat now in bond to be ground into flour, under similar provisions to those of the 5th George IV. herein before referred to; and also in like manner to permit the flour now in bond to be made into biscuit, for the purpose of exportation only.

#### The Answer of the Right Honourable, the President of the Board of Trade, to the above memorial.

"That the advanced stage of the present Session, when many Members of Parliament had gone into the country, not expecting any new measure would be brought forward, it would not be considered as acting fairly, were Ministers now to agitate any question relating, however remotely, to an alteration of the existing Corn Laws.

That the act before alluded to by the memorialists had not been found a perfect security against fraud, and that the landed interest looked with much jealousy and suspicion upon insulated enactments of this nature.

Though the Right Hon. President did not offer any arguments against the principle of the measure submitted to his consideration in the memorial, yet he intimated that he should not feel it his duty to recommend his Majesty's Government to agitate this question during the present session.

The Deputation stated in reply, that there had been but one case of fraud discovered during the operation of the Act referred to, and proposed the appointment of a select Committee of the House of Commons, to investigate the subject, which the Hon. President also declined to support."

The following letter, referring to the answer of the President of the Board of Trade to the Memorial of the merchants, and importers of foreign wheat, given above, appeared in the Public Ledger.

TO THE EDITOR OF "THE PUBLIC LEDGER."

SIR,—The above answer is not given in the unknown tongues. It is plain English, and an honest confession,

which being interpreted, means "That having the fears of the landed interest before our eyes, we dare not do you that justice which we think your case merits." So much for the British administration in the year 1835. The only real objection to the prayer of the petition is the jealousy with which the landed interest views any change in the state of corn laws.

Now, Sir, there is no change demanded, and under the circumstances of the case, I do think that no government is justified in refusing to grant the request—not as a favour but as a matter of right.

The facts of the case are, that upwards of 600,000 quarters of foreign wheat are now in granary, under fearful expenses, without prospect of release save by the granting the prayer of the petition, or by the help and assistance of the *weevil*, which insect is now doing its duty on it, silently but quickly, so that absolute and total loss stares the holders in the face—and this to the extent of upwards of one million of pounds sterling.

Now it so happens that a failure in the crops of the United States of America has occurred, and that the West India and South American markets are forced to resort to Europe for the supply usually received from thence. The exports from America annually exceed one million, and have reached one million eight hundred thousand barrels of flour.

The Continent of Europe can furnish this supply much cheaper than this country can do with produce the growth of Britain.

But Great Britain could furnish as good an article from the produce of wheat in bond, at ten per cent. cheaper than the Continent of Europe can do and upwards.

The prayer of the petition from Plymouth goes no farther than this, "That permission be granted to have the wheat in bond converted into flour, and that flour partially converted into biscuit, under security that the whole produce shall be again placed in the stores of government and then be exported."

The owners of wheat have the right of exporting it as wheat; but this will not answer the purpose—it is flour and bread that is wanted.

I must beg of you to bear in mind, that the relative value of wheat, the growth of Britain as compared with that of the European Continent, is a *prohibition* to the supply needful being furnished from this country's produce; and taking this as a foundation I would argue, that with as much justice might government prevent exertions being made to preserve bonded wheat from the effects of accidental fire, as they can now do away with the only resource by which upwards of one million of capital may be preserved to the subjects of this country. The cases are very nearly parallel, for in point of fact, to fire or to water the wheat must in reality come. In a year or two more the *weevil* will render the grain worthless, and the choice remains of throwing it into the sea or to consume it by fire, so as to cancel the bonds passed by the unfortunate holders to his Majesty's government for the amount of duty.

Now, Sir, this statement of facts must appear to you monstrous, nay, absolutely ridiculous. Plain facts they are, however, and by no means exaggerated; and we must glory in living under the paternal affection that any government must have for its subjects, where it casts the tide of commerce from its own shores to those of a stranger, and at the same time forces our own colonies to purchase the necessities of life at a rate much higher from foreigners than our own merchants could supply their wants at home, and when the doing so would be to save to them the entire value of the article furnished, where no possible interference with the protection afforded to the landed interest by the corn laws can take place, but on the contrary, an immense capital be released, of which they would have the benefit. I will say nothing of the advantages which those countries derive from whence the supply of flour is drawn, by the consequent export of other stores necessary both for colonies and shipping, but I do say that unless the assertions made can be controverted, the refusal to grant the prayer of the petition appears to me as passing strange.

I address myself to no party; I would appeal to the common sense and equity of Parliament; it is the cause of justice, and to render justice in the house is equally the prerogative of all. *But the relief, if granted, must be promptly granted, or the opportunity will be lost.* Why permit jealousy to interfere with justice? British produce cannot be appropriated, then why should the landed interest stand still like the dog in the manger facing their brother subject saying, "If we cannot have the benefit, neither shall you."

Mark-lane, August 12, 1835.

### MONOMANIA IN HORSES.

The following curious facts are extracted from a paper by Professor Rodet, in 'The Veterinarian,'

"In 1806, during the campaign of Austerlitz, a Piedmontese officer possessed a beautiful, and, in other respects, a most serviceable mare, but which one peculiarity rendered at times exceedingly dangerous for the saddle. She had a decided aversion to paper, which she immediately recognized the moment she saw it, and even in the dark if one or two leaves were rubbed together. The effect produced by the sight or sound of it was so prompt and so violent, that in many cases she unhorsed her rider; and in one case, his foot being entangled in the stirrup, she dragged him a considerable way over a stony road. In other respects, this mare had not the slightest fear of objects that would terrify most horses. She regarded not the music of the band, the whistling of the balls, the roaring of the cannon, the fire of the bivouacs, or the glittering of arms. The confusion and noise of an engagement made no impression upon her; the sight of no other white object affected her; no other sound was regarded; the view or the rustling of paper alone roused her to madness. All possible means were employed to cure her of this extraordinary and dangerous aberration, but without success; and her master was at length compelled to sell her, for his life was in continual danger.

"A mare belonged to the Guard-Royal from 1816 to 1821. She was perfectly manageable, and betrayed no antipathy to the human being, nor to other animals, nor to horses, except they were of a light grey colour: but the moment she saw a grey horse she rushed upon it, and attacked it with the greatest fury. It was the same at all times and every where. She was all that could be wished on the parade, on the route, in the ranks, in action, and in the stable; but such was her hatred towards grey or white horses, that it was dangerous to place them in the same stable with her, at whatever distance. If she once caught a glimpse of one, whether horse or mare, she rested not until she had thrown her rider, or broken her halter, and then she rushed on it with the greatest fury, and bit it in a thousand places. She generally, however, seized the animal by the head or by the throat, and held it so fast that she would suffocate it if it were not promptly released from her bite.

"As she grew old (for she was eighteen years old in 1821), this mania was not quite removed, but it was somewhat weakened. No other body of a white colour appeared to make the least impression on her.

"A mare, belonging to the fifth squadron of hussars, feared, on the contrary, all white inanimate objects—such as white mantles or coats, even the sleeves of shirts and chemises too much displayed, and particularly white plumes. When any of these white bodies, and especially in motion, were suddenly perceived, if they were of any magnitude, and their motion was rapid, she was in a dreadful fright, and strove to escape; but if they were of no great size, and moved more gently, she rushed furiously upon them, struck at them with her fore-feet, and endeavoured to tear them with her teeth. No other colours produced the slightest effect upon her, nor did the appearance, however sudden, of white horses or dogs of the same colour; but if a white plume waived, or a white sheet of

paper floated by her, her fear or rage was ungovernable.

"These three cases of singular and particular aversion, possess, in my mind, all the characters of true monomania."

### LINES,

SUGGESTED BY AN OLD WRETCHED-LOOKING HORSE,  
SEEN IN THE VICINITY OF TOWN.

*From the New Monthly Belle Assemblée.*

Alas! poor Horse, and can it be  
That thou art left to die?  
That he whom faithfully thou hast serv'd,  
Heeds not thine agony?  
To have given thee an easy death  
Had been an act humane;  
But thou art doom'd to linger on  
In misery and pain!

Oft-times and willingly thou hast toil'd  
Thy master to obey;  
Unmindful of the scorching sun,  
Thou hast borne him on his way,  
And if impatient of thy pace,  
He used or spur or whip,  
Subservient to his mighty will,  
Meekly thou did'st submit.

And *this* the fruit of service past!  
Now thou art left alone,  
Half-starved thy mien, and tired thy feet,  
How piteous is thy moan?  
Oh! fallen man's estate indeed,  
If he relentless sees  
The beast to whom he owes so much  
Perish by slow degrees!

Sure he forgets how much he needs  
That mercy he denies;  
Or he would quickly haste to free  
The sufferer ere he dies!  
For fearful is the wrath of God,  
Whose eye his deeds will scan;  
Since he ordain'd beasts for the use,  
And not abuse of man.

HUMANITAS.

SUPPLY OF WATER.—In consequence of the continued drought, most of the wells at East Bourne have long been dry, and eleven paupers daily employed in fetching water from a spring, a mile and a half distant; this led to the vestry digging a tank to receive rain water, which is to be ten feet in diameter, and 20 feet deep, cased with a flint wall, nine inches thick, laid in grey lime mortar, to rest solid against the sides, in consequence of being rather less at the bottom than higher up, like a decanter, and is to be domed over, as several tanks already made in the parish on the Egyptian plan of projecting each row of materials horizontally one third of their length over those under them, till they meet at the top; the stones are kept firm in their places by being wedged in by earth at the back of this contracting masonry, which is executed at 10s per hundred, as is charged for building field walls, only requires after it is finished a coat or two of plaster. A tank of 12ft by 7ft is made of four and half inch brick, which is invaluable to the possessor now that his home well is exhausted, (July, 1835) and that the only stream in the parish of East Bourne has not reached the sea for ten months. As two feet of water fall on an average annually in England, no family need want good soft water, who make a tank to retain the rain falling on their houses, and if such tanks are under the yard, they take up no room, and need no repair like the water casks now commonly used; and cattle may also be easily

supplied with water, wherever good strong mortar is to be had, or Parker's or Roman cement, as the pond on the summit of the hill above the church at East Bourne shews, where on the 20th July, although there is no spring, and from its situation no water could run into it, except what falls on the surface, good water was found, which, by pacing, measured upwards of 90 feet round, that is 30 in diameter. The pond itself was dug four feet and a half below the surface, and what was excavated was added to the sides, making a diameter of 150 feet, of which only about seventy feet in the centre was made like a basin to retain water, by flints and grey lime water, thick enough for cattle not to break through, which was understood to be like a road one foot thick.—Had such ponds been found this year in Romney Marsh, the famished sheep need not have been, as it is said, literally given away.—July 29, 1835.

## TICKS, FLEAS, AND LICE IN DOGS.

(AN EASY AND EFFICACIOUS MODE OF DESTROYING THEM.)

(From the Sportsman.)

It frequently happens that very important remedies are neglected because of their simplicity; they are cheap, easily available, and therefore no confidence is placed in their efficacy. We have often experienced difficulty in prevailing upon a gamekeeper to use common, raw, linseed oil for the destruction of ticks. In the year 1832, Billington, gamekeeper to Charles Blundell, Esq., of Ince, Lancashire, was sent to us by his master for the purpose of ascertaining the most effectual method of destroying the vermin in question; and when we informed the block-head of our simple remedy, he appeared so incredulous that we were in doubt whether he would resort to it, although one of his master's pointers had absolutely been "eaten to death by ticks." The fact is, that linseed oil, so simple an element (or compound?) operates as the most deadly poison upon ticks, fleas, lice, and, we are inclined to think, upon all the insect and vermicular tribes. The common fly, so tenacious of life, cannot withstand the application of linseed oil: if the head of a pin be dipped in the fluid just mentioned, and applied to the head of a fly, it will struggle hard for some seconds, perhaps a minute or two, and then expire.

At this period of the year dogs are subjected to those vermin which we have mentioned above; and, as far as relates to ticks, it is astonishing in how short a period they will destroy life. Ticks adhere so tenaciously to the skin of the dog, that they cannot be removed with a currycomb or any kind of comb; and therefore when the oil is applied for their destruction, the hair should be turned the reverse way, and the oil well rubbed, or rather *scratched*, in with the hand; in which case, the ticks will be extirpated in twelve hours.

For the destruction of fleas, linseed oil is equally effectual. The remedy should be administered repeatedly during the summer—as often, in fact, as the animal is troubled with fleas: none will be found while the moisture of the oil is perceptible on the dog's coat; but in hot weather they will frequently re-appear.

**A LIQUEUR MADE OF FOUR RED FRUITS.**—Take scarlet strawberries, raspberries, currants, and morella cherries, as they ripen in succession. Extract the juice from them separately, and add to it a small proportion of white sugar candy, so as to make it sweet and rich, but not a thick syrup: strain it off as clear as possible. When you have the juices of the four fruits ready, mix them together, observing to put in a smaller proportion of currant and raspberry juice, than of the cherry and strawberry. To a pint of juice add a gill of brandy, and then bottle it. The addition of some cherry and apricot kernels will be found a great improvement. The fruit ought to be picked in very dry weather.—*Magazine of Domestic Economy.*

## BONAPARTE AND MR. SINCLAIR.

The following anecdote alike creditable to both the parties concerned, is related in a work entitled, "Journal of a Nobleman at the Congress of Vienna."

The writer being asked, "But what has become of the young Englishman, Mr. Sinclair, whose adventure with Bonaparte excited so much interest in Vienna?"\* replied, "I have not seen him since we parted here; but Lady Davy, whom I met last year at the palace of the Archbishop of Tarentum, in Naples, informed me that he is now a Member of the English House of Commons, and a distinguished speaker on the opposition side."

\* Shortly before the battle of Jena, Mr. George Sinclair, on his way to Vienna, was arrested by some French scouts, and conveyed to the head-quarters of the French army. "Whence do you come? and where are you going?" inquired Bonaparte, in that tone of voice, which usually preceded a sentence of death. "I have come from the university of Jena," was the reply, "and am proceeding to Vienna, where I shall find letters and orders from my father." "And who is your father?" "Sir John Sinclair." "Sir John Sinclair?—He who writes on Agriculture?" "The same, Sire," Napoleon said something to General Duroc, and then continued his interrogatory in a somewhat milder tone. Mr. Sinclair, who was at this time scarcely eighteen years of age, joined to a prepossessing person a vast fund of information on geography and history, and was well acquainted with the genealogy of all the sovereign houses of Germany. His acquirements astonished Bonaparte; who after conversing with him for two hours, told Duroc to let him be escorted to the advanced posts, and allowed to continue his journey. This unexpected favour was the more flattering to Mr. Sinclair, inasmuch as he was indebted for it entirely to his own merit.

## HOPS.

**FARNHAM.**—A hop grower has remarked that if this crop was not a speculative one, it would not be worth the culture, thus mankind are fond of games of chance. That it is an uncertain crop, has indeed been proved this year, by the failure of even very good grounds in this place, the half of the plantations will not grow half the quantity of last year, the outsides and many detached pieces will scarce have 1 cwt per acre; it is only where there is a great depth of loamy soil that they put on any shining appearance; the chalk bottom, or subsoil, of the upper part, and the clay subsoil of the lower part of the town are this year uncongenial to the growth, the bine not being able to grow away, or overcome the vigorous attacks of the fly and lice, which together with the honey dew, has left the leaves and bine perfectly black. Of the environs of Farnham, there are partial spots, where the middle of the grounds will have a sprinkling, a half average crop, and this, in many instances, arises from the super-culture of the planters, at Hale, the intelligent cultivators fully appreciate the benefit of culture, and the encouragement to the other half of nature's works in the male plants so strenuously advocated by Mr. Lance in his works; and more may be seen on the north-east side of every such plant, its effects, from the south-western winds having wafted the pollen to that side. At Froyle, the advantage of culture are most surpassing, in the practice of Mr. Wm. Messenger, who not only cultivates his alleys during the winter, but has the horse hoe continually at work during the summer, even until the comple-

tion of the hop, thus making some, other ways uncongenial soil, successful for hops. In every instance where the horse hoe husbandry is energetically pursued, it succeeds, and nowhere around Farnham is it so emblazoned as at Frensham.

As a wheat soil, the Malm land of *Binstead* may be called the pride of Farnham market; and there may be seen some hop gardens, not to be despised, but cruelly injured by the growth of timber trees around them; the soil, (like some of the western counties), being so congenial to the growth of wheat and clever, is apt to make the wealthy yeoman careless of some other crops. As a character of this soil, it may be remarked, that the millers allow the wheat from it, to make the best flour; and as seed corn, farmers say thus it will produce a sack per acre more on a changed soil, than other corn. But of the hops, from which we have digressed, it should yet be borne in mind, that even now they that shew themselves, are not altogether safe, other casualties may arise. The Bob, (*Fly Haltica*), may yet play its part amongst the petals of the hop, and in hot weather they are very apt to do so; and should moist weather occur, the mould would blast the hopes of the hop grower, but as these, either of them, have not yet made their appearance, we shall not dwell on them, but should they occur, will refer to them and their physical history another day. The neighbourhood of Farnham is now in great trouble from the attacks of a black caterpillar on the common turnip, and in some instances they have attacked the Swedish bulb, in a very few days they convert a luxurious field of turnips into a bare piece of ground eating away all the fleshy parts of the leaves, and making them like a piece of lace work. Are they the larva of *Pontix Brasicae* or *Rapæ*? the second brood from the effects of this hot summer, they have not been observed at this season before for twenty years past; or are they the larva of *Papilio Plebeii* of Linnaeus? Some of your entomological readers will perhaps throw some light on this appalling visitation to our farmers. L.

Farnham, Aug. 13th.

## A CASE OF SUPERFETATION IN THE COW.

BY MR. W. COWELL, HATFIELD PEVERILL.

(From the Veterinarian.)

On Saturday, June 20th, 1835, about 6 P. M., a cow, belonging to Mr. B—, Woodhamwaller, calved a very fine living calf. The placenta following almost immediately after the fetus, and the cow was left until 9 o'clock, when, much to their surprise, a second calf was discovered, somewhat smaller than a hare. The cow did well. Not having seen any similar case reported either in your valuable periodical, or in any other work, I have been induced to send you this short history.

ENGLISH AND FRENCH FRUIT DESSERTS.—The more general use of dessert fruit among the middling classes is another requisite wanting for the improvement of horticulture in Scotland and Ireland. If fruit, physiologically considered, is less wholesome after dinner than before it (which is questionable), it is at least more so than where drinking is substituted in its place. To prolong the period of eating, and the conversation of female society, are not only objects which afford immediate satisfaction; but, by moderating the use of stimula-

ting liquors, tend to insure future health. Even in England, where a dessert is universal among the independent classes, there is a great want of nicety of taste: fruit is valued by many only as a symptom of the presence of wine: others contentedly use pears and plums that would be rejected at the most common French *déjeuné*; and many rest satisfied with melons and grapes, who, at scarcely any additional expense, might have pine-apples. Wherever the litter of four horses is at command, pine-apples may be grown in pits with very little trouble to the gardener, and, indeed, at much less trouble than very early cucumbers or melons. But why speak of pines, when not one family in a hundred is properly supplied with mushrooms, which ought to be on the table, in some form, every day in the year? On a small scale, the grand secret is to employ a gardener who knows his business: and to direct his attention less to raising ordinary productions at extraordinary seasons, than to raising first-rate crops of every thing in due season. On a larger scale, all ordinary and extraordinary things should be attempted that art and wealth can accomplish.—*Loudon's Encyclopedia of Gardening.*

## THE MALT TRADE.

Pontefract Brewery, Aug. 6, 1835.

SIR,—It appears to me that the importance of the malt trade in the Leeds district is completely overlooked. I send you the amount of the five highest collections in the kingdom, by which you will see Leeds stands the first; you have also three of the lowest. Your's, faithfully,

JOHN WADDINGTON.

### RETURN FOR THE YEAR ENDED APRIL, 1834.

IRRIGATION.—Irrigation is to be seen in its greatest perfection in Wiltshire; and it is worth any one's while, who takes an interest in agricultural pursuits, to travel many miles for the purpose of duly appreciating the unquestionable advantages and value attached to a water-meadow, and which many thousands of acres in other quarters capable of being irrigated, from not being in the situation of upland meadow-ground, are entirely deprived of, merely from the circumstance of their proprietors, or occupiers, or both, not being sufficiently aware of the vast benefits that may be derived from such a practice. In the month of April, the water-meadows will carry grass mid-leg high, which is folded off by the sheep and lambs as naked as possible; and the water being turned over again, they will, in the course of six or eight weeks, produce two tons of hay per acre. Not only this,—but between haying time and Michaelmas they will put beasts in good condition for stall feeding, and frequently entirely prepare them for the butcher. It may be fairly stated that one acre of water-meadow is more than equal to two of upland meadows.

From the deficiency of rain this year, and in fact the three preceding years, many of the wells to the depth of 16ft. have been dry for some weeks past; consequently much inconvenience has been occasioned in watering the cattle, for the want of pond and well water: and vegetation has in numerous instances, perished under the scorching rays of the sun.

SMALL ALLOTMENT SYSTEM IN  
RUTLAND.

On Wednesday the 22d July, Mr. Baker, of Cottesmore, entertained a select party of friends interested in the small allotment system. After assembling, as usual, at Cottesmore about eleven o'clock, they proceeded to examine the allotments, and then went forward to the Barrow allotments, the Earl of Lonsdale's and Mr. Baker's farms; and the Exton allotments, recently taken out of the Park for that purpose by that excellent patron of the system, Sir G. N. Noel, Bart., M.P.; returning to dinner at three o'clock. The several awards of the Judges were read over, which had been made on the three preceding days; much useful and animated discussion followed, and all were unanimous in opinion of the great importance of the allotment scheme, which has been acted upon in Rutland for some years, perhaps with a care and an attention unequalled, and the beneficial results of which have become apparent to every observer. Each succeeding year brings forth additional proofs of its utility, and ample testimony was adduced that the labouring class, generally speaking, were not only benefited by the good crops they had obtained, but their thankfulness, contentment, and improved moral habits surpassed the expectation of the most sanguine supporter of the measure; whilst in every field cultivated under this system, the land had improved in its productive powers.

The silver cup, value 10 sovs., given by Sir Gilbert Heathcote, Bart., M.P., to the tenant occupier of the best cultivated farm, &c., was awarded to Mr. John Christian, of Barrow, and will be presented to him at the meeting in September next, filled by his good landlord (the Rev. Henry Neville) with crown pieces; of which it is supposed it will hold from thirty to forty pounds' worth.—The following is the award of premiums:—

Premiums adjudged on Monday the 20th, Tuesday the 21st, and Wednesday the 22d of July, by Daniel Larratt, Esq. of Thurlby, Lincolnshire, and Samuel Cheetham, Esq. of Hambleton, Rutland.

## COTTESMORE.

1st prize.....to John Tyler..... 10s.  
2d ditto.....to Edward Young..... 7s.  
3d ditto.....to Michael Berridge..... 5s.

Given by the Rev. Henry Neville, for good cultivation.  
John Cramp (nearly equal to Berridge).—4s., by Sir G. Noel, Bart.

John Turner Widow Turner } commended by  
Widow Edwards Edw. Osborn } the Judges.—2s.  
John Plowright Widow Rawlins } each by Sir G. Noel,  
George Allett Thomas Stimson } for good cultivation.

*Under the 11th Rule*—"It is expected that every occupier shall attend some place of worship," &c.

William Chamberlain } 2s. each.....by Sir G. Noel.  
James Sneath }  
George Allett }

In 1834, Widow Turner produced on one rood, 14½ bushels of wheat, white chaffed variety.

## BARROW. By the

Rev. H. Neville. J. Himan. W. Tomkins.

1st prize..Francis Simons ..10s.....5s.  
2d ditto...William Huffill .. 7s.....3s.  
3d ditto...Ann Munton, } .. 5s.....2s.....5s.  
widow, aged 67 }

for good cultivation.

Henry Stubbs Wm. Letherland } Merit.—2s. each.  
John Letherland Thomas Sesson } by Sir G. Noel, Bart.

*Under the 11th Rule.*

John Letherland } 2s. each.....by Sir G. Noel, Bart.  
John Leeson }  
Widow Munton }

In 1834, Simons produced on ½ rood, 7 bushels 1 peck of wheat, white chaffed variety; Stevens 7 bushels of bearded or rivets wheat.

## WHITWELL.

1st prize.....Daniel Smith..... 10s.  
2d ditto.....Robert Allen..... 7s.  
3d ditto.....Robert Smith..... 5s.

By Mrs. Ellicott, sen., for good cultivation.  
— Bollands.—Merit.—3s., by Sir G. Noel for good cultivation.

*Under the 11th Rule, and for general good conduct.*

The ten occupiers recommended to Sir G. Noel's notice, 2s. each.

## EXTON.

1st prize.....James Speede..... 10s.  
2d ditto.....Thomas Bullimore..... 7s.  
3d ditto.....John Collin..... 5s.  
Matthew Weldon (nearly equal to the 3d)..... 4s.

By Sir G. Noel, for good cultivation.

Edward Cole John Scotney }  
Thomas Dawson Robert Hibbit } Commended by the  
Wm. Preston Thomas Wilson } Judges,—  
Wm. Shuter Geo. Woodward } 2s. each..by Sir G. Noel.  
Joseph Fant }

Great merit to all the occupiers.

## PICKWELL.

By Sir E. W. G. Noel, Wilmot, Esq.

1st prize..William Lane, aged 82 years,  
(Clerk of the Parish 5/1)—great merit..10s.....10s.  
2d ditto...William Allett..... 7s..... 7s.  
3d ditto...Edward Pears (Wm. Hayes  
being disqualified)..... 5s..... 5s.

for good cultivation.

Also to Wm. Lane, for good character.—5s., by Sir G. Noel.

The Allotments much improved.

## RIDLINGTON.

1st prize.....John Haines..... 10s.  
2d ditto.....John Barfield..... 7s.  
3d ditto.....John Dunmore..... 5s.  
Another competitor (nearly equal to Dunmore)..... 4s.

By the Rev. C. Swann, for good cultivation.

Russell, Edw. jun. } Merit.  
Wright, Wm. } 2s. each.....by Sir G. Noel.  
Manton, Wm. } for good cultivation.  
Pennystone, Fras. }

## NEW ALLOTMENTS.

1st prize.....George Webb..... 10s.  
2d ditto.....John Dunmore..... 7s.  
3d ditto.....Joseph Woodcock..... 5s.

By Sir G. Noel, for good cultivation.

Three other competitors, commended, 3s. each, by Sir G. Noel.  
*Under the 11th Rule, in both Fields, and for general good conduct.*

Win. Wright George Webb }  
Joseph Harris John Dunmore } 2s. each..by Sir G. Noel.  
Wm. Manton Jos. Woodcock }  
Jos. Barfield Robert Manton }  
Thos. Manton Joseph Bryan }

In 1834, Barfield produced 6 bushels 1 peck of wheat upon ½ rood, 50 bushels of potatoes upon ditto, and 4 bushels 2 pecks of peas upon ditto; Hames 6 bushels of wheat upon ½ rood.

## UPPINGHAM.—Rev. J. G. Dimock's Land.

1st prize.....Robert Stretton..... 10s.  
2d ditto.....Michael Cant..... 7s.  
3d ditto.....Geo. Nutt..... 5s.

By Sir G. Noel, for good cultivation.

## Sir G. Noel's Land.

1st prize.....A. Stretton..... 10s.  
2d ditto.....Thomas Nutt..... 7s.  
3d ditto.....John Page..... 5s.

By Sir G. Noel, for good cultivation.

Robt. Foster Thos. Chapman } Merit.  
Edw. Baines Thos. Trigg } 2s. each..by Sir G. Noel.

*Under the 11th Rule, and for good conduct generally.*

John Page John Mould } 2s. each..by Sir G. Noel.  
Wm. Baines Wm. Mould }

In 1834, Robert Stretton's ½ rood of wheat produced 5½ bushels, ½ rood of peas 4 bushels, ½ rood of potatoes 6½ quarters; Robert Foster 6 bushels of wheat, 62 pecks of potatoes, 70 pecks of green peas, and 3 pecks of ripe peas; Thomas Chapman 6 bushels and 1 peck of wheat, and 7½ qrs. of potatoes.

PARISH v. PARISH.—Comparative merits, quality of the land, situation, clean and useful husbandry,

general management, and the number of years under the system—awarded to Whitwell, it being the second year of tenancy, 2s. each to all the occupiers, by Sir Gerard Noel, Bart.

The Ransome prize of one sovereign to the occupier of the best cultivated allotment in any of the parishes,—awarded to John Tyler, of Cottemore.

## ON WEEDING LAND.

(EXTRACT FROM SINCLAIR.)

Among the perennial weeds affecting arable land, wild oats, thistles, docks, and coltsfoot, or tussilago, require particular attention.

The wild oat or oat-grass (*holcus avenaceus*) is a most troublesome weed to a farmer, and difficult to be eradicated. It formerly abounded so much in some districts, as to constitute almost one half of the crop. A farmer cleared a field of this weed by a most singular experiment. He dressed and manured it thoroughly, and sowed no crop, trusting to the oats. They grew up most abundantly. He cut them for hay, before the seed was ripe, and the field was never afterwards infested with that weed. Wild oats have likewise been extirpated by irrigation.

The common thistle (*cniscus lanceolatus*), and the field thistle (*cniscus arvensis*) are extremely injurious to all crops. They are for a time repressed, rather than destroyed, by a well-conducted summer fallow; but that is only a local remedy; for their numerous seeds, which are feathered, will often come from a considerable distance, and replenish the field that has been cleared. They are frequently cut close above the ground, by means of a very simple instrument, called a weed-hook; but it is done much more effectually, either by the hand, or by means of a pair of forceps or nippers with two long handles, by which the whole, or part of the roots are pulled up, and the plants either much weakened, or totally destroyed. In Derbyshire, they make use of a species of tongs, or pincers, with fluted jaws, which must be peculiarly effectual.

The dock, (*rumex crispus* and *obtusifolius*), is a hardy perennial, very tenacious of growth by its roots and producing a great increase of seeds. In arable land, the roots should be carefully picked off during the tillage season, otherwise they will produce vigorous luxuriant plants, drawing much moisture and nourishment from the soil, to the injury of the intended crop. Docks ought to be pulled up by the hand after heavy rains, when the soil is soft enough to allow their long tap-roots to be extracted without breaking, and long before the seed approaches to ripeness, or even before they blossom. If the season be too dry for that operation, they ought at any rate to be cut and carried off.

Coltsfoot, (*tussilago farfara*), was long accounted almost unconquerable, even by a fallow, the seeds ripening so early in the spring, that they were usually shaken before the ground had got the second furrow. It is now, however, ascertained, that there is little difficulty in subduing this noxious weed. For that purpose, the plant must be destroyed in August, September, or October, after the crops of corn are cut, at which time they are at their full growth, and easily discovered. They ought then to be pulled up, and every stock or root that can be laid hold of, carried off. This should be done most carefully, for about an inch below the surface, the roots have a number of buds about the size of a pea, which if allowed to remain till next spring, will flower, and

shed their seeds in spite of every precaution. This plan should be persevered in for a few years to give the experiment a fair trial.\*

By these means, more especially if accompanied by drilling, cultivated fields may be cleared from the dominion of weeds and though these several processes are troublesome and expensive, yet they cannot be dispensed with, as they are the only sure methods known of eradicating weeds, for the plan of ploughing them in, (which at any rate, can only answer in very deep soils), cannot be depended on.

It may not be improper here to notice, the great attention paid by the Flemish farmers to the weeding of their land; and as they know nothing of the drill husbandry in the culture of grain, the whole process is effected by manual labour. In the best cultivated districts, their exertions are incessant; and frequently from 20 to 30 women, may be seen employed in one field, kneeling for the purpose of greater facility in seeing and extracting the weeds. In the Pays de Waes, where the soil is light, the trident, or fourche a trois dents, is made use of, after the several crops are harvested, to tear up the root-weeds; and the same tool is successfully employed, in breaking the clods in strong land, when they become dry, for enabling the root weeds to be gathered, and facilitating the pulverization of the soil.

The clearing of arable lands, from weeds, may in general be accomplished by, 1. Complete and well managed fallows, whenever that operation is required; 2. By taking care that the manure used, is free from the seeds of weeds, or any roots that can vegetate; for which purpose, fermenting dunghills are advisable; 3. By a careful choice of clean seed corn; 4. By short tillage, or not taking too many crops in a rotation; 5. By drilling crops, in soils applicable to that culture; 6. By attentive hand weeding, and a spirited use of the hoe; 7. By the strictest attention to the choice of seeds, particularly those of grass, that no weeds are intermingled with them; 8. By weeding the land while in grass, so as not to suffer the seeds of any injurious plants to spread themselves; and 9. By breaking up the land, by pursuing such a system of cropping, as will not increase or encourage weeds, and in particular, by adopting rotations in which green crops shall predominate.

On the subject of weeds in arable land, it is highly material to observe, that their seeds are often mixed with the grain, and when ground with it, render the bread unpalatable, and unwholesome. Such weeds are universal enemies, from whose mischievous attacks no individual is exempted, and whose destruction, it is every one's interest, as well as duty to promote.†

\* The public owes these valuable hints to Mr. Rennie of Phantassie. The process is described at greater length in the General Report of Scotland, vol. ii. p. 554. It is much the custom with those who fallow land in Ireland to permit the weeds to shed their seeds, under the idea, that when the land is afterwards ploughed, they will be destroyed. This is one of the reasons, why the lands in that country, under this system, become progressively more foul and less fertile.—Remark by Edward Burrows, Esq.

† Communication from Edward Burroughs, Esq. Mr. Burroughs tethered seven sheep per acre in spring; and finding that there was better grass in the field in the middle of May, than when they were first turned on it, he was obliged to put two sheep more per acre to keep down the grass, in a state fit for that species of stock. In the Highlands of Scotland, they contend, that sheep when tethered, fatten more rapidly than in any other manner.

2. Grass Lands.—It is difficult, in some cases, to discriminate, in meadows and pastures, between the useful plants and those that are injurious; but amidst the great variety which nature produces in such lands, there are several, which are not calculated to feed domesticated animals, and ought therefore to be removed, for the introduction of others better adapted for that purpose. No person of common understanding, would ever think of allowing the live stock of his neighbours to feed upon his pastures, as the diminution of food to his own stock, by that circumstance, would be sufficiently obvious. A little consideration, however, may convince every individual, that a multitude of weeds, interspersed among his grasses, produce effects not less mischievous, than those that would ensue from such depredations of live stock. Yet from the Cheshire Report it appears that in some of the best conditioned pastures in that county, ragwort, docks, thistles, and knapweed, occupy at least half the land, to the exclusion of an equal number of useful plants.

Above twenty different kinds of weeds infest grass lands, besides about thirty more of less importance, whose characters are doubtful, or whose uses are not ascertained. Some of the most worthless, as the rush (*juncus*), and the sedge tribe (*carex*), may be got the better of by draining; others, like the mosses, (*musci*), either by cultivation or manure; but there are a few which require individual attention, before they can be eradicated, in particular the dock, the thistle, and the rag weed.

The dock has been already mentioned as a weed in arable lands. It is equally injurious to grass, both on account of its seeds and its roots. Its seeds are exceedingly numerous and heavy, but the stem is flexible, and the recoil from a blast, with a high wind, spreads them to some distance. Docks are found to vegetate equally on turf, and on naked mould. Every bit of root forms a new plant, even after the heart has been consumed by a species of caterpillar. To eradicate this plant in grass lands, the root must be completely taken out by the dock-iron, at or before the time of flowering, and thoroughly destroyed: this can generally be effected, after much rain. They are refused by cattle; but are eaten by fallow deer, which prevents their flourishing in parks.

## THE POOR LAW AMENDMENT ACT.

The following letter has been received on the subject of the refusal of a man at Basildon, to support his mother:—

“Poor-Law Commission Office, Somerset House,  
July 14.

“Sir,—The Poor Law Commissioners for England and Wales have to acknowledge the receipt of your communication, enclosing a statement in regard to a case which had occurred in the Bradfield Union, and upon which you desire the opinion of the Board. The Commissioners observe that a widow woman of the name of Lovegrove, living with her son, had been in the receipt of 1s 10d per week from the parish, and that the Guardians of the Bradfield Union considering that her son, who is a single man in constant employment, and earning 12s per week, was both liable and competent to support his mother, had reduced her allowance to one gallon of bread per week; that in consequence of this reduction, her son had turned her out of doors, and that she was therefore under the necessity of applying to the guardians for additional relief; that the guardians upon granting the required relief, had determined to apply for an order on her son for her maintenance, and that, upon their application, an order had actually been made by two Magistrates upon him

to pay is 9d per week towards the support of his mother. Upon the case as thus stated, the Commissioners have to express their satisfaction that the Board of Guardians have availed themselves of the enactments in the Statute of Elizabeth, which render natural relations liable to be compelled to maintain those who are reduced to a state of destitution. The Commissioners hope that those enactments, with the modification made by the 78th section of the Poor Law Amendment Act, will be found sufficient in the case in question. They consider it to be an instance of the effect of an abusive system of the administration of relief, which has led the labouring classes to believe that they were by law absolved from the performance of natural and filial duties, and which has thus led to the necessity of resorting to compulsory measures for enforcing the discharge of those duties; and this, too, as against an individual who appears to be of good general character and industrious habits. He admits, however, that he has the means of making a reservation from his wages, and the amount of those wages as compared with the wages on which other single men not only subsist, but make savings, renders such an admission unnecessary, and proves that he might provide for the support of his mother, without exposing himself to the evils of want. The Commissioners have further to observe, that the peremptory refusal of the son to obey the order of the Magistrates, his attempt to justify his proceedings by asking, “What is the parish for but to maintain old people?” and, above all, his inexcusable conduct in turning his mother out of doors, render the case in the opinion of the Commissioners one in which it is especially desirable that the law should be firmly enforced for the sake of example. Signed by order of the Board.

“E. CHADWICK, Secretary.

“To Edward Gulston, Esq., Assistant Poor Law Commissioner.”

The bakers in Paris have placed at the disposal of their society, for their protection and encouragement of the trade, 2,400 francs, or about 96*l*, as a premium to any individual who can discover a simple and ready method of ascertaining the adulteration of wheaten flour with the farina of potatoes, and at the same time determining the proportions of the admixture. One of the Parisian bakers, who has applied considerable attention to the subject, has forwarded statements to the society, in which he gives an account of a test, the result of which appears successful. At the same time a M. Boiteux has addressed the prefect of police, as the author of a process of ascertaining the presence of potatoe meal in flour; different samples have been forwarded him, and he has been successful in every instance in finding out the mixture or non mixture of potatoes with flour, or flour with potatoes, but has failed in every case in assigning with any degree of exactitude the different proportions. Though the public are indebted to M. Boiteux for the means of discovering the adulteration of the articles, yet the premium is still open to the application of the ingenious. We, however, believe, that there are not any ready and effectual means of determining the adulteration of wheaten flour with potatoe; the great difficulty arises from there not being any fixed *minimum* of the quantity of *gluten* in wheat, which is composed of starch and gluten; whereas, potatoe contains starch alone, and there is not therefore any chemical analysis to discover the admixture. By the assistance however of the *microscope*, this could be effected, as the particles of wheaten and potatoe farina differ in their construction; but in ascertaining the quantity of the component parts in the adulteration, we should think it impracticable, having no *minimum* of the gluten in wheat as before stated to regulate the process.

## AGRICULTURAL DISTRESS—SILVER STANDARD.

MR. CAYLEY'S SPEECH IN THE HOUSE OF COMMONS, ON MONDAY, JUNE 1, 1835.

(Concluded from Page 137.)

Now, Sir, what have been the disasters to which the landed interest has been exposed since that time? Have they not been such as to call for strong measures—such as to warrant inquiry? And yet the right honourable baronet has always refused it. The noble lord, the Secretary of State for the Home Department, said, the other night, that the committee of 1833 recommended the house not to interfere, quoting the words of Mr. Burke, that it was a “perilous thing to try experiments on the farmer;” but I say, Sir, that experiments have been made, and have been the source of mischief incalculable, and, I ask, are experiments only to be made one way—to produce ruin? Is Parliament to be omnipotent for evil, and impotent only for good? What were the opinions of Lord, then Mr., Brougham, at that time? What were his reasons for supporting the motion of Lord, then Mr. Western, for an inquiry into this subject of the currency? He spoke thus:—

“His reasons for supporting the proposition for inquiry were these,—Parliament had done that which gave the country a right to inquire: Parliament had been the great actor in that portentous plot, the unravelment of which formed the subject of the present discussion; in that plot, the full effects of which the country had not yet lived to see, but which was the cause of the evils, under which, at present, it was labouring.”

These were the opinions of Lord Brougham on the distress of the agriculturists, in 1822: he goes on to say, complimenting a speech which had been made by the hon. member for Whitehaven (Mr. M. Attwood), how absurd it was now talking of an immutable standard after the violation of it for twenty-five years; and after every one must have concluded that government never intended to return to cash payments; adding, that if inquiry was not granted then, it would be forced eventually. In the same debate, Mr. Ricardo stated, “that if in 1819, the currency had been depreciated to 14s from 20s, he would have coined 14s into a sovereign; but now, (after immediately before confessing that, the appreciation was owing to the operations of the Bank of England, which brought down the price of bullion) he would, as the depreciation was only 5 per cent in 1819, adhere to the present standard.” Now, Mr. Ricardo was the great oracle followed upon this occasion; and on very good authority he is reported to have been subsequently convinced that he had been mistaken in his opinion, that the depreciation had been only 5 per cent; on the contrary he was satisfied that the depreciation had been 25 per cent.; then 15s according to Mr. Ricardo’s own principles, ought to have been coined into a sovereign; in other words, all debts and engagements ought to have been paid with 15s instead of 20s. Debtors have thus been defrauded to this extent; but in fact, instead of 25 per cent., the depreciation had been 50 per cent. at least, measured in the prices of commodities, which were the true test; and all the misery consequent on the change of the currency, has been owing to the complete ignorance of the legislature on the subject; and we have been allowed to do nothing in any shape to rectify or modify the mistake, although the whole landed

interest was sinking under it. I ask any candid man, if parliament in 1819 did not legislate under error? I ask any of the right hon. gentlemen now before me, if that bill of 1819 had again to be brought before parliament, whether they would vote in the same way now as they did then? I am morally confident they would not. I ask whether they would return to cash payments, at the price of 3*l* 17*s* 10½*d*, for gold? thereby doubling all public and private debts; and lowering prices one half. I ask if they would not have coined the sovereign out of 14s, instead of 20s? I think I know one noble lord of great authority in this house, the last time the subject was discussed here, and who then occupied the office of Chancellor of the Exchequer (I mean Lord Althorp) who would have done so. I think I have heard that he has stated precisely what Mr. Ricardo stated, that if he had known in 1819, what he knew now, he would have coined the sovereign out of 14s. Now, Sir, I am no friend to an inconvertible paper, I merely want a palliative for the existing mischiefs—I want no more. When a mistake has been acknowledged by the perpetrators of that mistake, are they to go up blindly and cruelly acting upon that mistake, because they have fallen into it? or, because some are too proud to acknowledge their error, is the country to be exposed to ruthless misery in consequence? One of the witnesses before the agricultural committee of 1833, said, referring to the ruin of half the farmers, that “half the forest had been felled, and that we must patiently await the felling of the other half.” But are we to take this advice, and tamely submit to be filched of our properties? God grant that there be spirit enough left among a British public, to resist such an outrage on their rights, and their common sense. As Sir Francis Burdett said in the above debate in 1822, “It is not to be permitted that the people should die under it, because the King’s ministers did not choose to incur the responsibility of a remedy.” Another motion was brought forward in 1830, on the same subject, but without success. In the debate upon that occasion, Mr. Poulett Thomson is reported to have said, that he “greatly preferred a silver, to a gold standard (but not a double one); and he thought depriving us of a paper currency by the Act of 1826 (this was for extinguishing 1*l*. notes), was driving us back into a state of barbarism. But he thought we had paid the price of these changes, and so he should vote against reverting back.” Paid the price indeed! Had we paid the price in 1830, when no one denied the general distress? Had we paid it in 1833? Have we paid it now, with wheat fallen from 80s to 35s per quarter?

Sir, there are some who appear to think that because they are never tired of receiving this price, we are never to tire of paying it. If by the term “paying the price,” Mr. Poulett Thomson meant that the ruin consequent on the bill of 1819 was at an end, no mistake was ever more glaring and mischievous. There is still a last price to pay; half the farmers in the country, in spite of all who have been previously swept away, at this moment are living on their farms by sufferance—a modification of Mr. Peel’s bill would give them the means of going on: to refuse all alteration, is to drive them from their homesteads—to break up the kindly associations of generations—to bring them to the parish, or to expel them their country. Is this no additional price to pay—is not this a catastrophe worth the consideration of a beneficent government to avert? Lord Howick (and I mention the last two names, because they are members of

the present cabinet) said, on June 8th, 1830, I think on Mr. Attwood's motion for a silver standard and 1*l*. notes, that "he would have gone into an inquiry upon a silver standard and 1*l*. notes, but not vote for the specific measures." I ought to state that one cause assigned by Lord Londonderry, why he would not consent to Mr. Western's motion, in 1822, was that the change had so lately taken place,—so that it appears it was too soon in 1822, and it was too late in 1828, 1830, and 1833; and we shall hear the same doctrine repeated, I doubt not, to-night, in 1835.

If this were the only period in history when distress had followed upon raising the value of money, and increasing the pressure of fixed engagements, we might be the more doubtful of the cause of our present difficulties; but reference to our own history, even, will show this not to be an isolated case; and also that the country, ignorant of the cause of its distress, attributed it to a hundred delusive causes, rather than the right one.

In 1670 (says Mr. Taylor, in his history of the money-system of England) such continued to be the scarcity of money, that when the subsidy bill for granting one-twentieth part of all estates was read a second time in the House of Lords, his Majesty being present, Lord Lucas spoke to the following effect. He began by stating that all those hopes had been disappointed, under the impression of which his Majesty had been recalled to the exercise of the regal power: that the burdens of his subjects, instead of being lightened, had been increased, whilst their strength to support them had been diminished; that in the times of the late usurping powers, though the taxes were great, yet there was plenty of money throughout the nation to pay them with; but now (continued his lordship) there is nothing of this; brick is required of us, and no straw is allowed to make it with. For that our lands are thrown up, and corn and cattle are of little value, is notorious to all the world, and it is as evident that there is a scarcity of money.

Now, only let us change the words "since the restoration of Charles II." for "since the restoration of peace in 1814," and for the "late usurping powers," insert the words "the late war," and we shall have an accurate description of all that has been happening for the last twenty years. Sir William Petty, also, speaking of the extreme scarcity of money in Ireland, about this time, says—

"It would have been easier for the Irish labourer to have contributed forty-nine days' labour for the use of the state, if taken at seasonable times in the course of the year, than to raise 2*s* for his hearth-tax at one period, and just when the collector called for it. This extremity of hardship appears to have been produced by the narrow policy of the British government. The agricultural interest in England suffering greatly from the scarcity of money, was carried away with the impression that the introduction of Irish cattle into the English market was the cause of the farmer's distress; and parliament was accordingly induced to prohibit the importation of Irish cattle into England."

Here was the same story—a change in the value of money the cause of the fall in prices—the farmers not understanding that there could be any other cause of a fall in the price of their cattle, except more cattle coming into the market, very naturally attributed the fall to the importation of Irish cattle; they had to learn, as many of them have at this day, that prices depend quite as much on the quantity of money in the market, as on

the quantity of cattle or produce. The quantity of money and produce remaining the same, prices will remain the same. Increase the quantity of the produce, the money remaining the same, prices will fall; decrease the quantity of produce, the money remaining the same, prices will rise. Increase the quantity of money, the produce remaining the same, prices will rise; decrease the quantity of money, the produce remaining the same, prices will fall. If the farmers will keep this invariable rule in mind, they will never allow the sort of adversity to come which they have so long experienced; and if it should come, they will know the cause and the remedy. But it is not modern history alone to which we may refer for the mischiefs done to a country by a rise in the value of money, and fall in prices, that justly celebrated and profound German historian of Rome, Niebuhr, speaking of the calamities arising in Rome from an appreciation of its standard of value, goes on to say—

"There are but too many countries where a like state of things is to be found; where most of the landholders, though nominally they continue to be so, were they to discharge their debts, would have nothing over; and, till that time comes, are farming their estates for their creditors, as the Roman debtor farmed them for the usurer."

In speaking of the depreciation made in the Roman money, Niebuhr says:—

"The deterioration of the coinage, in the manner usual among barbarous nations, and in ages of ignorance, is mostly to serve very stupid, nay, profligate ends; nevertheless there may also be a state of things in which it is wise, and even necessary, to adopt a lower standard. Through a nation's own fault its own smaller currency, or through circumstances that could not be forestalled, lighter money from abroad may have become predominant, and have driven the heavier out of circulation; the wish to restore it were to swim against the stream, and can breed only mischief and disgrace. If a state have fallen into the unhappy system of paper money, if this sink in comparison with silver, then should a juncture of fortunate circumstances furnish the means of re-establishing a metallic currency, in a case of this kind it is altogether absurd, nay absolutely disastrous to do so, in such a manner, that the metal shall resume its place with the standard unchanged, and yet, that the sums in all contracts shall abide by their nominal amount; while it is impossible to keep up prices at the same height at which they stood in the time of the paper circulation. Nay, if even without paper money, all prices have been forced up for a course of years by extraordinary circumstances, far above the means of those which prevailed during the preceding generations, if the expenses and burdens of the country have increased at the same rate, and then the feverish condition should subside, and everything drop down for a continuance to the lowest average price; in such a case there is no hope of safety, except in a proportionate reduction of the standard, and to this result common sense has, in former times, led men; whereas theory and delusion now raise their voices against it.

At Rome the exigency was still more pressing. As in the middle ages, from the constant and unreplaced efflux of money towards the East, silver became scarcer and scarcer on this side of the Alps, and all prices kept progressively falling; so at Rome, as we have seen, copper gradually grew dearer in comparison with silver, and consequently with all other commodities; and this, although

Rome had no national debt, and her citizens no hereditary mortgages, must still have produced extreme hardship and distress in a number of instances. The pay to the horsemen and footmen stood fixed at a stated number of As's; though the countryman received a fewer number of As's for his crop, his tribute, notwithstanding, came to the same sum as if money were not worth more than formerly.

Can anything be more applicable to our own case than these observations of Niebuhr, a historian, than whom no one stands in higher repute at the present day?

Would to God we had followed the example of America; during her struggle for independence with this country she found it necessary to depreciate her money to carry on the war. Owing to some cause or other, England, during that struggle, depreciated her currency; and this was the main cause of our ill success in that contest. During the late war, however, we depreciated our money; which, and which alone, I believe enabled us to resist successfully the gigantic power of Napoleon. But what was the respective conduct of England and America under the circumstances of their depreciations? America paid off the debts she incurred in depreciated money,—in money of the same value,—that is, in depreciated money: in other words, she paid as much as she borrowed, and no more. England, on the contrary, acted on entirely opposite principles. Instead of paying her depreciated debts in depreciated money, she is paying them in appreciated money. In other words, she is paying two bushels of wheat where she borrowed one; 600,000,000*l* of public depreciated debt instead of 300,000,000*l*; and she is paying in the same ratio, and to a far greater extent I believe, her private debts. And what is the condition of England now, and what that of America! Is America accused of a breach of public faith because she paid only what she borrowed? In other days, Sir, England did not conduct herself so foolishly. In the reign of William III. the currency had become so depreciated that the sovereign went for 30*s*. They appreciated the currency, it is true; but the old debts and taxes they allowed to be paid in depreciated money. It was Mr. Pitt, Sir, who was the author of the restriction on cash payments in 1797; he was aware of its full effects: would that he had lived to the year 1819! for I have it from a member of this house, who heard it from a private and confidential friend of Mr. Pitt (I would repeat the name, but I do not feel justified in so doing), and in office with him, that Mr. Pitt had declared to him his intention of ascertaining the degree of depreciation on the return of peace, and adapting the standard of value to that state of depreciation. Had this been done 12*s* or 14*s* would have been coined into a sovereign; we should have had to pay very little more than we borrowed, but we should have paid as much; no creditor could have suffered; while all debtors and tax payers, which in fact are the millions, would have known the blessings of peace when peace came. Instead of which we have been bound, hand and foot, to the stern, implacable standard of 3*l* 17*s* 10½*d* per oz. for gold, which has pulled down prices, and brought on ruin. I seek, Sir, for a palliation of these tremendous evils. In my opinion we have seen enough of the effects of the gold standard. Surely, Prince Hal must have had it in his contemplation, in his speech to his dying father, when he said—

Therefore, thou best of gold art worst of gold;

Other, less fine in carat, is more precious;  
But thou, most pure, most honour'd, most re-  
nown'd!  
Hast eat thy bearer up.

I know I shall be told that it is too late to go back. Sir, I am not asking to go back; and they who accuse me of it, know it; but they know, also, that when they cannot answer a fair argument, they can injure a cause by throwing invidious aspersions upon it. What I am seeking for is, a palliation of the evils which took place in consequence of Mr. Peel's bill. I wish to go into a select committee to try if we cannot secure some substantial relief to the agriculturists of the United Kingdom. All the other plans have failed except such as have conducted to a larger circulation; and I wish a committee to decide the question whether parliament still has the power to afford relief. I contend that it has: it may say that it does not choose to adopt the remedy. But let the people know whether their representatives have the power to relieve them or not. If they cannot in any way relieve them, then they will cease to hope, and at least cease to be disappointed. If they can, yet hesitate to adopt the remedy, it is for the people, and the people alone, to decide whether the remedy shall be adopted. What some persons are afraid of is, that the people would get possessed of the knowledge that parliament has the power to relieve, because they are convinced that they will never rest satisfied until relief be granted. I ask, as an experiment, and by way of palliation, for a silver standard; because I know, and no one can deny, that more Bank of England notes would be issued, and much more safely issued, than at present: and prices would rise as a necessary consequence. I am only asking for the ancient standard of the country,—that which was in existence up to the year 1816, and which Lord Liverpool abolished; and for what? merely to satisfy an abstract theory, which he and his father held in common, that gold as the richer metal ought to be the standard of a rich country. The fallacy of this argument is obvious. Why is a country rich? Because of the number of its commercial transactions. Now, can any one imagine that a scarce metal can carry on a great number of transactions as well and as easily as a metal which is fifty times more plentiful? But Lord Liverpool took his ground very much on the fact of this country having, during the last century, voluntarily adopted gold as the medium of payment. The fact is true enough; but why did this country adopt that course? Only because, from accidental circumstances, silver was comparatively scarcer during the greater part of last century than gold; and having the option of paying in either metal, debtors, of course, paid in the cheaper metal—which was gold. But the same reason for adopting gold then, ought to lead us to adopt silver now, because silver is the cheaper metal; and the debtors of this country have been robbed (in addition to the confiscation arising out of the bill of 1819,) from 5 to 10 per cent., by the mere change in the standard from silver to gold.

Nothing will show more clearly the comparative value of silver, during the last century, than the following statement. At George III.'s succession to the throne, 1760, the coins, especially silver, were in a very imperfect state. The crowns and half-crowns had disappeared, although nearly 1,000,000*l* of them had been coined since the general recoinage of William III. Now, this fact of the crowns having been abstracted from the

circulation is an evidence of their value, for if there had not been an advantage in the withdrawing them, it would not have been done. The Mint sending silver out at a low price, when the market price is higher, will always make it a profitable concern for individuals to melt the coin, and sell it at the market price as bullion. At this time shillings and sixpences were principally current (in silver): 4,000,000*l.* of these, also, had been coined within the same period: every stamp and impression had worn away; there was probably one-sixth deficiency of weight in the shillings, and one-fourth in the sixpences. But what shows the preference of the people for gold during the last century is the fact, that from 1717, (when Sir Isaac Newton made his report on the relative value of gold and silver at the Mint, and in the market,) up to 1760, silver had been brought to the Mint to be coined, only to the amount of 584,575*l.* 14*s.* 11½*d.*—a period of forty-three years, which plainly shows the dearness (in comparison) of silver; for if the market-price had been beneath the Mint price there would have been a gain in taking silver to the Mint to have received back the higher price paid by the Mint. I have said that silver was the ancient standard of the country, the standard price being, from the time of Elizabeth, 5*s.* 2*d.* per ounce. I should, however, have qualified this statement, by saying, that in consequence of the wearing away and debasement of the coin in the last century, as a temporary measure passed from year to year, from 1774 silver was a legal tender in tale only to the amount of 2*s.* 1*d.*; but in weight at the rate of 5*s.* 2*d.* per ounce, to any extent whatever. The real standard practically, therefore, in the last century was, in consequence of the debasement of the silver coins, equivalent to about 5*s.* 6*d.* per ounce of our present money; that is to say, supposing the present market-price of silver to be 5*s.* per ounce, the standard of the last century was easier for the debtor by 10 per cent. than the existing standard; and supposing the price of silver in the market to be 4*s.* 9*d.*, which it has been within the last three or four years, the disadvantage to the debtor now compared with the time previous to the war is 15 per cent.—I mean in consequence of the change from silver to gold. But at 5*s.* 2*d.*—the old standard price—we should gain great advantage indirectly, as well as directly. We have the first authorities on our side in favour of silver as a standard. Mr. Locke stated that silver was the only fit commercial measure of value, and that gold ought to be allowed to find its own *agio*, or premium, in the market. He did admit, it is true, that gold might be suffered to be coined; but it was merely an admission, not an opinion, in its favour. Before the Bank Charter committee of 1832, many of the witnesses were favourable to a silver standard. Among these Mr. Horsley Palmer, then governor of the Bank, is asked,—

What is the par of Exchange between two countries, one of which has a gold, and the other a silver currency?—In this country it is the price of the gold currency in the foreign market at the moment.

Then anything like a permanent par of exchange between countries, one having gold and the other a silver currency, cannot be!—It cannot exist.

Now this is of great importance as bearing upon the exchanges, for I shall endeavour hereafter to show how seriously industry suffers in this country frequently through the operation of the exchanges. Again, Mr. Rothschild is asked,—

Would silver regulate the exchanges precisely

as gold?—Certainly; and in France and on the Continent, rather more.

You have said, that when any of the Continental powers wish to supply their military chests, they always made a demand for gold?—Certainly.

Does not that produce considerable fluctuation in the price of gold?—Not very much, because gold in general is not so much wanted on the Continent as silver: silver is the regular coinage of those countries.

Do you think that the value of silver is as little subject to variation as the value of gold?—Silver has no variation, because there is a coinage of silver; so that there can be no difference in silver, except at some times when it is wanted by any European government for particular purposes.

Has there been a great export of gold from France, at different times, for the purposes of foreign war?—Certainly: in general the gold is bought up in France before it goes from this country; and if there is a scarcity in France, then it is fetched from here.

Does the demand for gold from France produce a scarcity of money in France?—No.

Why is that?—Because the gold is in general in private hands; it is merchandise there.

If there was a demand for silver from France, would not that produce a scarcity of money in France?—Certainly, because it is the coinage of the country.

Then whenever there is a demand upon a country for a metal which is the standard of value, it will produce a scarcity of money?—Certainly.

This evidence is of great value at the present moment: gold is the standard and currency of this country, but of no other country under the sun, unless Portugal have lately adopted it. Now, gold is the most convenient for export, and therefore the metal most in demand for export, when any balance of trade has to be rectified, or when it is wanted for army chests in case of war, or other purposes. Silver not being required so much for these purposes, retains its place as currency in a country where silver is the standard; and this is of incalculable benefit to trade, as a means of sustaining an equilibrium of prices; because every time the standard money is withdrawn, the paper also is withdrawn which depends on the presence of that standard-money for its convertibility,—and then prices fall. But where gold is the standard, it is perpetually exposed to fluctuations. The Bank of England is bound by law to pay all its notes in gold. It is alarmed, therefore, whenever gold is leaving the country. This was the cause of the panic in 1825. That panic has been mischievously attributed to one-pound notes. It is true that one-pound notes had an influence on raising prices, and that had a tendency to drive gold abroad; but if silver had been the standard, at the old standard price, no panic would have ensued. It was the gold standard that caused the panic. The farmers want one-pound notes; but they ought first to have a silver standard, as a safe foundation for them.

There was a rule laid down by the Bank of England in 1832, that they should keep as much gold in their coffers as corresponded with one-third of their liabilities; that is, if their liabilities were 30,000,000*l.* they would have 10,000,000*l.* of gold in the Bank ready to answer their notes and other engagements; and they declared they should not be safe without this proportion. But what is the situation of the Bank at this moment? Their liabilities are near 30,000,000*l.*, while their bullion is only 6,000,000*l.* There has been a drain of gold

from this country in consequence of changes taking place in the currency of Portugal and the United States, for the last year; the Bank of England are drawing in their notes, and refusing accommodation,—all of which is most injurious to agriculture and trade,—because they are alarmed for their own safety. But ought this to be the footing on which our monetary system should be based? I ask for a change from a system so perilous and destructive as this, especially under the circumstances of the supply of the precious metals from the mines for the last twenty years, being only in the proportion of one-half of the supply of the twenty years preceding, which is of itself sufficient ground for requiring greater facilities in obtaining the measure of exchange. We have no means of knowing the actual price of gold, because we coin it here at an arbitrary fixed price of 3*l*. 17*s* 10½*d* per ounce: it is always to be had here at that price. When foreigners want it, therefore, they would be great fools to give more than 3*l*. 17*s* 10½*d* for it, when they can get it here for that sum. The market price of gold is therefore always kept below the English Mint price, except under circumstances the most extraordinary. We know not, therefore, whether, in consequence of the change, from silver and gold, to gold alone, we have not a standard at this moment 20 per cent. more appreciated than we had last century—in addition to all the far greater pressure occasioned by the change from paper to gold in 1819. In favour of silver as a standard, there is another authority I shall quote, whose opinion has always had great weight with the house on subjects of this nature—and deservedly so—because no one has been more extensively engaged in trade, or has prospered more in it, or studied its principles more deeply: I mean Mr. Alexander Baring, now Lord Ashburton. It may not be generally known to the house, that a committee on coins was appointed in 1797, which continued to sit at various times, and is supposed still to be in existence. They sat in 1797, and had various meetings, the minutes of which have been preserved, but not printed, except those of 1828, when they sat again. The right honourable member for Cambridge (Mr. Goulburn), was then Chancellor of the Exchequer, and at the suggestion of my honourable friend, the member for Norfolk (Mr. Wodehouse), these were allowed to be printed for the use of members. It appears from the minutes of the evidence, that the subject of silver as a standard was the main object of their sitting; and I will just mention the names of the committee in order to show that others, besides those who complain of Mr. Peel's Bill, can entertain the question of a silver standard without being taunted as friends of inconvertible paper. The committee which sat in 1828 was composed of the Duke of Wellington, the Earl of Dudley, Mr. Huskisson, Mr. Peel, Earl Bathurst, Lord Ellenborough, Mr. Arbuthnot, Mr. Herries, Lord Bexley, Lord Maryborough, Mr. Grant, Mr. Lewis, Mr. Goulburn, the Earl of Aberdeen, Viscount Goderich, Lord Farnborough, Mr. V. Fitzgerald, Mr. Wilmot Horton. Mr. Alexander Baring was summoned before this committee, and I will take the liberty of reading part of his evidence, and if I do it largely, it is because I attach, and I am sure the house will attach, so much importance to evidence from such a source on such a subject.

Is it your impression that it is possible and desirable to maintain in this country a silver currency as a legal tender, founded on the proportion

of silver to gold, established in the currency of France; or something very near it, at the same time that we maintain our present silver currency, which is obviously not in that proportion, and that there would be an advantage in that system? —I have always thought so, and certainly think so still. I have no doubt about it.

Mr. Baring goes on to say:—

A sudden change from peace to war, a bad harvest, or a panic year arising from overtrading and other causes, immediately impose upon the Bank of England, which is the heart of all our circulation, for the purpose of protecting itself, to stop the egress of specie, sometimes even to bring in large quantities into the country. These indispensable remedies are always applied with more or less restriction of the circulation, and consequent distress to those who have been for some time trading under expectations of the ordinary facilities of circulation and banking. No care or prudence can enable the great Bank, on which all smaller ones rest in the day of trial, to avoid occasional resort to those measures of self-defence; and that system of currency is the best, which admits of their being made the least frequently and with the least possible effort and derangement. Now it is evident that the Bank, wishing to reinforce its supply of specie, can do so with infinitely increased facility, with the power of either drawing in gold or silver, than if it were confined to only one of the metals. The choice is already much, but the circumstance that silver is the practical standard of Europe, more than doubles the certainty and facility of procuring a supply. Bills on Paris, Amsterdam, Hamburg, &c., once taken, secure silver, in which they must be paid; but if gold alone will answer the purpose of the Bank, gold is a merchandise which you must go into the market and buy. It may be forestalled by others speculating upon the Bank's known necessities, it will always be enhanced in price by them, and the real increased difficulty acting in an increased ratio upon the apprehensions of a body of directors, whose characters are at stake, will lead to extravagant precautions, the tendency of which will always necessarily be to cramp and reduce the circulation, and to increase the existing distress. \* \* \* \*

That the efforts of the Bank for self-preservation in 1825 made great havoc among its dependents through the country, is well known; and I believe it is equally so, that while it was rummaging every corner of Europe for gold, which could alone answer its purpose, it was sending large sums of silver from its coffers, which were perfectly useless. The wants of the Bank, when they occur, interest speculators and jobbers of every description, and, independently of operations to derive a profit from the price of the gold wanted, there will be persons interested in thwarting the Bank and preventing its supply. A large capitalist might do this with effect, a combination of three or four might do it almost with certainty; and it should be here stated that the banks of France and of Amsterdam both make advances at a very low rate of interest on the deposit of gold; I believe they advance the value less 10 per cent. By this means an advance of 100,000*l*. would lock up 1,000,000*l*., and 1,000,000*l*. would lock up 10,000,000*l*. It will easily be seen what advantage this circumstance affords for the combinations I have mentioned. All this is avoided by adopting the same medium of circulation with the rest of the world; by that alone you can go to the common stock for that occasional aid which

no precaution can prevent your sometimes wanting, for it would be uselessly extravagant for any country to hold permanently that supply of the metals which occasional accidents may render necessary. To be safe, you should make yourselves one of the general community of the world, for this purpose; any attempt at peculiarity deprives you of the benefit to be derived in the hour of need from the uniformity of the thing needed and the consequent facility with which it can be procured. The greatest facility would be attained by being able to use the two metals. That they can be so used, the example of France abundantly proves. But if it be desired that only one should be taken, I should certainly prefer silver for the purpose of conformity with other countries, and thereby opening to ourselves a more certain supply when needed. It has been somewhere said, that the more precious metals suited the richest countries. I cannot understand the meaning of this. If this country has a more than ordinary artificial existence, an enormous debt, an artificial price of food, a very extensive internal and external trade, while the precious metals, which are to be the basis which is to carry and secure the circulation necessary for such a bloated mass, are not materially increased; if, above all, a large portion of this circulation must of necessity be paper; we should surely be the last people to narrow the base of all this, by refining upon a question more suited to philosophers than practical men, as to the mathematical precision of a metallic standard, and content ourselves with that which satisfies and answers the purpose of the rest of the world. The difficulties we make about the possible variations between gold and silver, of an almost imperceptible fraction, leads us to overlook the really important variations which occur in the value of money as composed of its two elements, paper and metal, every time the fetters of these restrictions lead the Bank to the forced operations which I have described. These operations in 1825, made probably a real fluctuation in the value of the pound sterling of 15 or 20 per cent., in many cases perhaps much more, a large portion of which may be fairly ascribed to our pedantic attachment to the supposed perfection of the standard of a single metal.

It is further to be recollected, that the larger portion of the silver of the new world passes through our hands, which would give us a great facility for that constant supply which, under the system I recommend, would enable us to maintain most effectually an equable value of the pound sterling; for as I have already said, the value of this compound of paper and specie is more affected as compared with commodities, by the sudden changes in the amount of paper abroad, than by any other circumstance.

Justice between debtors and creditors throughout the country is best done by keeping the value of money, as compared not to one single article, but to all, as nearly equal as possible. Now it is well known that any extent of paper we can find the means of keeping in circulation, must be still inferior to what has existed before our return to cash payments; further, we have enhanced the value of money in Europe by our demand of gold for that purpose. Every consideration, therefore, of justice, of policy, and of economy, recommend the encouragement of as much paper as can be suffered with entire safety, and consistently with the avoiding those shocks and convulsions which are the inevitable consequences of any material excess. I believe this to be the best attained

by building upon the base of the double standard, or if not of the double, of the single silver. With this, I believe, the bank will work with more ease and confidence, as will consequently all those subordinate establishments which partake sympathetically, but infallibly, of its ease and quiet as of its ailings and apprehensions; and if this be true, it is equally so that the bank, having an easier recourse to the means of reinforcement, could safely afford to work with a smaller ordinary deposit of specie. The power of easily acquiring is equivalent to possession, and in this manner by removing impediments to the means of supply, you make a real increase of wealth.

These reasons have invariably induced me to think that we made a great mistake at the last settlement of our currency, in departing from our old system of the double legal tender. The events in 1825 strongly confirm that opinion, and I feel confident of the entire unsafety of our present system. We should acquire much present ease and facility by the change, and give to our paper circulation that power of contraction and expansion within reasonable limits, which is essential to its healthy action. Without it, I feel a strong conviction that we should not get through two years of any expensive war, without a renewal of the catastrophe of 1797, and a people so heavily laden as we are, would not easily recover a second time from such a misfortune. \* \* \* \*

Would not the weight and inconvenience of a silver coinage either give a great preference to gold, and occasion an *agio* upon it, or introduce a greater circulation of paper?—I think it would. In speaking of the facility that a system of this sort would give the bank (and when we talk of facility to the bank, it is facility to the country,) it would be well for your lordships to consider the increased facility which has arisen to the exportation of coin, from the two circumstances, of the perfection of the present coin, and the repeal of the law which formerly prohibited its exportation; because, although the change may be beneficial (and on the whole I think it is, though one is perhaps sometimes a little disposed to lose sight of the practical working of measures in favour of general principles), I think we cannot well object to the perfection of the coin, and the law which permits the free circulation of it; but there is no doubt that the machine moving with less friction, the coin goes out of the country much more rapidly than it used to do in old times; a person then collecting the gold, with all the imperfection of it in weight and risk of counterfeits, was materially clogged in his operations; and if you add to this, that the fact of its being illegal to export the coin, prevented all persons of character doing it, the exportation was reduced to persons who would violate the law: the difference of easy actual exportation under one law and the other must be very considerable. \* \* \* \*

I think also the bank would derive considerable advantage, from silver being less easily moved and used than gold; that the facility with which persons can carry off thousands of pounds in small bags in the case of gold, and the difficulty of doing the same thing in the shape of silver, creates mechanically a security to the bank, and gives to the institution more time for preparation. \* \* \*

The consideration of the greater extent of our transactions and engagements, as compared with France, and especially of our greater use of paper in them, lead me to the conviction that we require the larger base of the two medals. Undoubtedly, for practical use and comfort, our pre-

sent currency is convenient; but I cannot divest myself of the apprehension that our present is a fair-weather system, which the first clouds will endanger. This was proved in 1825; for although that crisis may in some degree have been brought about by mistakes, if we legislate on the presumption of absolute wisdom presiding over the bank and the government of the day, we shall be frequently disappointed. I am convinced that we shall not easily see two campaigns of any expensive war, without another suspension of cash at the bank; and I am willing to put up with some inconvenience and apparent imperfections in our current coin, for the more essential security to property, which I believe to be connected with the essential permanency of our standard.

I fear I have wearied the attention of the House by making these large selections from Mr. Baring's evidence; but it was of importance to my motion that this House should not be in ignorance of the opinion of so high a practical authority. There is more of the evidence which is well worth attention, but I will not detain the House by going further into it. To my mind, the great principle of our legislation on this subject should be—and this view is corroborated by the authority I have just quoted,—to secure the certainty of ultimate convertibility, but to place obstacles in the way of a conspiracy of individuals, arising either out of panic or design, coming suddenly on the Bank with demands too large for the Bank to pay at once in gold. The legal-tender clause in the late Bank Charter Act was intended to prevent any internal drain upon the Bank, that is, through the country banks. No one now has a right to demand gold at a country bank for any sum above five guineas, being obliged to receive Bank of England notes in its place. This very effectually protects the Bank of England, and yet is perfectly satisfactory to the public; for, as Mr. Baring said, facility to the Bank of England is facility to the public. The right honourable baronet, the member for Tamworth, was very determined in his opposition to this legal-tender clause, saying, that it struck at the root of convertibility. Who does not now see that this was an extravagant and theoretical alarm? He also said that it would be impossible for it to be carried into operation without the re-introduction of one-pound notes. There again he was mistaken. At the same time, I shall not be sorry if it in any way tend to bring back the one-pound notes; but I wish them to be on a sure footing. Greater facility to the Bank of England in conducting its operations—the great and constant plenty of silver on the Continent of Europe, where it is the general currency—the less liability to export, and so standing in the way of those fluctuations in the quantity of the circulating medium which have such an effect upon prices, and are so ruinous to trade, and which are the bane of the present system; these seem to be the chief advantages of a silver over a gold standard.

Sir, there is, however, another reason why some change is necessary in the present system, and in the present standard. I ask, what is the state of the Bank of England at the present moment? Last Friday, exchequer bills were at par, having been at a premium of 47s. two or three months before—an occurrence which has not been known since 1825.

The CHANCELLOR of the EXCHEQUER (across the table).—That was an accident.

Mr. CAYLEY.—The right honourable gentleman says it was a mere accident. It was no accident: it was the result of a vicious system. Whenever

the Bank, it is well known, wishes to enlarge its circulation, it buys up exchequer bills, sending out its notes in their place. On the other hand, when it wishes suddenly to diminish its circulation, it sells exchequer bills. It has lately been selling them, because its gold has, for the last twelve months, been gradually reduced from 10,000,000*l.* to 6,000,000*l.* To sell exchequer bills is the last resort of the Bank, under such circumstances. It has been unable to recover its gold. At last it resorted to the sale of exchequer bills, in such quantities as to lower their price, and to cause them to sink to par. But it did not get the gold for them after all. Such is the absence of profit in any productive investment, that there are about 12,000,000*l.* of deposits in the Bank of England, lying there without interest, watching every opportunity in the market to make some profit. These depositors, finding exchequer bills falling in value, and coming down nearly to par, buy them as the most profitable speculation; but they pay the Bank not in gold, but by a check on itself, in consideration of the whole or some part of their own deposits with the Bank. Thus the deposits have lately diminished, without increasing the Bank's hoard of gold. All these difficulties would be lessened by a silver standard.

It is no theory of mine, that the Bank is in an unsafe position. What is the language even of its own officers? At the meeting of the Bank proprietors, in March of the present year, the Governor said—

"There was no doubt that the efforts which the Bank of England had been making during the last twelve months to prevent the drain of gold, by contracting its circulation, had been counteracted by the course pursued by other banks of issue. During the period to which he had referred, the circulation of those banks had increased in the same proportion as that of the Bank of England had decreased. If this state of things should continue—if something should not be done to remedy the evil, it certainly would throw a heavy responsibility upon the Bank of England, and render it almost impossible for them to go on under the existing regulations."

No wonder that the Bank is in a state of alarm. What is the amount of bullion in its coffers at this moment? Their returns say 6,000,000*l.*; others, apparently on good grounds, assert that it is nearer 5,000,000*l.*; when, according to their own principles, it ought to be 10,000,000*l.*: and honourable gentlemen talk of the security of immediate convertibility under the present system! Why, the depositors at the Bank alone could cause it to stop payment in three days. Let us compare the present amount of its bullion with a period even when there was no practical necessity for its having a store of it at all. The amount, according to the statement rendered by the Directors to the Bank Charter Committee, stood in several of those years as follows:—

AVERAGE AMOUNT OF COIN AND BULLION HELD BY THE BANK OF ENGLAND IN THE YEARS

|            |            |
|------------|------------|
| 1798 ..... | £6,187,520 |
| 1799 ..... | 7,282,340  |
| 1800 ..... | 5,647,350  |
| 1801 ..... | 4,187,690  |
| 1802 ..... | 4,022,365  |
| 1803 ..... | 3,684,625  |
| 1804 ..... | 4,625,665  |
| 1805 ..... | 6,751,150  |

|            |           |
|------------|-----------|
| 1806 ..... | 6,101,105 |
| 1807 ..... | 6,313,595 |
| 1808 ..... | 6,935,705 |
| 1809 ..... | 4,070,590 |

What a dangerous state of things! not only for the Bank, but the country—a few days may produce all the evils of the panic of 1825. The mischief, I repeat, of the present system is, that it affords too great facilities for ill-disposed and mercenary individuals running to the Bank for gold; it does not in the least secure ultimate convertibility better than another system; it affords facility for the mischief, and no better security for the good. Now, silver, although equally as good a security for convertibility, would be an obstacle either to sudden or frequent runs upon the Bank, and thus prices and commerce would fluctuate less. I do not deny that part of my object is, that a larger Bank circulation could safely exist on a silver than on a gold standard; for higher as well as less fluctuating prices are my object. But one mode of inducing the Bank to issue more notes, would be a security against these runs upon them. It is related by the Chevalier de Johnstone in his History of the Rebellion of 1745, that in consequence of a rumour of the Pretender marching straight up to London, there was a run upon the Bank, which was staved off by their paying in sixpences. Before the sixpences were half gone, the Pretender was gone too; and nobody thought of coming upon the Bank any more for coin. If they had been compelled to pay rapidly in gold, instead of slowly in sixpences, there would have been a panic; and the danger to the country from the Rebellion would have been tenfold.

Again, during the three days of July—the Revolution of Paris in 1830—there was a great run on the Bank of France, it was staved off by paying in crown pieces; if payment could have been demanded in gold, the store would have been gone in one-fourth of the time. And all are agreed, that if the public are determined to press for payment in coin, and continue to press for it, no effort of any Bank or Government can resist it. Only conceive all the paper out circulating in this country—Bank of England notes, country bank notes, bills of exchange, checks, and all other species of paper, amounting at least to 200,000,000*l.* all demanding payment in gold; besides the national debt of 800,000,000*l.*, which is all by law convertible into gold;—only let us conceive even a hundredth part of this demanded in gold, on any sudden emergency! The Bank of England has 6,000,000*l.* of gold to answer this demand. The property of the parties issuing the paper might be all-sufficient if time were given, but in gold, each party, if all had an equal share, would get about three-pence in the pound of it. And yet, for a system like this, we sacrifice the best interests of the country. I remember the great objection of the right honourable baronet, the member for Tamworth, (Sir R. Peel,) to the legal tender clause in the last Bank Charter Act, was, that it stood in the way of immediate convertibility.

I have before shown how immediate convertibility of all the paper circulating, is by the confession of all parties possessing a knowledge on the subject, wholly impossible, if all are resolved on pressing for it. It is for this reason that I venture to differ in principle from the right honourable baronet. I maintain that having ultimate

convertibility always in view, that is the best medium of exchange, or standard, which throws obstacles in the way of any sudden caprice for a run upon the bank. Under these circumstances, I think it highly expedient that the public should be accustomed, in ordinary times, to deeming paper of a certain description secure of convertibility; because when an extreme crisis arrives, instead of looking for gold, which cannot be had, they will be satisfied with this paper, which is morally certain of convertibility, and so the panic will be staid in its progress. Silver would facilitate the operation of this principle—it would prevent many a crisis arriving, and would impede it in its progress when it did arrive. The United States have just fitted the price of their gold to that of their silver standard, at a sacrifice, I believe, of 6 or 7 per cent. without a murmur upon the subject. It is upon no abstract principle I ask, therefore, for this committee, as Lord Liverpool asked for and obtained the gold standard in 1816, without any one desiring it; but it is with a view to alleviate the misery which now exists, and has existed so long. My firm conviction is that we shall see no material rise at present in the price of agricultural produce, without some modification of the present standard of value, which alone has caused the great fall in all prices. We neither can, nor is it safe to go on as we are. It is our duty to tell the farmers whether we have the means of relieving them or not; and if after having exercised our best judgments upon the question, we find that there are no means whatever of producing effectual relief, then excited hopes would no longer be disappointed. But if on the contrary, we find that there is a mode of relieving the distress, it is not for us, but for the people themselves to judge whether they will have it adopted. The refusal of a committee will only look like a fear to have the subject investigated.

Sir, there is no safety in standing still; the whole of the home trade is affected by the ruined state of the agricultural interest, which is the foundation of the whole. My opinion is, that the numbers connected directly and indirectly with the agricultural interest is very much underrated, and purposely underrated, in order to give undue importance to the export trade. I contended last year that 20,000,000 out of 25,000,000 of the people of these islands are directly interested in the well-being of agriculture, and in its relief from its present depressed state, in consequence of the fall in prices. I did it on these grounds, taken from the population returns of England, Scotland, and Wales:—

|                                        |           |
|----------------------------------------|-----------|
| Agricultural occupiers .....           | 1,500,000 |
| Agricultural labourers .....           | 4,800,000 |
| Mining interest .....                  | 600,000   |
|                                        | <hr/>     |
|                                        | 6,900,000 |
| Manufacturers.....                     | 2,400,000 |
|                                        | <hr/>     |
| Millers, bakers, and butchers .....    | 900,000   |
| Artificers, builders, &c .....         | 650,000   |

| Shopkeepers.....                       | 2,100,000 |
| Clerical, legal, and medical.....      | 450,000   |
| Disabled paupers.....                  | 110,000   |
| Proprietors, annuitants * .....        | 1,116,398 |
|                                        | <hr/>     |
|                                        | 6,406,398 |

\* See Mirror of Parliament, ses. 1834, Vol. I. p. 848.

Now, taking the manufacturers at 2,400,000 in round numbers, as one-third of the 6,900,000 agriculturists and miners, I apportion the 6,406,398 individuals last mentioned as interested in, or employed, two-thirds by the agriculturists, and one-third by manufacturers. This will add 4,077,000 to the agriculturists, and 2,316,000 to the manufacturers; making 10,977,000 agriculturists, and 4,716,000 manufacturers. But of this number of manufacturers, half, at least, are employed (it is generally said four-fifths) by the agricultural body and its dependencies; this will deduct 2,358,000 from the aggregate manufacturing interest, and leave only 2,358,000 as the purely, or rather export manufacturing body, whilst it makes the agricultural body and its dependencies amount to 13,335,000. But, here, Ireland is left out of the question, which may be called a strictly agricultural country—Ireland, whose very existence almost depends on supplying us with corn. Add 8,000,000, the population of Ireland, to the above 13,335,000, you have a total of 21,335,000 as the real agricultural interest of Great Britain and Ireland, compared with not more than 3,000,000 at the outside, of the export trade. And the whole of this body of 21,000,000 is interested in a remunerating price for agricultural produce: and yet we hear nothing but “monopoly,” when anything is said of protection to agriculture. If it be a monopoly, the monopolists are 21,000,000 out of 24,000,000; and it will be difficult for the minority to persuade them out of the monopoly. The 3,000,000, whom I have stated to be the strictly export manufacturing body, have undoubtedly an interest in exchanging their produce for foreign corn, and they have an interest separate from the great body of the community, which consists of upwards of 20,000,000, and whose interests are strictly identified, as they supply each other with the necessities, comforts, and luxuries of life. Of this great body, British agriculture is the basis; and thus is the whole bound up with remunerating prices to our agricultural produce; and yet the honourable member for Middlesex asserts that this is essentially a manufacturing country,—by which he means that everything is to be conceded to the export trade. I, on the contrary, on grounds which I think indisputable, contend that its essential basis is agriculture, and that the encouragement of agriculture should be our first consideration, being the source of employment, as it is, to 20,000,000 of our population.

These are the numbers that are affected by our present ruinous policy; and can it be safe to stand thus doggedly out against them and their prosperity? In my heart, I believe that the present unsettled temper of the minds of the middle and working classes, springs from nothing so much as from their poverty and distress. To them, the institutions of their country are worth nothing, but as they produce comfort and competence; when they fail to obtain these, they become—and reasonably become—dissatisfied with their institutions,—first with those that really require reform, next with those that cannot be improved. But we have been governed by men who have only export theories, or who consult only those interested either in the export trade, or for increasing more and more, the value of money. I have before shewn, that the export trade is no test, and that it has been proved, on three separate occasions, to be no test of the prosperity of the home-trade, and especially of the agricultural interest. I implore the country gentlemen, in this house, to protest against the export trade being made the test

of their well-doing; at least, if they do not wish to see the transfer of their estates into the hands of the monied interest finally consummated.

Such, then, is the condition of the majority in this country. The farmer bankrupt; the landlords in the way to be expropriated; many of them gone; the labourer thrown out of employment; the shopkeepers without custom. These parties cry aloud for relief; but if they ask for it in the only mode in which it can come to them, they are taunted with a breach of public faith. Sir, they seek only public justice. They have been cruelly dealt with; publicly robbed; their estates and their labour confiscated. They appear at the bar of this house; at the bar of a reformed House of Commons, to have that justice conceded to them: they ask not for full redress, but for some palliation merely of their misery. And I trust they ask not in vain from a house affecting not merely to represent the opinions, but a house purporting to be resolute in its determination to remove the grievances of its constituents,—grievances now of twenty years' standing,—grievances which have no parallel to them in a free country, in the annals of history,—grievances which, in point of cruelty and oppression, throw those of Nero and Caligula altogether into the shade. These parties now demand redress at your hands: you may refuse it; but let us not delude ourselves with the idea that they will cease in their efforts to obtain it. Never till lately have they been aroused to the conviction of what the real cause of their misery was: the opinions which they held before of the cause were founded in error. As the errors were successively discovered, they ceased to press for relief in those ways. Already have the farmers of Cambridgeshire, Kent, Suffolk, Sussex, Warwickshire, Leicestershire, Yorkshire, and others, declared their conviction that the change in the currency is at the bottom of their distress; and, in proportion as they are right, will they gather strength to back their opinion, until he will be not merely a bold Minister, not merely a powerful one, but in the last degree short-sighted and insane who shall persist in saying nay to their just demands. You may tell me you cannot relieve the distress: I contend that you can; and I ask to have the truth of my assertion disproved before a select committee; if you can relieve, and won't, it is fit the country should know it; if you cannot relieve, as I said before, you will not only free the distressed from suspense, but prove that you have done your utmost for them. But it is in our power to relieve the distress. Mr. Pitt was anticipating some great reductions in the returns of industry, when he said—

At such a crisis, Parliament, if it be not then sitting, ought to be called together; and if it cannot relieve you, its powers are at an end. Tell me not (continued Mr. Pitt) that Parliament cannot protect—it is omnipotent to protect.

Sir, in seeking this mode of relief for the agricultural interest, I seek it at the expense of none of the other productive interests; on the contrary, they would all receive a stimulus and encouragement. If I look back to the years 1821-2, I find manufactures, and commerce, and labour generally languishing under the depression of agriculture. I find all of them springing up invigorated and refreshed by the increased currency of 1833-4-5. All was then prosperity; there was no dissentient voice. I propose to introduce the same results by different means,—means that shall secure us from the fatal effects of the panic of 1825. That panic was foreseen by all who understood

the subject of currency, and was the consequence only of ignorant legislation. I know I shall be taunted with the breach of "national faith." Sir, I seek no breach of national faith; faith has been broken with the public, and I seek to palliate the effects of that injustice. It will be said, the fixed annuitant will suffer from a rise of prices. From the rise of prices which I am aiming at, he will have no reason to complain. Wholesale prices have fallen one-half; it is those which I wish to raise, for these employ labour, and wages would rise in proportion to the fulness of employment; on the contrary, retail prices have only fallen one-fourth, so that the rise in articles of consumption would not be near in proportion to that in articles of production; and it is the good of producers generally which I am seeking. In this way the fixed annuitant will suffer far less than the producer will gain; for his income is spent on retail articles. Besides, whatever change takes place in prices, only affects the income of his fixed annuity.

Now, under any of the changes which I am about to state, the annuitant would have had no reasonable ground of complaint. Parliament passed a corn-law in 1815, making 80s the standard price for wheat: it is true it neglected to secure this price to the agriculturist, or rather took effectual means to prevent it, by the change in the currency; but if parliament had substantially secured 80s for the quarter of wheat, whether by a change of currency, or by any other means, the annuitant would have had no just cause for complaint; for the prices before 1819 were higher than 80s, so that he first received his annuity under the expectation of prices equivalent to at least 80s for wheat. Again, in 1822, the parliamentary basis of the wheat price was made 70s per quarter. Any act of parliament that had really and effectually secured that price to the farmer, would have committed no injury on the annuitant, because he had no reason to expect a less price. Then, in 1828, 64s was made the parliamentary basis of the wheat price: for three or four years subsequent to that period, deficient harvests created a price equal to 64s, and it is only the last two or three years that the annuitant has begun to expect a lower rate of price than 64s for wheat. Any change, therefore, now, which affected that price, would commit no real injury upon any party; while to the whole body of producers it would be an incalculable good, and would prevent the sweeping away from their homesteads full half the farmers of the country, who are now living on them merely by sufferance.

In conclusion, the mere monied interest, although so sanguine in its gain from the continuance of the present system, would not lose, because the rate of interest, driven down by the absence of profit in all productive investments, to 2½ and 3 per cent., would, by the change proposed, rise to 4½ and 5 per cent. the moment there was a prospect of profit in agriculture and the home trade. I have proposed the experiment of a silver standard in the hope of its producing these beneficial effects. Some change is absolutely necessary, for the country cannot go on as it is; nor ought we to allow it; for I contend with Mr. Burke, "that the foremost consideration of a government is the property of the citizen;—the first creditor of the State is the plough." Sir, I beg to thank the house for its kind and patient attention, and to move,—“That a select committee be appointed to inquire if there be not effectual means within the reach of parliament to afford

substantial relief to the agriculture of the united kingdom, and especially to recommend to its attention the subject of a silver, or a conjoined standard of silver and gold.”

(IN REPLY.)

Mr. CAYLEY.—Sir, I know that, according to the strict rules of the house, I have not—as my motion is, in fact, an amendment on going into a committee of supply—the right of reply; I trust, however, to the indulgence of the house, to allow me to say a few words in explanation. I have been taxed with a desire to injure the working-class by a rise of prices. Sir, I repel the charge with indignation. If there be a class in the community to whom I wish well—for whose benefit I would labour day and night—and whom I seek more than another to benefit by the measures I propose—it is the working-class. What is the value of low prices to that class, without employment, and without wages? I challenge inquiry into their condition now, and when prices were higher.

The SPEAKER.—I must remind the honourable member that he is exceeding the limits of an explanation.

Mr. CAYLEY.—Then, Sir, since I am not allowed to say more—although there are many points to which I should have wished to address myself—I will only add, in two words—the right honourable gentlemen who have spoken against the motion have entirely misapprehended or perverted its object. Whatever my opinion of the necessities of the case may be, my motion does not ask for the depreciation of the standard of value; and whatever their opinion may be of the results of the measure I mean to propose to the labouring classes, my firm conviction is—that that class, and their employers, would be equally benefited by it.

## THE CLEVER CLOWN.

BY JAMES BRUTON.

(From the New Monthly Belle Assemblée.)

Dang it! I be a clever lad,  
When I to talk begin;  
My seriousness makes neighbours grave,  
My joking makes 'em grin.

Both grave and gay I am by turns,  
Now dull, and now a jolly man;  
For fun a second Momus I,  
In grave discourse a Solemn 'un.

My hard words makes the yokels stare,  
For I be such a talker;  
They think I read the Diction'ry,  
But that to me is—Walker!

I spokifies on politics,  
And all the Tory gang,  
On Sunday morn, and Barber, says  
I makes a fine orang! (harangue.)

A heifer stuck fast in a gate,  
Once made the bumpkins stare;  
Says I from that a science learn,  
You see a cow sticks there!

If you could hear me talk, you'd say  
I was indeed a dab;  
I am a gifted creature, for  
I'm gifted with—the gab!

## THE AGRICULTURAL INTEREST.

I beg leave to submit to the Growers of British Corn the following as a copy of a Petition to Parliament, which may be curtailed, enlarged, or altered, as may be found best to answer the purpose.

The importance of such a Petition being prepared and signed by every grower of Corn in Great Britain, and that with as little delay as possible, needs no comment, nor any apology for the author's introduction of the same: and he begs it may have all publicity possible.

To the Honourable the Commons of Great Britain and Ireland, in Parliament assembled: the Humble Petition of—

Sheweth,

That your petitioners view, with considerable anxiety and alarm, the attempts that are making through the empire to depreciate the agricultural interests of the country, as well as the fallacious theories of political economists who would expose the home grower to the competition of the untaxed foreigner, and who are endeavouring to obtain a repeal of such protecting duties which may now secure the agriculturists against the importation of foreign corn. In advocating the utility, and even absolute necessity, of protecting duties, your petitioners need not point out to your honourable house the various trades which, as well as agriculturists, are upheld by such protection, and that even-handed justice demands, at least, as much protection for those who till the soil, as for those who are engaged in trades and manufactures.

Your Petitioners respectfully entreat your Honourable House to pause before you permit a fixed duty to be laid upon foreign corn, seriously expressing their belief that even a fixed duty of 20s per quarter would scarcely protect the British farmer: that the present graduated scale of duties was intended as a benefit to your petitioners, which they are firmly persuaded has been alone destroyed by the method of taking the averages,

Your petitioners therefore humbly pray your Honourable House that the present graduated scale of duties may continue, but that the averages be taken from the returns of the grower; and the merchant, corn-factor, miller, &c., should be obliged to make a return of such corn only as they purchase of the grower.

Your petitioners implore your honourable house to take these suggestions into your serious consideration, as the only means, they conceive, of preventing them from being removed from the station they are entitled to hold, and in which it once was the wise policy of the nation to endeavour to sustain them.

In addition to the above, we, the undersigned, beg to remark, that should the present favourable crops of wheat be secured in fine condition, that lower prices are certain, and if the same take place, they will unavoidably add total ruin to the present unprecedented low prices of wheat, which are far below a remunerating one to the British grower of corn.

We, therefore, take the liberty to recommend to your honourable house, that a loan of money be granted at 4 per cent, and proper persons appointed to lay out the same in wheat, the growth of the United Kingdom, and to be warehoused as a National Dépôt, under lock, in such towns as are best calculated to purchase and store the same, and whenever the average price of wheat of our growth shall be gazetted at 56s per qr., the wheat in dépôt allowed to come out of ware-

house to the consumers of wheat and flour only, at best price, adding to the same interest of money and expences in warehouse.

If the above scheme is adopted, it will not only secure to all mechanics and labouring classes good and cheap bread, but in case our future harvests are secured in bad condition, or the crops otherwise injured or deficient in quantity or quality, would enable us to be independent of a foreign supply of wheat.

It is also calculated, if the above or similar measures were adopted, they would prevent prices of wheat going lower, or in case of an advance beyond (what is only considered a remunerating price to the grower) 56s per qr; or admitting foreign wheat at a duty less than 30s 8d per qr; and what is not the least consideration, in case of such advance being realized to the cultivator, as above stated, it would be laid out by him in different articles of apparel, &c. produced by our own manufacturing districts, which would not only benefit the latter, but the traders in the same to a certain extent.

In conclusion, it is suggested that a printed petition should be prepared, and given to the leading agriculturists in every town, village, and hamlet throughout the United Kingdom, and by him presented to all growers of corn, labourers, and others connected with the cultivation of the British soil in his district, for their signatures, and when obtained to be forwarded to the members of parliament for the county, and by them laid before the House of Commons this session; lastly, we may venture to add, the strength of a country is its population, and it is numbers alone which have attention, and that in preference to the monied interest of the country.

And your petitioners will ever pray.

J. S.

Weaverthorp, Yorkshire Wolds, August 1, 1835.

## ON IRRIGATION.

(FROM SINCLAIR.)

OF THE SOIL AND SUBSOIL.—Irrigation is not restricted to any particular description of soil. Land naturally wet, may be greatly improved by it, when accompanied by drainage; and it is equally beneficial to that which is dry.

Rich looms produce the largest crops, even though the waters be not of the first quality. Peat-bogs, when properly drained, will likewise yield good crops.\* Irrigating adhesive clays is expensive, and the beneficial effects from it do not soon appear; but it is evident from a meadow near longleat, that even this sort of land may, by good management, be thus rendered more fertile: and it is well known, that some of the best meadows in Gloucestershire, and at Woburn, are upon a clayey substratum.

Barren slopes may be advantageously improved under the catch-work system; and in this way, much land, at present covered with heath, furze, or broom, may be rendered productive of hay, or valuable grasses. The most suitable soils however, are those of a sandy or gravelly nature; more especially when they can be irrigated by muddy streams, the sediment of which corrects their excessive openness.

\* Water is of great benefit to peat-bogs, or mossy grounds, by washing away improper ingredients, as the sulphate of alumina, by which that description of soil is rendered unfertile. In this way peat bogs may be enabled to produce succulent and nutritive grasses, and to rival the best natural meadows.

Indeed by means of the warm and rich waters, of a low, fertile, and populous district, impregnated with mud, and containing animal and vegetable manures, almost any soils may be converted into a rich meadow.

The bottom or subsoil of a water-meadow, is of more consequence than even the quality or depth of the soil. A loose gravel, or bed of broken flint, with little or no intermixture of earth, where that can be obtained, is the most desirable subsoil. With such a bottom, in seasons when water is abundant, a soil not six inches in depth, is quite sufficient to produce large crops.

**EFFECT OF CLIMATE.**—The process of irrigation, seems to be attended with much more beneficial effects, in warm than in cold climates. The difference of the seasons between Gloucestershire, in England, and Aberdeenshire, in Scotland, produces very important consequences. The latter is usually about five weeks more backward than the former: hence, it is hardly possible, to get such early crops of spring grass, in the districts of Scotland, as are easily to be obtained in England: and thus one of the principal objects of irrigation, (feeding ewes and lambs in spring), is thought to be unattainable. Nor will the application of water produce two, much less three crops of hay in Scotland, as it does in North America. The advantages of water meadows, however, are important, independent of spring feed; more especially when the catch work system can be adopted, as the expense of that process is inconsiderable.

**THE EXPENSE.**—This varies according to the nature of the work. Where the catch-work system is practicable, in favourable situations, the farming may be done as low as 10s per acre. This fact is, in many cases, decisively in favour of this natural and simple mode, which requires also much less water, and often answers fully as well as flat flooding.

The expense of *bed work*, as it is called, is however considerable. If the ground to be flooded, be smooth on its surface, or in regular ridges, and if the water can easily be brought to the meadow, with a temporary weir, supposing the extent to be almost 20 acres, it may be done at from 5*l* to 10*l* per acre; but if the land be of large extent, with an irregular surface if a large conductor, and a proper weir shall be required, with hatches both in it and also in the feeders, and if the aid of a professional person, to lay out and oversee the work, be necessary, (which is generally the case), the expense will vary from 10*l* to 20*l* per acre. Nay, in Wiltshire, where they are anxious to have their meadows formed in the most perfect manner, with that regularity which the nice adjustment of water demand, the expense per acre has amounted to forty pounds.\*

\* Smith's observations on Irrigation, p. 56.—Various accounts were transmitted to the board of Agriculture, of the expense of making water-meadows in different districts. The Rev. Mr. Clough, near Denbigh, in North Wales, expended 868*l* in forming about 50 acres into a water meadow; which is nearly at the rate of 30*l* per acre. Comm. vol. i. p. 263.—Mr. Eyres, of Longford Hall, in Norfolk, improved in the same manner 23 acres, at the expense of about sixteen guineas per acre, besides some extra charges. Ditto, vol. vi. p. 329.—Mr. Wilkinson, of Potterton Lodge, near Weatherby, in Yorkshire, converted 13 acres into water meadow for about 12*l* 12s per acre. Ditto vol. vi. p. 48.—And two spirited farmers of Norfolk (Mr. Beck of West Lexham, and Mr. Purdy of Castle Acre.) have tried irrigation with great success, at an expense of 30*l* per acre. Ditto vol. ii. p. 108, and 112.

**THE PROFIT.**—The profit resulting from this operation, when properly conducted, is always considerable. Mr. Wilkinson proves, by authentic documents, that all the out-goings, both capital and interest, were refunded within two years, besides a very considerable permanent increase in the value of the land. Mr. Eyres derived great advantage from his meadow, even the first season, by pasturing on it sheep, cattle, and even cart-horses. Mr. Clough found that land, which before irrigation was applied to it, was not worth more than six shillings per acre, was thereby increased in value to 2*l* 15s per acre, even to a farmer; and if let to the inhabitants of a market-town in the neighbourhood, would fetch 3*l* 10s if not more.

The following is the statement of profit from the formation of an irrigated meadow, on the estate of the late Mr. Ferguson of Pitfour, in Scotland, who carried on that species of improvement with much energy and success.

|                                                                                                                 |   |    |      |
|-----------------------------------------------------------------------------------------------------------------|---|----|------|
| 1. Interest, at 7½ per cent, on the original expense of making, 10 <i>l</i> on an average per Scotch acre ..... | £ | s. | d.   |
| 2. The old rent of the land .....                                                                               | 0 | 15 | 0    |
| 3. The annual expense .....                                                                                     | 0 | 10 | 0    |
|                                                                                                                 | £ | 1  | 13 0 |

The annual value being raised to 4*l* per acre, hence it is calculated, that there is a clear annual profit of 2*l* 7s per acre.

A very distinct account of the expense and profit of a water-meadow, is given in the Hampshire Report. The produce is stated at 9*l* 3s 4d per annum, without including the advantage of folding the sheep from the meadow, on tillage or other uplands, which is estimated to be worth 16s 8d more, or in all 10*l*.—The expenses, including the interest of the money expended in forming the meadow, amount, to 5*l* 18 6d, leaving a balance of 4*l* 1s 6d in favour of the meadow.

It is, however, contended, that neither the grass nor the hay, produced by irrigation, contains those feeding or fattening qualities which are found in upland herbage. The stock will "hold their own," or keep to the state in which they were, when put to such food; they will increase in size, but not in condition. Others will not admit to its full extent, the truth of the doctrine; and besides maintain, that the benefits resulting from irrigation, are sufficiently ample, to support the practice, even though its produce may not possess a feeding or grazing quality. Nor is the pecuniary profit arising from irrigation, so material, as those indirect or secondary advantages resulting from the system, which shall afterwards be detailed.

**THE GRASSES BEST ADAPTED FOR WATER-MEADOWS.**—Where the catch-work system is adopted, the surface of the meadow is rarely much broken; the natural grasses in the ground are trusted to, and it is seldom necessary to procure any seeds, except for bare or vacant spots. When ridges, however, are formed by the spade or the plough, they are generally destitute of grass when first laid down. It is necessary, therefore, to sow the seeds of such plants as are best calculated to produce valuable and abundant crops. The most useful are, 1. Perennial red clover, cow, or marl grass, (*trifolium medium*); 2. The rough-stalked meadow grass, (*poa trivialis*); and 3. The crested dog's tail, (*cynosurus cristatus*)—Timothy, (*phleum pratense*), is greatly preferred for water-meadows in America; and in boggy lands, fiorin, (*agrostis stolonifera*), is found peculiarly productive in that species of soil. Where the object is

pasture, rather than hay, white clover, rye grass, and the meadow, foxtail ought not to be omitted. The soil of itself, when watered, will produce grasses the most congenial to the state of the land, and the degree of moisture applied to it; but a little manure, at the commencement of irrigation, by beds, (unless the turf has been pared, and preserved to be put upon the surface), is thought by some advisable. In short the superior grasses in general will thrive under irrigation.

**THE STOCK TO BE FED ON WATER MEADOWS.**—The advantage which a sheep farmer derives, when the climate will admit of it, by feeding his ewes and lambs in spring,\* on a watered meadow, can hardly be sufficiently estimated.† At that pinching period of the year, food is always scarce; and lambs, once checked in their growth, cannot afterwards be fattened. There is an interregnum, (if the expression may be used), between the vegetation of one year, and that of another, which is best supplied by an early crop of grass. Where this expedient is not resorted to, or where Swedish turnips, cole, or savoys (kail), are not extensively cultivated, the farmer may have no succulent food to give his flocks, and will of course suffer severely. During spring Bakewell recommends, that no heavier stock than sheep or calves should be admitted on the meadow. Much, however, depends upon the quality of the soil and subsoil, for where either consists of gravel, a farmer can feed his milch-cows during the spring, and after making a considerable quantity of cheese, may obtain three tons of hay per acre. In Wiltshire, after a crop of hay is taken, it is not usual to attempt a second, unless hay is very scarce; for the grass being of a soft nature, it takes so much time to dry, that it can seldom be made into hay: and it is of much greater value when fed with dairy cows, which may remain on the meadows, till the floodier begins to prepare for the winter watering. In autumn, fattening beasts, and even cart-horses, have been put on a water meadow.

**ON WATER MEADOW HAY.**—As the grass of water meadows is frequently large and coarse in its nature, it is advisable to cut it young and then, if it be well made, the hay is of a nourishing and milky quality, either for ewes or dairy cows. It has likewise been given to horses, and when properly made they thrive upon it.

It is however, proper to observe, that from the great succulence of the herbage, the making of water-meadow hay, requires a very considerable degree of attention; and that when the grass from which it is made, has been over watered, or rendered impure by scum or mud; or when the hay has been ill made in the meadow, or injured in the stalks, it will be hurtful to any stock to which it is given: but that altogether originates from mismanagement, and it has been found by experience, that cows if they do not fatten so well, yet give much more milk from hay produced by irrigation, if cut early, and having much

more softness and succulency, than any hay produced from grass lands, that have not been irrigated.

**OBJECTIONS URGED AGAINST IRRIGATION.**—Some have asserted, that water-meadows render a country unhealthy, by making the water stagnant; but no opinion can be more erroneous. In fact where meadows are irrigated, the water must constantly be passing over the surface, with a brisk current, and always kept in motion, to be of any service. Many of the best meadows also, in their original state, were unwholesome morasses, the draining of which has essentially contributed to the salubrity of the air.

Others think, that though the produce may be increased, it becomes in a few years of so coarse a nature, being mixed with rushes and coarse plants, that cattle frequently refuse to eat it, and that the appearance of cattle so fed proclaims, that it is far from being of a nutritious quality, but this objection is never applicable to meadows skillfully made, and properly managed; and whenever the grasses are coarse they should be cut earlier, if intended for hay. The growth of rushes and water plants is a proof, that the meadow lies too flat, and is ill managed.

**ADVANTAGES OF IRRIGATION.**—Where the situation is favourable, the following benefits result from the practice of irrigation. 1. With the exception of warping, it is by far the easiest, cheapest, and most certain mode of improving poor land, especially if it be of a dry and gravelly nature. 2. Land, when once improved by irrigation, is put in a state of perpetual fertility, without any occasion for manure, or trouble of weeding,\* or any other material expense. 3. It becomes so productive, as to yield the largest bulk of hay, besides abundance of the very best support for ewes and lambs in the spring, and for cows and other cattle in the autumn of every year. 4. In favourable situations, it produces very early grass in the spring, which is doubly valuable; and 5. Not only is the land thus rendered fertile, without having any occasion for manure, but it produces food for animals, which is converted into manure to be used on other lands, thus arguing in a compound proportion, that great source of fertility.†

Were these advantages more generally known, or more fully appreciated, a large proportion of the kingdom might become like south Cerney, in Gloucestershire, where every spring, or rivulet, however insignificant, is made subservient to the purpose of irrigation, fertilizing, in proportion to its size, either a small quantity, or a large tract of land.‡

**INHABITANT TREE.**—Along the base of these mountains is a large tree containing seventeen conical huts. They are used as dormitories, being beyond the reach of the lions, which since the incursion of

\* The large water-dock is the weed that principally infests water-meadows. It ought to be carefully eradicated.—Smith's Observations, p. 40.

† In Davis's Wiltshire, it is calculated that 2000 acres of water-meadow, will on a moderate estimate produce in four or five years, 10,000 tons of manure, and will keep in permanent fertility 400 acres per annum of arable land.

‡ Gloucestershire Report, p. 280.—Watering of land, is also of use by destroying vermin in the soil. Bakewell practised this with success in lands under tillage. Red worms were thus destroyed as well as snails and grey-slugs, though they in general like moisture, and injure crops most in damp weather, yet do not agree with wetness.

\* It is generally supposed, that sheep would be rotted, by pasturing on watered meadows at any time, except in the spring; but in Derbyshire, there are several well-authenticated instances to the contrary.—Report vol. ii. p. 472 and 475. Much probably depends upon the slope, but more on the soil or water being calcareous. It is said that in Ireland, sheep and lambs are rotted on water-meadows even in spring, but that is not the case in England.

† Half an acre of water-meadow will support 1000 sheep per day in spring.—Smith's Observations, p. 111.—Wiltshire Report p. 127.

the Mantatees, when so many thousands of persons were massacred, have become very numerous in the neighbourhood and destructive to human life. The branches of these trees are supported by forked sticks or poles, and there are three tiers or platforms on which the huts are constructed. The lowest is nine feet from the ground, and holds ten huts; the second about eight feet high, and the upper story, if it may be so called, contains four. The ascent to these is made by notches cut in the supporting poles, and the huts are built with twigs, thatched with straw, and will contain two persons conveniently.—*Stedman's Wanderings in South Africa.*

## A CASE OF RABIES IN THE HORSE.

BY PROFESSOR DUPUY.

(From the Veterinarian.)

A horse, fourteen years old, that had been bitten by a dog supposed to be rabid, was observed not to feed so well as he was accustomed to do; and when, in the evening, he was placed in the stable, he attempted to bite the horses that were nearest to him.

In the morning he showed the same disposition—rolled himself on his litter, and uttered the most frightful moans. A veterinary surgeon was sent for, who gave him a drink composed of two ounces of aloes, and some mucilaginous injections, thinking that he laboured under stomach staggers.

On the following day all these symptoms were aggravated, and the veterinary attendant thought that he was affected with phrensy rather than indigestion; and, placing him in another stable, he practiced two copious bleedings during the day, and inserted two setons in the chest, and the same number in the thighs.

The violence of the symptoms rapidly increased—the animal bit himself every moment, tore the setons from his chest, and rolled about, and rushed at every one whom he saw. At length he broke his halter, and was loose in the stable, from which every one hastily escaped.

On the fourth day he continued to eat and drink, and even with avidity. His groom, entering the stable, offered him water; he drank nearly two pailsful, and made no attempt to bite him. It was not, however, thought prudent for any one to go near him afterwards, and his food was thrown to him through an opening over the door, and a bucket was likewise suspended from the door, and supplied with water by means of a copper tube. As soon as he heard the water falling into the pail, he fell into violent convulsions, seized the tube, and crushed it to pieces.

On the fifth day he was covered with sweat, his eyes glared, he continually shook his head, furiously bit the right side of his chest, plunged about, and sighed deeply every moment. He foamed a little at the mouth: when the water in his bucket was agitated, he was seized with violent convulsions. He would occasionally approach the bucket as if he wished to drink, and then, after agitating the water for some instants, he would fall on his litter, uttering a hoarse cry; but he would rise again almost immediately. These symptoms were dreadfully increased if water was thrown upon his head, and he would endeavour to seize it as it fell. This continued until the next day with little change, when he died in violent convulsions.

On examining him after death the muscles were found to be discoloured and softened; they were easily torn, and much black coagulated blood was

found in the intermuscular cellular texture. The subcutaneous cellular tissue was in many points infiltrated by a blood-coloured serosity resembling jelly, which was particularly evident about the larynx. This was also seen in the laminous tissue along the dorso-lumbar portion of the spine; and it seemed to unite together the granules of the parotid gland, which were gorged with black blood.

The muscular coat of the esophagus, of an orange-red colour, was easily torn; the substance of the heart was also discoloured and softened, and its exterior surface presented several large black ecchymoses.

The venæ cavæ, the right auricle and ventricle, and the pulmonary artery and its divisions, were also filled with black coagulated blood. The pulmonary veins, the left auricle and ventricle, and the large arterial vessels, contained blood of a much lighter colour than in its natural state; large ecchymoses were found on the lining membrane, and the pericardium contained three pounds of red serosity.

The tissue of the salivary and parotid glands was exceedingly red, as were also the surrounding parts. The liver was enlarged, gorged with black blood, and easily torn. The membrane lining the septum of the nose, the nasal cavities, the turbinated bones, and the guttural pouches, was thickened and infiltrated. That of the larynx, trachea, and bronchi, was of a violet hue, and all these passages were filled with mucus spume.

The cineritious portion of the brain and spinal marrow was redder than in its natural state, and the medullary substance presented numerous little red spots. The mesian and lateral sinuses of the dura mater were filled with black blood.

The membranes of the brain and the plexus choroides were very red, and the fringed or floating substance of the concretion was of a stony consistence.

The spinal marrow was softened at various parts, and particularly from the fifth cervical vertebra to the third dorsal. At the lumbar region it was fluid, or resembled a broken-down caseous matter. There was also a yellow infiltration about the roots of the nerves, and between the duplicature of the membranes which invested the spinal marrow.—*Journal Theor., Avril, 1835.*

**CAFFRE MODE OF KILLING CATTLE.**—The practice employed in killing their cattle is as barbarous as their method of cooking is revolting. The ox being thrown upon its back, and secured with thongs, an incision is made through the integument below the sternum; the hand is then introduced and the vital parts of the agonized beast are wrenched asunder with a brutal violence most distressing to witness. Such is often the multitude, both canine and human, assembled at these scenes of slaughter, that instead of any provision being laid by for future wants, every morsel disappears within a few hours after the animal expires, many a steak being cut from its flesh with the assagun before life has become extinct.—*Steedman's Wanderings in South Africa.*

An agriculturist in Picardy has invented a species of plough, with which he is enabled to grub up trees. This operation is a saving of more than 50 per cent, besides the rapidity with which the work is effected. The labourers who follow the plough, having only to attend to the cutting of the side roots which hold in the earth at the two extremities, and with this precaution, the plough is never broken.

## AN ACCOUNT OF THE VETERINARY COLLEGE, FROM ITS INSTITUTION IN 1751.

The following account of the foundation of this institution will be highly interesting, not only to those who have studied at the college, but also to every one who desires the promotion of the science.—

The ardour for improving arts and perfecting science in this country, has given rise to many excellent institutions, by means of which, the interests of mankind at large have been eminently served, and the sphere of human knowledge almost incredibly extended.

In adverting to these establishments, we may discern the efficacy of opulence and patriotism united for the public good; and we may, at the same time, form a very just ground of confidence, that the same faculties will still continue to be exerted for the support of other plans, tending to promote the same beneficial end.

Whatever may have been done to increase the public stock of knowledge in other departments, the veterinary science hath been hitherto little cultivated in this country; nevertheless if its claims to public favour were fully stated, there could be no doubt but that our national spirit and benevolence would patronise it equally with other branches of natural knowledge.

To define this science will be sufficient to recommend it in the most effectual manner.

The veterinary science, then, is the art of preserving the health of cattle, and particularly of horses, and of curing their diseases; and comprehends a full and just knowledge of those several animals; of their anatomy, physiology and pathology; a knowledge of the general laws of the animal economy, and of the particular ones of each distinct species; a knowledge of the animal structure and its relation to exterior matter, alimentary, medicinal, and noxious.

Many able and ingenious persons, within these kingdoms, have appeared to concur in the utility of this science, and wishes have been expressed that means were provided for the cultivation of veterinary knowledge; which, for want of such means, hath remained unimproved; but notwithstanding the frequent complaints, which are justified by the losses sustained, the treatment of our cattle, of so much importance to the prosperity of our country, hath been universally restricted to those who are most remarkably unqualified to undertake the charge. That the shoer of a horse should, by virtue of his trade, become equal to a task which, in order to its being perfectly performed, would require the skill of a Harvey and a Boerhaave, appears a paradox which could have gained credit only in an age of general ignorance and barbarism; when indeed medicine had to encounter enemies, not much less formidable than those which have obstructed the advancement of the veterinary art. It does however, nowhere appear, that absurdity ever rose to such a height as to consider the care of the human health, as the proper office of the shoemaker. There was a time, indeed, when much was confided to the barber; and at that period, medicine was nearly in the same state in which we see the veterinary art at this day.

The incompetency of the persons to whom it has been abandoned, has drawn contempt on the

art itself, and few have ventured to concern themselves with a profession that seemed incapable of conferring any honour upon those who exercised it. But the benefits of medicine to man, in the state in which it exists at this day, and in this country, are evident to every ingenuous mind.

To extend those benefits to those parts of the animal creation that are destined for the use of mankind is the object of veterinary medicine; and as the sphere of human medicine is of large extent, and embraces much more than the art of healing alone, so does that of veterinary medicine likewise comprise many important parts of natural history, and the fundamental principles of natural philosophy "*Sicut animalia post hominem, ita ars veterinaria post medicinam secunda est.*"

The laws of the animal economy of our cattle are as various and as intricate as those of our own; and if to preserve them alive, and in the most thriving state, be one of our first concerns, we ought in consistency to proceed towards that object, by a path capable of conducting us to it.

And here it may be observed, that the arts of surgery and of human medicine alone, can render very little service in cases of veterinary practice; while on the other hand, they may be, and frequently are, the sources of error.

The *Materia Medica*, as an instrument which the physician can use expertly in cases of human malady, is converted into weapons, to whose power he is almost a total stranger, when he would employ them against the diseases of brute animals. It is not sufficient to encrease the bulk of a dose, in proportion to the bulk of the patient; the operations of simples are different in systems that have different laws; and there are many things which the human frame may safely receive in large proportions, which must on no account be administered to the horse even in the minutest. It requires the sacrifice of as many years to become a skilful veterinarian as to become a skilful physician: the acquisition of the science and the practice of each is a task sufficient to engage one man's life; and the contrary opinion is a portion of that ancient error, which while medicine was regarded as the province of the learned and the few, supposed the veterinary art on the level with the most ordinary capacities. If the veterinary art is free from the embarrassment, which the varied and violent influence of the mind on the human structure causes to the physician, he finds an abundant source of trouble and perplexity in the muteness of his subjects, to which the physician is not subject; which renders it essential that the veterinarian should add to his professional knowledge an active and observing mind, and a cautious, accurate, and penetrating judgment.

The advantage of extending the influence of science to our farms, and of applying it to the preservation of our cattle, cannot be made to appear more sensibly than by considering the ravages sometimes made among them, by contagious and epizootic diseases; the virulence of which, might yield to a judicious and scientific treatment, when the only remaining alternative, ruinous in its consequences to the grazier and to the public, is in the slaughter of the cattle. All that the practice of our hospitals can teach, is unable to qualify for these emergencies, much less can adequate assistance be found, in the worker of a country forge. It is only in the direct experience of the case, and studies properly adapted to it, that relief may be obtained.

As the proper treatment of distempers in horses, and other cattle, is of the highest commercial as well as domestic importance, it is incumbent on this nation to institute and protect, a veterinary school; in which, their anatomical construction, the diseases to which they are subject, and the remedies proper to be applied, may be regularly taught. Such an institution cannot fail of becoming generally important to the nation, and every part of it will gradually enjoy the advantage of possessing enlightened practitioners, on whose care and skill they may securely rely.

The treatment of the diseases of animals being taught scientifically, men of liberal education will cease to look on veterinarian medicine, as a mean and degrading profession. They will be convinced that its inferiority to human medicine, consists not in the arts themselves, but in the relative importance of their respective subjects, and that it deserves to be considered a distinguished science, occupying an eminent station in the scale of natural knowledge.

If we observe the dangerous practice of farriers, in their surgical operations, we shall see them daily sacrificing horses by boldly mangling the organized parts of the body, without knowing anything of its structure. How many muscles, and tendons, divided crossways! veins opened! nerves destroyed! membranes torn! and essential organs more or less affected, by the ignorant boldness of these unskilful operators, whose reputation has been supported merely by public supineness and credulity.

It must be unnecessary to enlarge on this subject, in order to demonstrate the utility of a seminary for veterinary studies, in a country where horses are so universally used for the purposes of agriculture, manufactures, commerce, and pleasure, and where such immense property consists in cattle. Much however, as this science has been hitherto neglected, its importance begins to be generally admitted; and it must give pleasure to every considerate mind to learn, that a theoretical and practical school is established for the instructing of pupils; and it now remains only briefly to state the circumstances which have occurred in forming the institution.

In August 1785 the members of the Odiham Agricultural Society resolved, that it should be a consideration for their meeting in October, what were the most likely means to encourage the study of scientific farriery. Nothing however, appears to have been done by the society until May 1788, when they resolved to advertise their intention of educating two or more young men, in the school of farriery in the neighbourhood of Paris, and to solicit subscriptions for that purpose; which was not done till after a similar resolution in March or June 1789. In August 1789, they resolved that 500 copies of their resolution should be printed, with an address, in which they say, "It is to be lamented that there is not yet in England any establishment adequate to the desired improvement in farriery, by a regular education in that science, on medical and anatomical principles," and they again express their intention of sending two or more youths to France for instruction.

Early in the same year 1789, Mr. Sain Bel came to England and published proposals for reading lectures on the general knowledge of the horse; and in the following year, 1790, he presented to the public a plan, entitled "Plan for establishing an institution to cultivate and teach veterinary

medicine." At the end of May or beginning of June, in the same year, several of these plans were transmitted to the Odiham and other societies; and in August following the Odiham Society resolved that a committee should be appointed to meet in London for the purpose, among other business, of collecting whatever might appear to be conducive to the views of the society for promoting the improvement of farriery; and elected Mr. Sain Bel an honorary and corresponding member, and one of the committee in London. It does not appear that the committee made any progress in the business; but they continued to solicit assistance from the public, and resolved on the 12th January 1791 to meet once a fortnight, to communicate such information as might be received. At the meeting of the 11th of February 1791, several gentlemen, not of the Odiham Society, having been informed of the object of the meetings, attended the committee; and at this time the following resolutions were agreed to:—

The resolves of the Odiham Society of the 5th of August and of the 8th October, 1790, whereby is acknowledged the receipt of 10 copies of a plan for establishing an institution to cultivate and teach veterinary medicine by Mr. Sain Bel, being read.

"Resolved, That this meeting is seriously convinced of the benefits which must result from an institution to cultivate and teach veterinary medicine; that they have observed the effect produced upon the public by the proposed measure of the society for the improvement of farriery, as also by the plan offered by Mr. Sain Bel. That the ultimate view of the society tends to the same object as the plan proposed to be immediately carried into effect by Mr. Sain Bel; that it is the opinion of the meeting, that it is to be greatly desired the plan of the Odiham Society and that of Mr. Sain Bel, should be consolidated; that as several gentlemen had subscribed towards furthering Mr. Sain Bel's plan, four of the gentlemen present should be desired to consult with Mr. Sain Bel on the subject, and that they should also consider of the best mode of effecting the union; that as soon as this matter should be determined a meeting should be held for the purpose of forming a society for the improvement of farriery."

On the 18th of February, the gentlemen present were informed Mr. Sain Bel had acceded to the plan proposed, when they came to the following resolutions:—

"This meeting having taken into consideration the proceedings on former meetings, and being informed that many respectable persons delay giving in their names as subscribers, while the proceedings of the committee are subject to be reported to the Odiham Society, and are under the controul thereof, find it expedient to detach themselves from that Society. The work in which they are engaged being of considerable importance (the reformation and improvement of farriery and the treatment of cattle in general) requires that the attention of the meeting should be confined to that purpose alone, and be under the sole management and controul of its own members.

"That from that day the meeting should be called the Veterinary College, London; that the Secretary do write to the Secretary of the Odiham Society, to inform him of the above resolution, and that the members of the college conceive that by detaching themselves, they are more effectually forwarding the liberal and laudable intentions

thereof for the improvement of farriery, and that the members hope the society will join them in their plan for promoting the so much wished for object.

"That Mr. Sain Bel be appointed Professor to the college.

"That a general meeting of subscribers be held on the 8th of April.

"That the foregoing resolutions be inserted in the public papers.

"That copies be transmitted to the members of both Houses, and other noblemen and gentlemen; as also to the Sheriffs of the several counties to be laid before the grand juries at the ensuing assizes.

Feb. 23, Mr. Sain Bel attended and accepted the office of Professor.

April 1. The Duke of Northumberland having expressed his wishes for the success of the institution, the Secretary was directed to solicit him to become president of the college, to which he consented.

April 8. The college consisting of 64 members, proceeded to the choice of President, Vice-Presidents, Directors, Treasurer and Secretary for the ensuing year. They also elected as honorary and corresponding members fifteen gentlemen on the continent, eminent for their veterinary abilities. Regulations for the constitution and organization of the college were read and unanimously approved of, subject however to such alterations as might become expedient.

April 19. A circular letter was ordered to be sent to professional gentlemen in different parts of the kingdom, requesting the provincial names of diseases incident to horses, bullocks, sheep, &c., with their accompanying symptoms; a letter was also directed to be sent to the Odiham Society to inform them, that as the college had appointed a Professor of veterinary medicine they did not think it necessary to persist in sending young men out of the country for instruction.

May 3. An abstract of the constitution of the college was ordered to be printed and distributed. A letter was read from the Odiham Society, stating that they had peculiar satisfaction in the establishment of the Veterinary College, and that they had directed their secretary to transmit to the college what papers they possessed relating to the veterinary art; that they considered the college as enabled effectually to execute what they had wished, that they, therefore, relinquished their intentions, —and concludes with observing, that they had requested the subscribers to their fund to transfer their subscriptions to the college.

May 17. It was resolved to provide a proper place for the professor's dissections and lectures.

May 24. A general meeting was held, the college consisting of 86 members, when it was resolved to advertise for premises for the purposes of the college. The sum of £100 was fixed as the salary of the professor, and the same sum for the secretary.

July 19. A special general meeting was held, when it was resolved, that in order to procure the attendance of a sufficient number of members to transact business, the meetings should be open to the attendance of every member of the college, no business having been done since the former general meeting. The addition of members to the college was reported to be 32, making in the whole 118.

July 26. The secretary was directed to transmit the proposed regulations of the college to the army agents, and to request their forwarding them to the regiments.

August 9. The secretary was directed to transmit the proposed regulations to the physicians and eminent surgical practitioners in London.

September 6. A general meeting was held, when the number of members was reported to be 133. An offer was made by Messrs. Kirkman and Hendy of a parcel of land at Camden Town, the property of Lord Camden, for the purposes of the college, for a term of 99 years; when it was resolved, that the committee should meet on the 13th instant, to survey the ground offered. The secretary reported that 63 bankers and other gentlemen in different parts of the kingdom, had accepted the office of receivers for the college.

September 13. At the meeting of the committee at Pancras, for the purpose of viewing the ground offered by Messrs. Kirkman and Hendy, it was resolved to be eligible for the purposes of the college. And a house with convenient offices, adjoining the above-mentioned ground, was now engaged as a temporary residence for the professor.

September 20. A general meeting was held. The number of members was reported to be 138. It was resolved to agree with Messrs. Kirkman and Hendy for the ground proposed by them belonging to Lord Camden. The secretary was directed to apply to the president, vice-presidents, and directors, to request five or more of them to be trustees for accepting the lease of the ground from Lord Camden.

September 27. Letters were received from nine of the above gentlemen, approving of the situation for the college, and consenting to become trustees. Mr. Burton was requested, in conjunction with Mr. Sain Bel, to prepare and lay before a future meeting, a plan of a building for the college; and Mr. Burton was also requested to superintend any temporary erection or alteration in the premises engaged for the college.

October 4. An advertisement was ordered to be inserted in the papers, containing the terms on which the professor's lectures would be delivered at the college.

November 1. The secretary was directed to send abstracts of the proposed regulations of the college to the proprietors of the stage coaches. An advertisement was ordered to be inserted in the papers, directing persons desirous of becoming resident pupils to apply to the committee.

December 6. A general meeting was held. The number of members was reported to be 179. Mr. Burton produced a plan for the college. It was resolved that a collector for the college should be chosen. A letter from Dr. J. Corrie was read, offering his services to the college during his stay in the East Indies, in collecting information on the veterinary science; when, on the motion of Mr. Hunter, he was elected an honorary and corresponding member.

December 13. It was resolved that peers, members of parliament, and ladies, should be allowed to vote by proxy at all elections. The professor informed the committee he should commence his lectures on the 4th of January.

January 3, 1792. A general meeting was held. The number of members was reported to be 204. Mr. Reuben was chosen collector. At this time there were four pupils in the college.

January 10. Mr. Arthur Young and Mr. Marshall were elected honorary and corresponding members.

February 14. Mr. Baynes, Mr. Penn, and Mr. Stone, were appointed a committee to examine the accounts, and pay all demands, on the college.

On account of the great number of applications made to the professor to receive diseased horses, it was directed to be advertised that there were not conveniences for the purpose, but as soon as stables were erected proper notice would be given.

February 21. A general meeting was held. The number of members was reported to be 233. It was resolved, that the proposed regulations should be sent to every member, with a request that such alterations as might appear to be necessary should be sent to the secretary. Regulations for the interior discipline of the college were read and approved.

March 1. A letter from Sir William Fordyce was read, inclosing one from the Earl of Macclesfield, on the rot in sheep.

March 22. It was resolved that temporary stabling for the reception of fifty horses, and a forge house, should be forthwith erected; and that such horses only should be received whose disorders were not contagious. That two or more young men should be placed at the forge as working pupils. Mr. Burton was desired to prepare a plan and estimate for the building fifty stalls and a forge-house.

March 27. It was resolved to agree with Messrs. Kirkman and Hendy for an additional piece of ground adjoining to the former parcel engaged, and on the same terms making altogether about six acres.

April 5. Mr. Burton produced a plan and estimate for the building. A proposal was received from Mr. Barnard, proprietor of the premises now occupied by the college, for letting them on lease, when it was resolved to agree with him. A proposal was received from Mr. Warner, respecting making bricks, which was agreed to. It was resolved, that on any contract being made by the college, the contractors should give security for the performance of their agreements. It was resolved to advertise for proposals from builders for erecting stables, &c. to be received on Thursday, the 19th instant.

It appearing necessary from the numerous applications made to the professor for the admission of diseased horses, that stables should be immediately built, with other necessary conveniences; and as the present funds of the college would not enable the committee to proceed on so extensive a scale as the importance of the institution demanded, it was resolved, that the friends of the institution should be requested to advance money on interest at three per cent. per annum, the principal to be repaid as soon as the funds of the college were found sufficient for that purpose, and that nine subscribers should be trustees.

April 26. The committee having received proposals from six builders, they agreed with Messrs. Howell and Russell for the sum of 2850*l*. Mr. Burton was desired to order the necessary implements for the forge. A memorial was presented from the professor, stating that he had been calumniated both with respect to his private character and professional abilities, and requested committees might be immediately appointed to inquire and report on the business; when it was resolved, that Mr. John Hunter and seventeen other professional gentlemen should, in compliance with the memorial, be requested to examine the professor, as to his abilities for the office of veterinary professor, and report their opinion to a general meeting. It was resolved, that the Earl of Morton and twelve other gentlemen, be requested to inquire into the complaints stated, and

report their opinion to a general meeting; and the officers should furnish both committees with such papers as they should have in their possession, and which should be called for.

May 10. It was resolved, that a special general meeting should be held on the 17th instant, to receive the reports of the committees appointed on the 26th of April.

May 17. A special general meeting was held. The number of members was reported to be 425. The reports from the committees, appointed in consequence of the professor's memorial to inquire into his character and abilities, and the complaints made by him against the secretary were read, and the following resolutions unanimously agreed to:—

"That from the report of the medical committee, consisting of John Hunter, Esq. Chairman, Sir George Baker, Bart., Dr. Crawford, Dr. Packwood, Mr. Cline, Mr. Vaux, Mr. Peake, Mr. Home, and Mr. Sheldon, this meeting is satisfied that Mr. Sain Bel "is perfectly qualified" for the office of veterinary professor in the college.

"That this meeting concurs in opinion with the said committee, that it shall be necessary, in order to carry on the business of the institution as perfectly as possible, that there should be two professors appointed, and that as soon as the proposed plan for the college is executed, which, from the encouragement already given, it is hoped will speedily be accomplished, the members will avail themselves of the offer made by the committee, and refer the merit of candidates for the second professorship to their investigation.

"That from the report of the committee, consisting of the Earl of Morton, chairman, Lord Heathfield, Major General Murray, Mr. Angerstein, Mr. Baker, Mr. Baynes, Sir John Ingleby, Mr. Butt, Mr. W. Baker, and Mr. Walcot, this meeting is perfectly satisfied with the character and conduct of the professor."

It was resolved, that a special general meeting should be held on Friday the 1st of June, for the election of a new secretary, (the former one having been dismissed;) that at the election no person should be permitted to vote who was not then a subscriber.

May 24. The duty of the secretary was regulated by the committee, and his salary fixed at 150*l*. per annum.

A general meeting was held, when the Duke of Northumberland, Lord Rivers, Lord Morton, Sir T. C. Bunbury, Sir H. Mildmay, Mr. Baynes, Mr. Penn, and Mr. Stone, were appointed trustees for executing the deeds in the leases to be granted by Lord Camden to the college; and any three of them were empowered to act.

Also Lord Heathfield, Lord Kinnaird, General Murray, Mr. Angerstein, Mr. Butt, Mr. J. Baker, Mr. Crane, Mr. Topham, and Mr. Hendy, were appointed trustees for the subscribers to the loan; and any three of them were empowered to act.

The salary of the professor was fixed at 200*l*. per annum. The meeting then proceeded to the election of officers for the ensuing year; and afterwards dined together, the numbers were declared to be 478.

June 1. A special general meeting was held for the purpose of electing a secretary, when Mr. William Mounshee was unanimously chosen.

June 7. The committee formed regulations for the officers and for the infirmary.

July 5. The committee resolved to enclose the

whole of the premises by walls, Messrs. Kirkman and Hendy having proposed to join in the expense.

July 19. The surveyor was directed to give orders for building a porter's lodge, building a fence, and also to prepare a plan for the general building.

July 26. The committee resolved immediately to build lecture and dissection rooms, and to advertise for proposals from builders for that purpose.

August 2. The committee agreed with several artificers to erect the necessary buildings. Notice was ordered to be given that the forge was completed, and would be open for the reception of horses on the 10th and regulations were made for that purpose.

August 9. Regulations were made for the conduct of the porter &c.

August 16. Cards were ordered to be printed and sent with horses not admitted into the college.

August 30. The secretary was directed to advertise that the Professor's Lectures would commence on the first of October, and also the several arrangements in the college hitherto adapted.

September 6. A general meeting was held, when a state of the accounts were produced, and the medical experimental committee appointed, consisting of Sir George Baker, Sir William Fordyce, Dr. Crawford, Dr. Scott, Mr. J. Hunter, Mr. Clive, and Mr. Houlston.—It was resolved, that the anniversary meeting should be held on the 18th February next.

October 11. The committee resolved that one of the rooms in the centre of the building to be fitted up for the purpose of a temporary dispensary.

October 18. Mr. Kirkman was appointed to treat with the proprietors of the Hampstead water works for supplying the college with water.

October 25. A letter from President to Mr. R. Wilson was read, inclosing a draft for £500 as his subscription to the loan.

November 1. At a meeting of the council, Mr. R. Wilson was appointed solicitor to the college.

November 8. Mr. Burton reported, that the proprietors of the Hampstead water works had agreed to supply the college with water for one year, and then fix a price for a constant supply. Accommodations for the pupils being much wanted, and Mr. Kirkman having offered to accommodate the college with a house adjoining the college premises, for the secretary, it was resolved that his proposal be accepted, and that the Secretary do inhabit the same, as soon as it can be prepared and furnished for that purpose.

Nov. 15. At a meeting of the council, the price of the keep of horses were fixed, and regulations formed for the Infirmary.

Dec. 6. At a quarterly general meeting the college accounts were presented.

December 13. The committee gave orders generally for the providing all kinds of necessaries for the grooms, porters, smiths, &c., &c.

Jan. 1, 1793. The Infirmary was opened for the reception of diseased horses.

Feb. 14. A general meeting was held, and the regulations for the college were determined on.

Feb. 18. A general meeting was held, and the several officers of the college, as also the committees were elected for the ensuing year. At this time the number of the members of the college was 910; and the number of pupils in the college was 14. The establishment of the college, consisted of a Professor, a Secretary, a Collector, the Professor's Assistant, a Porter, 3 Smiths and

5 Grooms. The number of diseased horses in the infirmary were 50.

Such have been the origin and progress, and such is the present state of the institution, which, notwithstanding the prejudice of almost every class of men in the kingdom, may be said to have succeeded far beyond the highest expectations of its most earnest friends. From the foregoing statement every attentive mind must observe what obstacles may be overcome by industry and perseverance; and that in this country, the utility and benevolence of an institution need only to be perfectly ascertained, to meet with due attention and encouragement.

The institutors and friends of the Veterinary College presume, that to ensure the public patronage they have only to state the nature and tendency of the institution; being fully persuaded, that whether it be considered as an object of humanity to animals, or of general utility to the nation, it will excite and receive every degree of attention and support, which its intrinsic merit deserves.

*(To be continued.)*

## ON THE SPAYING OF MILCH COWS.

BY M. LEVRAT, LAUSANNE.

*(From the Veterinarian.)*

In May 1832, charged by the government of Vaud with the superintendence of the castration of the colts in that canton, the opportunity which this afforded me of repeating the experiments made in America on the spaying of the cow, was too favourable to be lost. I extracted the ovaries from a cow destined to be slaughtered. She was not then giving milk, and therefore my purpose could not be fully answered; nevertheless, it was something for me to have studied the method of performing the operation, and to have assured myself of its pathological connexion and effect. I should, on another occasion, be enabled to practice the operation with more adroitness, and I should probably inspire more confidence in those who might think proper to employ me. The cow seemed a little depressed during the first two days after the spaying, but on the third day she had regained all her ordinary habits and spirits.

I was then anxious to operate on a cow that was in the condition indicated by M. Winn, *i. e.* about a month after her second or third calving\*.

M. Francillon Michaud, to whom I imparted this wish, requested me to make the experiment on one of his cows. She was six years old, and had her third calf. In the preceding years she had given eight quarts of milk at each time immediately after her calving, and six quarts some months afterwards.

On the 28th of June, 1833, she was operated on. She appeared scarcely affected by it, except that she did not eat quite so much during the two next days, and her milk diminished to four quarts; but on the third day she recovered her spirits and appetite, and yielded her usual quantity of milk. During the summer she gave nine quarts at each milking, and after that, when the green food failed, she gave seven quarts, although, in the preceding years, she had not been accustomed to yield more than six quarts at this season.

Encouraged by the success of the first experi-

\* See an interesting paper on this subject in the *Veterinarian*, Vol. VII, p. 569.

ment, M. Francillon begged me to spay a second cow. He chose an old one that gave plenty of milk, in order that he might be able to judge of the effect of the operation on old cows. She was at least twelve years old, and had had two calves in the preceding October that had been got from her with considerable difficulty, and she was accustomed to yield, on the average, about eight quarts of milk. She was operated upon, on the 18th of November, thirty-three days after calving, and she was then yielding twelve quarts of milk. After the operation she yielded only nine quarts of milk; but it is right to say, that she had a purulent discharge from the vulva, and that she did not eat with the appetite she was accustomed to do.

Writers on the spaying of the cow have not described the manner of performing the operation; and it is well known that the ovaries do not retain the same situation in all animals. Daubenton was the first who described the spaying of the sheep; but the method which would be pursued with regard to the sheep would not be applicable to the cow. It is on this account that I feel disposed to relate the method which I pursued in spaying these animals.

The operation ought to be performed between thirty and thirty-eight days after calving, and on a cow that had just had her second or third calf, because that is the age and time when she yields the greatest quantity of milk, and retains it during the longest period. No preparation is necessary, except the refraining from feeding her so plentifully as usual on the night before the spaying, and to operate in the morning before she was fed. The necessary implements are ropes, a plank or bar of wood, two bistouries (one convex and very sharp, the other probe-pointed and straight), two curved needles, some strong thread well waxed, and a plank or bar of wood, about eight inches wide and three in thickness.

In order to operate safely and well the cow must be properly secured. To effect this, she must be placed against a wall with her left side towards the operator. Three strong rings should be fixed in the wall with straps and buckles attached to them; one for a cord to confine the head, the two others should be placed lower, the one on a level with the lower part of the right shoulder, the other at the point of the hock. A cord should be passed in front of the chest, brought along the left side of the body of the cow, passed behind the thighs, and fixed to the buckle which is on a level with the hock, or rather an assistant should hold the end of the rope passed once around the ring. The head is to be fixed by a turn of the cord, which is to be held by a strong man. Then the plank or bar of wood must be placed obliquely under the tests and in front of the hind limbs: an assistant holds this so that the operator may be safe from the kicking of the animal; finally some one holds the tail, or it is tied to the rope that goes round the patient, in order to escape the blows which the animal would give with it when the arm was passed into the abdomen.

In default of a wall provided with rings and buckles, a strong palisade will do, or any solid barrier, or trees growing at a convenient distance from each other, and to which a strong bar of wood may be fixed.

The animal being secured, the operator, armed with the convex bistoury, which he holds in his right hand, places himself at the left shoulder of the cow, with his left hand resting on her back. That hand serves as a point of support for him to

retire or rest upon, if it should be necessary, during her struggles, and also enabling him to use his right hand more effectually. He then places the edge of the bistoury on the middle and a little nearer the superior part of the left flank, and at one incision cuts through the skin and the muscles of that part vertically.

The flank having been opened, and the peritoneum with it, the operator enlarges the incision so as to be enabled to introduce his hand and arm. Taking the bistoury in his left hand, he now gently and cautiously introduces his right hand into the abdomen, directing it towards the pelvis, and behind the cul de sac of the paunch, where he will find the horns of the uterus. When he had recognized this viscus, he carries his hand a little above its bifurcation, where the ovaries are situated between the folds of the suspensor ligaments of the uterus; he seizes one of the ovaries, which he detaches at its posterior part, by means of the thumb and fore finger, and he passes his finger along the convexity of the ovary, in order to separate it completely from the peritoneal ligament which sustains it. Then he takes the ovary in his hand, he draws it gently towards him, and by means of the thumb nail, he saws the vessels and the horn of the fallopian tube on his fore finger, which offers him a point of support under these vessels: finally, he breaks the cord by successive gentle tugs at it, while he is sawing it with his nail; and he thus brings out the ovary.

He next introduces his hand a second time into the abdomen, and proceeds to extract the second ovary in the same manner, after which he closes the wound with two or three sutures, taking care to leave a little opening at the lower part of it, through which the matter of suppuration may escape, and which, without this precaution, would burrow between the skin and the muscles, or accumulate in the abdomen, and be a cause of irritation, and probably of danger.

The ovaries may, if the operator likes, be brought through the opening made in the flank, and detached by the points of the fingers; but this manipulation may sometimes be attended with inconvenience: besides, it is not more expeditious than that which I described, because it sometimes happens that the ovary escapes from the grasp, and the arm must be once more introduced into the belly in order to find it again.

Two or three days after the operation the wound may be dressed. The dressing consists in fomenting around the wound two or three times every day, and in hot weather injecting a little of l'eau de Labarraque (a solution of chloride of lime). A pledget of tow should be placed daily over the wound itself, and the stitches occasionally tightened. The wound will usually be quite healed in the space of fifteen days, or three weeks at most.

The cows on which I operated at the request of M. Francillon were all attended upon, and the wounds dressed and healed by himself: there is, in fact, very little skill requisite in this stage of the business.

From the observations which I have since been enabled to make, I should offer the following as the advantages to be expected from spaying milch cows.

1. An increase of at least one-third in the production of milch.
2. The certainty of having a nearly equal supply at all times.
3. Escape from all the chances and accidents that accompany utero-gestation and parturition.
4. Escape from the accidents which happen to

cows during the period of heat, arising from their riding and worrying one another, or their being injured by two large a bull.

5. The disposition to fatten more readily, and to greater extent, when their milk begins to fail.

6. The saving of an expense, often considerable, arising from barren cows, and which, in some districts, and on some farms, either from the influence of breed or bad management, occurs to almost every cow once in two or three years. As an illustration of this, I may mention, that, in the neighbourhood of Lausanne and Lavaux the farmers are often obliged to change their cows, an expense almost ruinous to them.—*Recueil, Feb. 1834.*

### THETFORD WOOL FAIR.

This Fair was held on Friday July 24, and was very numerously attended by the growers of Suffolk and Norfolk, and gentlemen connected with the wool trade from the North as well as the adjacent counties. Upwards of 200 persons dined in the Town Hall, and in other rooms from which they afterwards repaired to the galleries of the Hall. Mr. Coke was in the chair, as founder of the meeting.

Amongst the company were Sir C. M. Clarke, Bart. Capt. Fitz Roy, E. R. Pratt, Esq. A. Hamond, Esq. Wyrley Birch, Esq. B. Cladwell, Esq. W. Bagge, Esq. R. Buckworth, Esq. J. H. Powell, Esq. Rev. Mr. Broadhead, Rev. Jon. Townley, Rev. Jas. Bennet, Colonel Ray, Messrs. Amyss, Abbot, Adams, Alexander, Bryant, Beck, Blyth, Buck, Bidwell, Carse, Cooper, Cornell, Davy, Ellman (Sussex), Fullard, Frost, Fyson, Gayford, Garnham, Hudson, Kendle, Leeds, Milne, Mines, Muskett, Nunn, Negus, Overman, Payne, Reed, Rodwell, Read, Saul, Sexton, Shilito, Stedman, Stutter, Swan, Tubbs, Turner, Wigson, Wood, Wrightup, &c. and as dealers, Messrs. Baldry and Fuller (Halifax), Martin and Rouse, (Bradford), Evered, Evans, Fisons, Gardiner, Gill, Moyse, Mumford, Pymar, Revans, Sayer, Sheringham, Shepherd, Scott, Tetley, Waller, &c. The dinner was exceedingly well served by Mr. Edwards, of the Bell Inn.

After the cloth was removed, Mr. COKE gave "Constitution and King," "The Duke of Sussex," "The Bishop of Norwich," "the County Members." He had received a letter from Sir W. Folkes, who was prevented attending by a motion coming before the House. Mr. Pelham, the Member for Lincolnshire, had also informed him that his intention to be present, in the hope of establishing such a meeting in Lincolnshire, was frustrated by Parliamentary business; but that some respectable gentleman from that county would attend, and would gladly hear their opinion as to the practicability of establishing such a meeting. If any were present, he (Mr. Coke) hoped they would be able to make a favourable report, and he requested the favour of their company at Holkham.

Mr. G. WHITWORTH (of Acre House, near Caistor) said he had expected several gentlemen from Lincolnshire would be present, but he believed he was the only person from that county. He had some time since attended a meeting at Caistor at which Mr. Pelham (who, like Mr. Coke, had the interests of his county deeply at heart) expressed his wish to establish a Wool fair, and he was sure he would be sorry that he was unable to attend. He (Mr. W.) had seen a great deal of the wool trade, and was thought to have done some good in the county of Lincoln, where

he had no hesitation in saying the woolmen were playing a deep trick. (*Cheers.*)

Mr. COKE said he did not think such expressions were proper: every man had a right to make a fair profit by his trade, and his object in establishing this meeting was to promote fair dealing between buyer and seller. He always wished their meetings to pass off in good humour, which would not be the case if such remarks were indulged in. He hoped Mr. W. would excuse this observation: he believed he was indebted to him for some useful information at Holkham—particularly as to the grasses. (Mr. Whitworth is the inventor of the plan of inoculating pasture.)

Mr. WHITWORTH said he was the last person to say any thing which should interfere with the harmony of the meeting. His allusion was to the long wool of his county, which the dealers were employed in running down, though they were informed there was a very good trade in the articles made from it.

Mr. COKE said he certainly did expect more gentlemen from Lincolnshire. He had informed Mr. Pelham he should be happy to see the representative of the worst mutton in the kingdom. (A laugh.) In his younger days he had attended a meeting in Spilsby, when the long wools, with which the rents were chiefly paid, had fallen to 7s a tod, and great alarm was raised through the county. At that time Norfolk was parcelled out between three dealers, and the dealers never got more than 7s. a tod. With regard to the prices he was sure his friend Mr. Fison would tell them the manufacturers were never in a more wholesome state; and though they must not, perhaps, ask the same prices as last year, yet the establishment of a Yarn Company at Norwich must be something in their favour, as a saving in the expense of transport. Mr. Coke then told a humorous anecdote of Mr. Arkwright, originally a barber, inducing Sir Joseph Banks to take him to Court on condition that he should introduce the Lincolnshire wools into his manufactory. On the way Sir Joseph complimented Mr. Arkwright on the dressing of his wig, when Arkwright, told him he had sat up all night to do it. Sir Joseph found an opportunity to whisper this to the King, and when the cotton spinner was presented, his Majesty observed to him—"Well, well, of all the wigs I have seen at Court I have never seen a wig like your's Mr. Arkwright." Sir Joseph afterwards claimed the performance of his promise, but Mr. Arkwright answered, "I believe I did say something of the kind, but it would be so destructive to the spinning jenny that I cannot do it." Mr. Coke next gave the health of Sir Charles Clarke.

Sir C. Clarke returned thanks.

"Capt. FITZ ROY," who in returning thanks, begged to offer his *extensive* clip of ewe wool to Mr. Waller at the same terms as Mr. Coke might offer his, only stipulating that Mr. Waller should dine with him when he came to weigh it, though perhaps the price of their wine might outweigh the price of the wool. One reason for his coming here was to thank the inhabitants of Thetford for their kindness to his father and himself when canvassing the town. He was sure his father was a gainer in escaping the heated atmosphere of the House of Commons; and they were gainers also—for if they searched England through, they would not find a man more deserving of regard for all the amiable qualities of the heart than Lord Euston. (*Cheers.*)

Sir C. CLARKE proposed the health of the Chairman. In another county it might be necessary to explain how Mr. Coke was entitled to their respect,

love, and admiration, but it would be insulting the people of Norfolk to do so. (A gentleman said, "Or Suffolk either.") When he spoke of Norfolk he included Suffolk also—for he considered them as one in feeling towards their Chairman. Mr. Coke had encountered the foul air of the House of Commons—he said no more—for half a century—he had cultivated his lands in the best manner—he had furnished the table of his splendid mansion, not for himself but for the benefit of the agriculturists throughout the kingdom. (Great Cheering.)

Mr. COKE thanked the company from the bottom of his heart. He did not deserve the eulogy of Sir C. Clarke, but from an early period of life it had been his wish to mix with and to benefit the class of persons now present. He then adverted to the condition of his estate when he took possession of it, and to the progress of the Holkham meetings. When any improvement was suggested to him he never recommended it till after three years' trial, and he was eleven years before he obtained a single convert to the drill system. At that time Lynn imported 10,000 quarters of wheat; it had since exported 15,000. When Mr. Percival proposed to allow distillation from sugar, he (Mr. Coke) waited on him, and remonstrated against the injury which such a measure would inflict upon agriculture. Mr. Percival answered, "I know nothing about agriculture," to which he (Mr. Coke) retorted—"Then you are not fit to be the Minister of this country." (Cheers.) Mr. Percival, however, gave the West Indians this advantage (to the great injury of the farmer) solely for the purpose of securing their votes in the House of Commons. He hoped we had now arrived at a better state of things. (Cheers.) He begged to drink "prosperity to the Yeomanry of Suffolk and Norfolk." (Cheers.)

"Mr. Ellman and prosperity to the wool trade in the county of Sussex."

Mr. ELLMAN said that he had felt a great inclination to remain in the county for this fair, considering that it set the price for the whole kingdom. He understood there were to be sales of wool in London, this week and last to the amount of 400,000*l.* and should be glad if any one could state how they had gone off. He hoped to-morrow to have an interview with the Duke of Richmond, who had taken great pains to bring the French Government to a fair reciprocity in the wool trade. The French still laid a duty of 22 per cent. on our wool, whilst we received their's at a penny a pound. The Duke had put the matter on a plain footing. If we told them that unless they would come to our terms we would not deal with them, the business would soon be settled.

Mr. COKE then gave the health of Mr. Pratt, who in returning thanks, said he had received a letter from Sir Jacob Astley, whom he had expected till the last moment this morning to accompany him to the fair. He had attended this fair many years, and should do so as long as he was able. (Cheers.)

Capt. FITZ ROY gave "Lady Ann Coke and the House of Holkham." (Cheers.)

Mr. COKE returned thanks, and gave "Lady Clarke and the Ladies of Norfolk and Suffolk." He next gave "Mr. Fison, and prosperity to Thetford." No man could give them better information as to the state of the trade, and there was no one in whom he would sooner confide. He was sure he would admit the manufacturers were in a wholesome state. The way to make the fair prosper, was to act fairly between buyer and seller, and he must be excused for saying he thought the sellers last year exceeded in their demands any-

thing that could be rightly expected. He hoped he should never leave the room without disposing of his wool.

Mr. FISON, after returning thanks, said he did not regret that Mr. Coke had asked his opinion before he named a price for his wool, as it enabled him to give the meeting a piece of advice—not to ask too high prices. He did not wish to remind them of past errors, but they must all admit that the price of wool was much lower than last year. He certainly could congratulate them on the healthy state of our manufactures—the people were all employed, at good wages, and there was no superabundance either of the manufactured article or the raw material. But one complaint was general, and he believed well founded, throughout the manufacturing districts—the want of remuneration to the manufacturer. The fact that wool had been for some time gradually falling, in spite of the activity of trade, convinced him that the prices had been higher than the trade could afford. He would only add, supposing a revulsion in trade were to occur—which after so many months of prosperity was to be expected—what would then be the situation of the wool grower? With regard to the trade with France, the present state of the law was some disadvantage to us, but still more to France; for though British wool was not exported into France direct, at the duty of 22 per cent. he had been at a house in London in which wool to the amount of fifteen thousand pounds was prepared to be smuggled into France though Belgium, at a premium of 15 per cent. In reference to the high prices of last year, he might observe that whenever a great advance took place, a sort of safety valve appeared to be opened, and down went the price. He attributed this to the substitution of other materials for wool—such as hemp in carpets, and waste silk. This last article had advanced to a very great extent in consequence. He congratulated the company on the increasing attendance at this fair.

Mr. COKE thanked Mr. Fison for his information which he had no doubt was correct. The way to make the fair prosper was not to ask more than a fair price.—He had last year made 64*s.* of his Hogget wool, and 50*s.* of his ewe, he should offer this year's clip to Mr. Waller at what he admitted was a great reduction—namely at 54*s.* and 35*s.* Taking the experience of a long life, he believed he had made more money both of his corn and his wool, by taking the price of the first market.

Mr. WALLER began by saying he had never made a bargain in that room with Mr. Coke which he had not exactly fulfilled, though Mr. Coke had on one occasion very honourably and openly returned him 120*l.* at the ensuing fair, on account of his loss by the bargain. He last year gave him 4*s.* more than his wool was worth, as a proof of which nothing was afterwards sold above 60*s.* with one exception. He must say that Mr. Coke had now met the alteration in the market most honourably and liberally; one part of his wool was offered perhaps lower than he could have expected. He held at this moment 1300 tods of hoggett wool at 52*s.* to 56*s.* and ewe at 30*s.* to 35*s.* and he did not know where to find a market for it. He did not know where to make 56*s.* of Mr. Coke's hoggett, but taking the whole together he would accept his offer, and he flattered himself he should not keep it long, before he returned the small profit that would content him—a shilling a tod. He begged to give the health of the Hon G. J. Milles. (Cheers.)

Capt. FITZ ROY then offered his important clip to

Mr. Waller at the same terms as Mr. Coke's, and proposed his health.

Mr. COKE said perhaps Captain Fitz Roy's ewe wool, as Down, might be worth more money than his, but his object was to breed that sort of sheep which would bring the most money on the whole, by the carcase as well as the wool. He had found the advantage, from the Hampshire cross, of making a higher price than any one at this fair; he made a very high price of his mutton at Smithfield, and he obtained a return every year, instead of once in two years. He made as much of his lambs, as he used to make of his shearlings; he made 40s. of many lambs, out of the wool, last year, and the average was 32s. The last return from his salesman was rather lower.

Mr. WALLER accepted Captain Fitz Roy's wool, and returned thanks for the compliment paid to him. He was aware that Mr. Coke's hoggett wool was too high, and was not a purchaser of hoggett wool at anything like the price.

Mr. NEGUS offered his wool, (half Leicester and Down) to Mr. Moyse at 52s. Refused.

Mr. BECK (Congham) offered his to Mr. Fison at 56s. and 40s. Mr. Fison refused it as did Mr. Gardiner.

Mr. POWELL offered his to Mr. Head (who knew how clean it was) at 52s. and 32s.—Mr. Evered, for Mr. Head declined it, but offered 48s. and 35s. Not accepted. Mr. Fison declined it at Mr. Powell's price.

Mr. MUSKETT offered the Duke of Norfolk's wool to Mr. Sayer at 54s. for the hogget and 33s. for the fat sheep and flock wool. He had letters from Yorkshire which assured him the depression was only temporary, and agricultural labourers were so scarce that they were earning 15s. or 20s. a week. If so the manufacturers must have advanced their wages, and it was a fair presumption that they were making a good profit. His own wool, which had a little sand in it, he would offer at 52s. and 35s.

Mr. SAYER offered 50s. and 35s. for the Duke of Norfolk's wool. Refused.

Mr. Coke then gave "Prosperity to the Norwich Yarn Company."

Mr. D. BLAKE said this company had been established by 1001 shares, for the purpose of employing the surplus population, and restoring a manufacture which had long been lost to these counties. Norwich required a large supply of yarn, which they had been in the habit of bringing from Bradford, where it was spun from Norfolk wool. They had now 400 people, besides children, earning their livelihood in this manufactory, and the yarn was manufactured into fabrics used all over the kingdom and in many foreign countries. He hoped the undertaking would be encouraged in the county as well as in the city; but few county gentlemen had yet patronized it. They had now 2000 spindles at work, and though the Yorkshire gentlemen might smile, this was something for Norwich, and might be increased to 20,000. He should be glad to see substantial evidence that the Yarn manufactory was supported by the Norfolk wool-growers. Its business might be increased, for they were declining orders daily for want of more machinery and capital. If the manufactures of Norwich were considerably increased, the county would be relieved of its surplus labourers; so that it was the interest of the county in every way to support the undertaking. He hoped Mr. Coke, as the first wool-grower, would give it his patronage—if he would take a small share in the concern, he was sure it would thrive.

Mr. COKE said he was not aware of Mr. Blake's presence when he gave the toast. He thought the gentlemen of the county, should give the manufactory all the support in their power, and he himself should feel bound to countenance it as far as he was able.

Mr. D. BLAKE said he should be very glad if he and Mr. Waller could make any bargain so that Mr. Coke's wool might be spun at Norwich, and afterwards manufactured into an article that would reflect some credit on the city, and would be worthy to be worn by Lady Ann Coke and her family. He was sure there were manufacturers in Norwich who could produce a fabric equal to anything that could be made in England or on the continent, and he hoped Lady Ann would not decline to wear it.

Mr. COKE—"She shall go to court in it."—(*Cheers.*)

Mr. FULLARD said he had made up his mind to offer his wool (Lincoln, and not of the best description) so as to meet the low prices. He considered the depression was owing to the scarcity of sheep, occasioned by the rot for the last two years, being now filled up. Districts which, two years ago, produced only 3000 fleeces, now produced 4500. It would be some time before this would be worked off. He offered his ewe and hoggett wool together at 38s. Refused.

Mr. H. OVERMAN said he was one of those unfortunate persons who did not accept the prices offered at the last fair; and when they knew that wool inferior to their's by 6s. or 7s. had been previously sold at 63s. he thought they were justified. He did not feel justified in offering his wool at the prices asked to day, particularly as that Mr. Waller had given 57s. for hoggett and 43s. for ewe. That he did not continue those prices afforded too much reason to fear that the combination had this year fallen amongst the buyers instead of the sellers. As he did not feel justified in accepting the same prices for his fine wool as were offered for ordinary, he was not disposed to sell at present.

Mr. WALLER said Mr. Overman had not told them that the wool for which he last year asked 70s and 56s he afterwards sold at 52s and 33s. With respect to the wool which he had bought of Mr. Abbott, on the 30th of April, for 57s and 42s, he should be obliged to any gentleman who would take it off his hands at 54s and 35s.

Mr. Powell then offered his wool again to Mr. Head's agent at 50s and 35s, but Mr. Evered declined it.

Mr. GAYFORD offered his at 50s and 34s. If not taken he should be glad to have a bid.

Mr. COKE said if so fair an offer were not taken, it was little use remaining in the room, as it was evident no wool would be sold.

Mr. SHILLITO offered his wool (which he believed was very clean) at 50s and 35s. Not taken.

Mr. ELLMAN said he was afraid the buyers were taking an advantage of what had happened last year, hoping the growers would be frightened. But there was no reason to doubt of their obtaining a fair price for their wool. There was every disposition on the part of the growers to deal fairly, but the buyers seemed determined to hold off. When he saw wool refused at prices which he had been told by the buyers would be about the value, he owned he was surprised. It appeared to him there was—he would not say a combination, but an understanding amongst the buyers not to bid over one another.

Mr. Fison thought Mr. Ellman as a stranger, had dealt rather hard measure to the wool buyers. The word "understanding" was but a softer name for

combination, and that anything approaching to this had taken place, in the name of his brethren and himself, most solemnly denied. Mr. Ellman would allow him to say, that unless he were acquainted with the quality of the wool offered he was not competent to give an opinion. Even in the last week there had been a decline in the market. He left Bradford only last Saturday, and their agent had since sold wool at a halfpenny and a penny a pound less than he would have taken when he left.

Mr. ELLMAN confessed that he was not a competent judge of the Norfolk wool, but as the chairman had told them the Hampshire cross made such an improvement, he supposed that at least the Norfolk wool was worth as much as the Sussex. He knew something of Mr. Shillito's and the Duke of Norfolk's wool, and he was astonished that Mr. Shillito had not even a bid. Indeed the sellers had generally asked for a bid, but scarcely one had been made. In using the word understanding he did not mean to reflect on the buyers.

Mr. COKE said that having seen Mr. Shillito's flock last year, he must say he thought his ewe wool worth more than his (Mr. Coke's) and his hoggett little inferior. If, therefore, it was not worth the price asked, he had sold his for more than its value. From the information he had received he should advise the growers to take less than they had asked. If the prices of 35s and 50s were not given, he must be excused for saying he thought there was an understanding not to buy in the fair. That was the sort of opposition offered to him when he first established this meeting, and he hoped he should not see it renewed. If it were, he should say they were throwing every impediment in the way of the fair.

Mr. SHILLITO said he had offered his wool too low, being anxious to sell in the room, but he did not feel bound to take the same prices out of it.

Mr. BALDREY said he had come from a great distance, not to throw impediments in the way of the fair, but to promote it, and he solemnly denied that he had entered into an understanding or combination with any man. He did not know on what ground Mr. Ellman appeared here as the advocate of the Norfolk wool growers. If he saw him at Lewes he knew his object was to sell his wool at the best price he could get, but what business had he here, and why did he come here last year to state prices as having been given in Sussex which had never been realised! (*Hisses*.) As Mr. Ellman was surprised that there was no buyer of Mr. Shillito's wool, he called on him to describe it—whether the hoggets were sound, the ewes well washed, and how it was he was surprised.

Mr. ELLMAN said he had no desire to enter into a personal altercation. When he was asked what business he had in Norfolk, he begged to say that it was he who had introduced the Southdown sheep into Norfolk. (*Cheers*.) As to his having misstated the Sussex prices last year, he threw back the imputation with disdain, and he defied any man to prove that he had said what was untrue. So far from stating that prices were higher in Sussex, some one having said at Ipswich that 2s 6d a pound had been given in Sussex, he stated that it was untrue. He knew the character of Mr. Shillito's flock, and when he heard an honourable man say he had a good lot of wool, and that it was well washed, he was bound to believe it.

Mr. BALDREY said he believed that at the last fair Mr. Ellman said Sussex fleeces were selling at 2s a pound.

Mr. ELLMAN denied it. Their fair was not till after Thetford fair, so that he was not able to state the price.

Mr. BALDREY—You said something. (*Hisses and much confusion.*)

Mr. COKE said he thought it would have been better if Mr. Baldrey had made an apology to Mr. Ellman.

This unfortunate altercation broke up the meeting, the chairman retiring immediately after.

Mr. Powell and Sir C. Clarke sold their wool out of the room at 50s and 35s; we have heard of no other sales.

## LINCOLN SHEEP.

This county has always been remarkable for its breeds of cattle and sheep and for rearing them of an enormous size and weight. The cattle are now much crossed with the Durham breed, by which an animal is produced much handsomer in all its points than the original; the sheep are also crossed with the Leicestershire breed, and it is now difficult to meet with true bred Lincolnshire sheep.

The sheep are not only remarkable for their size and weight, but also for the surprising quantity and length of their wool; but whenever they are removed from their native soil into any other county they become much deteriorated, both in carcass and in the quality of their wool; this is doubtless occasioned by the difference of soil and climate. Amazing numbers of beasts and sheep are fed in the marshes during the summer, and the quantity of meat supplied from this county to the London markets is much greater than from any other.\*

\* Dimensions and weight of three sheep, belonging to Mr. Dawson of *Withcall*, as taken before the Rev. John Wray, Mr. Harland, Mr. Jones, and others, on the 21st of September, 1826:

## THE CULTIVATION OF THE POTATOE IN LANCASHIRE, WITH PHYSIOLOGICAL AND ELUCIDATORY OBSERVATIONS.

TO THE EDITOR OF "THE FARMER'S MAGAZINE."

Sir,—I believe it is generally admitted, that if the cultivation of the potatoe be not better understood in the county of Lancaster, it is more extensively grown in this palatinate, than in any other part of the kingdom; and in quality decidedly superior. But, at the same time, it must be acknowledged, that, notwithstanding the great length of time which this useful vegetable has been successfully cultivated in Lancashire, the merit of producing the best potatoes in the world arises rather from the nature of the soil than pre-eminence of ability or superior genius; since, it must be acknowledged, its rural population can lay claim to no very high degree of intellectual attainment, or scientific research.

Having attributed the incontestable superiority of the Lancashire potatoe to the quality of the soil, I beg leave to offer a few observations upon what may be called the philosophical part of the inquiry, as notwithstanding what has been written on the subject, I have never yet seen anything in the form of scientific illustration. It is very well known, that the land, in the greater part of the county of Lancaster, is light and sandy; and it is upon these light and sandy parts of Lancashire that the *pink eye* (far superior to all other kinds of potatoe) is grown. In order to give the reader a clear idea of my notions on the subject under consideration, as well as to enable him to form a satisfactory opinion for himself, it will be necessary to state, that the light sandy soils in the county of Lancaster differ very much in quality from the Woburn sands, for instance, from the sandy parts of Cheshire, or from the sandy soils of any other part of the kingdom which have fallen under my observation. The light sandy soils of Lancashire are softer than those found in other parts of the kingdom, and more adhesive also.

From attentive observation, I have not the least doubt that much of the land upon which the best potatoes are grown in Lancashire has experienced very considerable alteration from the influx of the sea. In all the lower parts of this county, there are very extensive marshes or morasses, or what the inhabitants emphatically distinguish by the word *mosses*; thus we have Halsall moss, Skelmersdale moss, &c., &c. At some period (no doubt very remote) these mosses were covered with trees and underwood, as the incontestable evidence of facts sufficiently demonstrate: they formed woods, which must have existed at least a century, as the large oaks, which frequently make their appearance at the present day on the surface of the earth, may be regarded as incontrovertible proofs. These oaks have become black from lying in the earth for many centuries, but are perfectly sound, more solid, and much harder, than the same timber which has not undergone a similar interment. It seems strange how these ponderous logs, so much heavier than the earth in which they have been so long imbedded, should make their way to the surface! But such is the fact. A gradual rising or elevation of the earth will be perceived immediately above the tree, which is progressing towards the surface, and as it makes its way upwards, the elevation continues to increase; and so well acquainted are the occupiers of these mosses with the nature of this extraordinary pro-

cess, that they are able to form an opinion of the depth at which the tree lies buried from the moment they perceive the undulation; they watch its progress; and, when it has reached within a few inches of the surface, they assist the exhumation, completely uncover it, and take it away.

Now, although the solid part of the tree evidently hardens from the exclusion of the atmospheric air, and the mysterious operation of the bog upon it, yet the leaves, twigs, and smaller branches experience a very different result: they undergo a sort of decomposition, by which they are converted into that light black soil which appears essential in the production of the best potatoe in the world.

A great part of these mosses have been drained, and are in the highest state of cultivation of which it is susceptible; it is called *Car Land*, and excellent crops of grass, as well as of potatoes and wheat, may be obtained from it. This Car Land forms some of the best pasture ground in Lancashire; a proof of which may be seen on the estate of that indefatigable cultivator, Mr. Shaw, at Hoscarr Moss; and a similar remark will apply to many other places well known to the writer, but not necessary here to enumerate. The next quality of reclaimable Moss Land is that which has not been so well drained, nor so long under cultivation; but upon which the very best potatoes (and good oats) are produced. Some parts of these mosses have not experienced that superior degree of cultivation which would certainly have taken place, had the prices of agricultural produce continued at the war scale; and some little is not, perhaps, susceptible of cultivation from the difficulty, or perhaps impossibility, of effectual drainage—such, for instance, is the case with Martin Mere, the property of Charles Scarisbrick, Esq., Sir T. Hesketh, and the Earl of Derby; where, during a part of the year, about ten thousand acres are covered with water, where, on the approach of spring, the deep booming of the bittern is heard, and which is animated by the fluttering, floating, and discordant notes of myriads of web-footed and aquatic tribes, and where that splendid bird, the wild swan, is an annual visitor.

However, upon these cultivated mosses, and their immediate vicinity (where the soil is similar) the best potatoes are grown. The soil, as may be easily imagined, is of a very dark colour, frequently intermixed with sand of a lighter complexion; and either with this admixture, or without it, it still retains that degree of lightness or porosity that, whatever rain may fall, the superabundance will run through it, though sufficient moisture is retained, or absorbed for the support of the growing potatoe:—hence the superiority of the Lancashire potatoe. The principle will be more clearly seen when exhibited in the way of contrast.

Potatoes grown on the stiff soils of Cheshire, Staffordshire, Leicestershire, &c., are distinguished from those of Lancashire by their waxy and watery quality: the reason seems obvious: the clay upon which they have been propagated, by retaining more water after rain than is necessary for the production of superior potatoes, is thus enabled to impart something of its own quality to the thriving vegetable, since the analogy between clay and a waxy potatoe cannot be called in question. The Lancashire potatoe (the *pink eye*) is as remarkable for its mealy farinaceousness, as the potatoe grown on a clayey soil is for the moist, the waxy, and the very opposite quality. That this principle appears correct from what has been stated and our will admit; but it receives demonstrative con-

firmation from the circumstance that it is only in what may be called the mossy parts of Lancashire that the superior potatoe is produced. In the neighbourhood of Ormskirk, in Aughton, Altcar, Formby, Scarisbrick, Bickerstaffe, and what may be called the north western coast of this county, from the beautiful and picturesque Lune to the agitated Mersey, the best potatoes are grown. In Speke and Hale, for instance, which may be said to join the line of demarkation already sketched, the soil alters; it is more inclined to clay, and the quality of the potatoe is changed also—it is decidedly inferior. A similar remark will apply to the southern part of the county of Lancaster generally.

And this notion is strengthened by the fact that when the land has been lately *marled*\*, the potatoe it produces partake much more of a waxy quality, than those grown under other circumstances.

In speaking of the superior quality of the Lancashire potatoe, the remark is intended to apply to the *pink eye*; calculated above all other kinds for the table from its dry mealy quality, and very superior flavour. What are called *cattle potatoes* (the oxnoble, for instance, and another kind or two) are not uncommon in the county of Lancaster, and used, as the name implies, as food for cattle. A much greater weight of these is produced on the same space of ground. While five hundred bushels per acre† is regarded as a good crop of pink eyes, nearly double that quantity is expected, and frequently obtained, from cattle potatoes; and it is hastily supposed that, as the bulk is so much larger, the benefit resulting to the farmer, in giving them to cattle must be in the same ratio. It is quite a mistake. They absorb, and retain more moisture than the pink eye; and, when sufficient pressure is applied, it will be found that the farinaceous matter or flour of the pink eye is nearly, if not quite, equal in bulk, and in quality far superior; so that the same money expended in pink eyes would be more serviceable to cattle, and consequently cheaper to the farmer.

It is very well known that the potatoe crop in Lancashire last year (1833) exhibited a great falling off—indeed it was an absolute failure. I had many opportunities of watching the progress of the crop; and when, at length, during the month of September, I crossed some hundred of potatoe fields, I was grieved to see the miserable appearance which was exhibited. In many inclosures not half the sets had vegetated, and many of those which had sprung into life, and produced a plant, appeared weak and sickly; and notwithstanding the unwearied efforts of the cultivator, in endeavouring to fill up the gaps with second seed, fields, thus circumstanced, presented a very unsightly appearance—they might give rise to irksomely interesting reflections, but produced no pleasing impressions on the mind. I traversed many fields where the crops were as healthy, as vigorous, and as flourishing as possible: and I found, upon examination and inquiry, that where these excellent crops appeared, the land had not been long broken up.

The prevalent system of cultivation in Lanca-

\* *Marl*, a sort of friable clay, is frequently laid on the light soils of Lancashire for the purpose of strengthening them.

† One acre of the Cheshire measure (which is used in Lancashire) amounts to a trifle more than two statute acres.

shire is the following: where a grass field is broke up, it is what is called *skimmed* at the latter end of the year; and this *skimming* consists in the top or turf, being cut (with an instrument made for the purpose, and used by a man) about an inch thick, which is suffered to lie on the surface of the ground till the following spring, when the ground is prepared for the potatoe seed by repeated ploughings. After the potatoes, wheat is sown, and the system of potatoes and wheat is frequently continued for many years in succession. It does not always follow, where a grass field is to be subjected to the operation of the plough, that the turf is skimmed in the manner already described; on the contrary, the field is ploughed in spring, and sown with oats, without any further preparation. Then follows potatoes, succeeded by wheat, when potatoes and wheat succeed each other as in the former case. The soil thus becomes weakened by proceeding too long with the same crops, and the exact same system. I am aware that dung is introduced with the potatoe sets to keep up the strength of the soil; but when we consider how the soil is *anatomized* every alternative year by the potatoe fork, reason would seem to say that it stood in frequent need of a crop of grass for the purpose of uniting, strengthening, and binding it together.

Hence it appears to me that the failure of the potato crop in Lancashire in the year 1833 is attributable rather to the erroneous system of the cultivation than the imperfection of the seed;\* since there was no failure or falling off in fields lately broken up, and it was only where the soil had undergone the operation of *minute dissection* every second year for a long period that the failure occurred or was visible. It may be asked perhaps, how it happened, that the soil of Lancashire, did not manifest the evil before 1833-4, as the *same system* has been practised for nearly half a century? The answer is, that the system is *similar*, but not the *same*. It has only been within the last half score years, that the land has been so harassed with the continued succession of wheat and potatoes. Prior to that period, the profits of the farmer were immense, and hay, as well as other produce, sold for a good price; clover, therefore, was more frequently sown, and the land more frequently laid down. But of late years the cultivators of the soil have, with great difficulty, been able to pay their rents; and were thus constrained to pursue that which appeared the readiest method of raising the money for that purpose.

If we reason upon simple or cultivated nature, either as regards vegetable or animal life, the preceding observations will receive strong corroboration or collateral confirmation. No direct descent in the same blood can be long continued, without a very visible deterioration; in the same manner, vegetable life droops, unless frequently assisted, not merely by manure, but by alteration of soil; or what might be called crossing the strain.

The potatoe crops of the present year (in Lancashire) present similar appearances to those of the year 1833; equally defective—from the same cause,—that which I have described, I entertain not the shadow of a doubt. It is true, the seed† was generally denounced by the farmers, and these complaints produced elaborate essays from some

\* To which the Lancashire farmers attributed it.

† The seed of the Lancashire pink eye potatoe is procured from Scotland, principally, if we are to believe the advertisement, from the neighbourhood of Campbelltown.

of the learned Thebans who import the seed potatoes into Liverpool; who were no doubt, superlatively happy in this being afforded so inviting—so fascinating—an opportunity of placing their delectable excogitations before the eyes of an admiring public.

Having asserted that the farmers blamed the seed, it may be justly remarked that they were anxious to shift the blame from their own shoulders, or rather from their own convenient and profitable system. Potatoes and wheat grown alternately in the way already described, are attended with the least possible labour. The cultivation of the potatoe crop prepares the ground for the reception of the seed wheat; and the Lancashire farmer is thus saved the labour of those repeated ploughings, which in most other parts of England are deemed indispensable, and which in an unpropitious season are difficult to accomplish.

The farmers of Lancashire are perhaps more illiterate than the same class in any other part of England; but no men in the world are more industrious. Their present situation is more favourable than that of their fraternity in any other part of the kingdom, arising from the number of manufacturing towns thickly populated, and spread all over the county. During the war, they were enabled to reap a golden harvest: potatoes were seldom under three shillings and sixpence per bushel, and rose occasionally to seven shillings, when the produce of an acre (supposing it to be five hundred bushels) would amount to 175*l*. Wheat during the same period, varied from 15*s* to 30*s* a bushel. These times are passed away: the Lancashire farmers sigh for their return:—but I am fearful, they sigh in vain.

*The best potatoes are the cheapest.*—Potatoes in Lancashire may be regarded as a staple commodity; or, in other words, they are an article of general consumption. They constitute the principal food of the working and lower classes; with the middle classes, they are the favourite accompaniment of every joint which appears on the table, almost to the exclusion of every other vegetable—they are substituted for bread. Great quantities of potatoes are given to milking cows and cattle during the winter; and even in summer, the former receive them twice a day (at each milking time) in what is called *Licking*\* potatoes are largely consumed by draught horses, and indeed by saddle horses also: a similar remark will apply to pigs; and even poultry are fed, for the most part, with them.

Referring to the observations already made respecting the pink-eye potatoe, and those which come under the description of cattle potatoes, and that the same space of land will produce a much greater bulk of the latter, than of the former, I must further remark, that the Lancashire farmers labour under a mistaken notion in regard to the use of cattle potatoes. It is a common remark amongst them, that the latter will do as well for cattle, horses, and pigs, as the pink-eye; and thus unreflectingly suppose, that, as nearly double the quantity is produced upon the same space of

ground, a great saving is thus effected. However, when we take into consideration, that this superior bulk of cattle potatoes arises from the greater quantity of water absorbed and retained by them, and that, in consequence of this very circumstance, the quality of the farinaceous matter is rendered inferior to that of the pink-eye, it becomes evident that the latter is preferable either as regards the human subject or his quadrupedal dependants; and that, consequently, the Lancashire farmers, pursue, in this respect, a very erroneous method—a system which proceeds in the inverse ratio of truth. That the above reasoning is perfectly correct, I am convinced from observation and practical experiment; and those who feel disposed to put it to the test in the same manner, I have no doubt will arrive at similar conclusions. A pig will thrive better on half the quantity of pink-eye potatoes, compared with ox-nobles, for instance; and the same observation will apply to cattle and horses.

It will be necessary to remark, that what are called pink-eyes do not constitute the early potatoes of Lancashire, of which there are several kinds, such as the kidney, foxes, &c. These are very fine for the table, considered merely as early potatoes, but they are superseded as soon as the pink-eye has attained something approaching to maturity.

The cultivation of early potatoes is rendered precarious in Lancashire from the uncertainty of the weather, and particularly from frosts. I have known frosts in the early part of the month of May to make dreadful havoc with the early potatoe crops; a sharp frost turns the tops black—it kills them in fact; and, when vegetation no longer proceeds in the tops or stalks of the potatoes, it ceases underground also: it is the sap or juice in the top (or what in the county of Lancaster is called *wysle*) which conveys nourishment to the growing root or potatoe underground; and therefore, when the nutritious supply has been annihilated or cut off, there can be no produce. The month of May is the season for planting the pink-eye potatoe, and it thus escapes the danger of frost.

The leaves of the potatoes sometimes appear shrivelled up, which the Lancastrians call *curled*; it is an infallible indication of a bad and diseased crop. Many of the farmers attribute it to too much dry weather; but this is a mistake, it arises from bad seed; and particularly from the farmers using their own seed; that is, seed grown upon their own farms. I tried the following experiment:—Upon the ground where the seed had grown I again planted it; the crop proved very indifferent; the leaves were curled, the potatoes small and scabby. I reiterated the experiment:—the tops were as sickly as possible, few potatoes were produced, those not larger than nutmegs, scabby and diseased beyond measure.

As food for milking cows, potatoes are superior to turnips, to mangel wurtzel, carrots, or cabbage. Mangel wurtzel fattens a cow at the expence of her milk; and its use is not unattended with danger. Some few years since I had a beautiful heifer which was allowed to eat unrestrainedly of the leaves of mangel wurtzel: they produced the same effect as wet clover, and the animal died.

T. B. J.

\* *Licking* is composed of sliced potatoes mixed with bran, of which each receives a portion at milking time—many of the cows will not allow their milk to flow till the licking is given them. Such a system would appear strange to a Leicestershire farmer; but it is not the less correct on that account; in no part of Great Britain do cows produce more, if so much, butter as in Lancashire.

A new tulip, rared by M. Patrix, a gardener at Ghent, and which the Society of Florists of the town has named the "Citadel of Antwerp," has been purchased by M. Vandernineck, a horticulturist of Amsterdam, who was formerly a Captain in the Dutch navy, at the price of 16,000 francs.

## TO THE EDITOR OF THE "MARK LANE EXPRESS."

Sir,—I have for some time past read your articles on the subject of Irish Poor Laws with some surprise, but have abstained from remarking on them, with the hope of being supplied with some tangible facts, which might be brought to bear directly on the practical understandings of your readers, and your paper of this date has furnished me with them, in the petition from Burishoole, presented by Mr. Sharman Crawford.

I beg your attention closely to the averments of this petition.

It states that there are "7,841 persons of the parish necessarily consigned from want of employment, to the alternative of dying by starvation, or of protracting existence by plunder, &c. &c.," and a few sentences lower, it gives the total rental of the parish, at 6,972l 7s 8½d. (From the exactness of the sum, even to a halfpenny, we may presume the writer had access to correct documents.)

Now, let a Poor Law be enacted, to entitle each of these 7,841 individuals to subsistence from the land of the parish, the entire value of which is 6,972l 7s 8½d, and when the assessment of twenty shillings is made, it will give about nineteen shillings per head to support the poor for a year; that is to say, about five farthings per day, for each pauper.

Here is the result of an entire confiscation of estates for the support of the poor in the parish, now pressed on the attention of parliament.

If starving able-bodied men, now confined to their own parish by want of a farthing to take them away from it, were to get a weekly allowance of anything marketable, is it not likely that they would carry their labour to the British market? A Poor Law would give them means to pay their passage, which they now cannot command, and would at once direct them to the seat of wealth and industry. I cannot understand the cause of that delusion which makes so many agriculturists believe that Poor Laws would keep the Irish at home. They stay at home now from a necessity, in many cases, which could not exist, if their families were supported by the parish.

I have the honour to be, Sir,

Your obedient servant,

"ONE WHO PREFERS FACTS TO ARGUMENTS."

## A LAPLAND SUMMER.

Including also what in other countries is called spring and autumn, consists of fifty-six days, as follows:—

|        |                              |
|--------|------------------------------|
| June   | 23, Snow melts.              |
| July   | 1, Snow gone.                |
|        | 9, Fields quite green.       |
|        | 17, Plants at full growth.   |
|        | 25, Plants in full blow.     |
| August | 2, Fruit ripe.               |
|        | 10, Plants shed their seeds. |
|        | 18, Snow.                    |

From this time to June 23, the ground is every where covered with snow, and the waters with ice.

A pamphlet in the form of a speech on the improvement of the River Shannon, in Ireland, has lately been sent to us. It does not bear the name of the author, but we understand it was written by Mr. C. W. Williams. The remarks it contains were suggested by what passed in the debate, on the 12th of May last, relative to Lord Kerry's motion on the improvement of the Shannon. The object of the writer is to show that, as had been generally admitted so long ago as 1794, the completing of the

navigation of that river and the great rivers adjoining, from Lough Allen to Limerick, would improve and open the home and foreign markets to the produce of more than 2,000,000 of acres of land in the heart of the kingdom, and moreover would advance the commerce, manufactures, agriculture, and population of Ireland. The author affirms, on the authority of all the evidence and reports on the subject, that the practicability of the proposed measure, and the extensive and national advantages that must ensue from its adoption, are unquestionable. In support of some of his allegations, he enters into a comparative view of the navigation of the Rideau Canal in Canada, and though he appreciates the advantages which are reaped from the labours and expenditure lavished on that canal, he deploras that an excessive liberality should have been exhibited on its behalf, while a policy the very reverse is adopted towards Ireland. Two maps are appended to the pamphlet in illustration of the author's view of the matter.

The more I am acquainted with agricultural affairs, the better I am pleased with them; inasmuch that I can nowhere find so great satisfaction, as in those innocent and useful pursuits. In indulging these feelings, I am led to reflect how much more delightful to an undebauched mind, is the task of making improvements on the earth, than all the vain glory that can be acquired, from ravaging it by the most uninterrupted career of conquests.—*Washington.*

## KING'S BENCH.

SHAW V. ROBERTS.

The ATTORNEY-GENERAL, with whom were Mr. KELLY and Mr. SHEE, stated this to be an action brought by the plaintiff against the defendant, representing the Norwich Union Insurance Company, to recover a sum of money upon a fire policy of insurance. The plaintiff had carried on business at Lynn as a corn-merchant, and had insured his premises in the sum of 1,400l, and the policy stated that there was a kiln on the premises for drying corn—the premium paid was 3s. 6d. per cent. In December last some bark was being dried on this kiln, when unfortunately a fire took place on the premises, and they were burned down. The plaintiff then applied to the Company to pay the amount of his policy, but they refused to pay him, and he was compelled to bring this action; he should produce the policy and should call evidence to show that the fire was accidental, and he should then be entitled to their verdict. The learned counsel designated this refusal of payment as a most ungracious act on the part of the Insurance Company. The learned Attorney-General then proceeded to produce the following evidence:—

The policy of insurance was then put in, and it particularly mentioned a kiln for drying corn.

Charles Goddard: I was clerk to the plaintiff; he carried on business as a corn merchant at Lynn.

Benjamin Green: I was employed in the kiln; I recollect some bark coming from a lighter and being put upon the kiln; I left the premises with some other men belonging to them about a quarter past five; we went to get our tea; when I left the premises they appeared to be perfectly safe; as soon as I saw the fire I went to the premises; a messenger was sent for Mr. Shaw, who lived two miles and a half off; we kept supplying the kiln with bark from time to time as it was required.

Cross-examined: the fire took place on 13th December: I removed some bark about 10 or 11

that morning, and the fire broke out about six in the evening; I never saw any bark dried before.

Re-examined: the first quantity of bark came on the 11th: the kiln had been recently built; the fire broke out in the granary.

Thomas Hart: I was in the employ of Mr. Shaw when the fire happened; before the time of the fire I never knew bark dried there; the whole place, and everything in it were burnt.

Cross-examined: I don't recollect whether the door between the kiln and the granary was of wood or iron.

This was the plaintiff's case.

Sir FREDERICK POLLOCK then addressed the jury for the defendants. There was no doubt the plaintiff had property on the premises exceeding in value the amount of the insurance but it was the duty of the defendants as regarded themselves and the public, to take care that they did not pay a loss for which they had never contracted a liability—against which, if they had anticipated it, they would have protested. The whole was owing to the plaintiff's obstinacy. His defence was this: In the policy it was stated that there was a kiln for drying corn, but that was never intended to be applicable to kiln for drying bark. The kilns used for these two purposes were totally different in their construction. A kiln for drying corn had small holes in the floor, but the kilns for drying malt had no such holes, because particles of the bark would go through the holes, and being of a nature something like touchwood, or tinder, would set the premises on fire; but in addition to that there was this distinction, that the insurance for a kiln for drying bark was 7s. 6d. per cent. whereas the insurance for a kiln for drying corn was only 3s. 6d. per cent. He should be enabled to establish in evidence that the kiln in question was constructed for the purpose of drying corn, and that bark was dried in that kiln, in consequence of which the fire arose. In point of law he should submit that the plaintiff was not justified in doing this, and could not therefore recover against the Insurance office upon this policy.

Allan Scott: I was kilnman to Mr. Shaw in December, 1832, and had been so for 6 or 7 years. The kiln was used for drying corn and seed; he was a corn-merchant; I never saw bark dried there before; a lighter loaded with bark arriving, the waterman of which came and asked me to dry it, I told him to go to Mr. Shaw; he saw Mr. Shaw, who sent for me, and told me to dry the bark. I told him I did not understand it, as I had never seen any dried. There were holes in the floor of the kiln, so that corn could lie upon it without going through the holes. I said it would require a cloth to be put over the fire, to prevent the dust of the bark going through the holes, as I thought an accident might occur. Mr. Shaw desired me to light the fire immediately, and he said that it did not require a cloth, and the bark was put on the kiln. When I went to tea on the day of the fire, I left the fire very moderate. On my return, I found the kiln was on fire; it spread to the granary. I cannot account for the fire happening.

Cross-examined.—The door leading from the kiln to the granary was wood; the door was shut when I went away. I believe I stated the conversation between Mr. Shaw and myself to Mr. Jarvis.

By the Court.—If any particle of the bark had gone through the holes, I should not think it would have taken fire; that's where I am done; but the floor is over the fire-place, about five feet above the fire.

John Whiteby.—I am a lighterman; Scott was

the first man at the fire. I was there soon after it broke out. I had been there all day turning the bark, and had only left the premises about an hour. The fire was in the middle of the kiln; the bark was on fire.

John Green, Agent for the Norwich Union at Birmingham.—There are kilns for drying bark as well as for drying corn; a kiln for drying bark is generally constructed with a flue round the room. The rate for insuring a corn-kiln is 3s. 6d. per cent.; the rate for insuring bark kilns is 7s. 6d. per cent.

Thomas Lewin.—There are kilns expressly constructed for drying bark with flues; there is no access between the bark and the fire.

Mr. KELLY then replied.

Lord DENMAN, in summing up, said the first question for the Jury was, whether the drying of corn by the kiln, and the drying of bark as it took place, were two essentially different things. The second question was, whether the drying of the bark, as it was taking place, was more hazardous than drying corn. The third question was, whether the drying the bark did not produce the loss.

The Jury retired for a short time, and then delivered a verdict for the defendant on all the questions.

## COURT OF EXCHEQUER.

ELCOM V. NASH.

Mr. BALL opened the pleadings.

Mr. KELLY stated the case. This was an action of trover for ten horses and two sets of harness, under the following circumstances;—A man named Lipscombe, who was coachman of the new Colchester coach to London, and who horsed that coach one of the stages, sold the horses in question, with two sets of harness, to the plaintiff, who was landlord of the White Horse, Little Britain, for 150*l*. Some little time before the sale a veterinary surgeon, named Pennington, had valued the horses on plaintiff's behalf, and a person named Cartwright, said the plaintiff paid the money on the 6th of August to Lipscombe at his own house, and Lipscombe's receipt for the 150*l* was proved. The plaintiff next day went down to Witford, in Essex, and took formal possession of the horses. After this Cartwright, a lawyer's clerk, drew up an agreement, by which Lipscombe hired the horses of the plaintiff at the rate of 6*l* per month, with authority to buy, sell, and exchange the horses for others, as he thought proper; but before doing so he was to consult the plaintiff, at whose house he lived while he was in London. Lipscombe had, under the agreement, again possession of the horses. In December last the defendant, who was creditor to Lipscombe to the amount of 138*l* for corn, pressed for the amount, and prevailed on him to sign a paper, which turned out to be a bill of sale of the horses and harness. Lipscombe stated he was not aware of the contents of the paper. The defendant soon afterwards took possession of the horses, after which Lipscombe gave a note for 50*l* to the defendant for re-possession of four of the horses, in order that the coach might not be stopped from running.

These being the facts of the case,

Mr. THESIGER, for the defendant, addressed the Jury, contending that the bill of sale was given for a *bona fide* consideration, and therefore the defendant had a right to the horses.

Lord ABINGER left it to the Jury to say whether the bill of sale was fraudulent or not.

Verdict for the plaintiff—Damages, 150*l*.

## NORTHERN CIRCUIT — LIVERPOOL. NISI PRIUS COURT.

HUTTON V. LION AND ANOTHER.

This was an action brought to recover 23*l*, being the amount of damages awarded by the decision of an arbitrator against the present plaintiff, and also the amount of costs incurred upon that occasion.

Mr. Alexander and Mr. Anderson appeared for the plaintiff; Mr. Cresswell and Mr. Crompton for the defendants.

It was stated that the plaintiff was the tenant of a warehouse in Liverpool, and that a Mr. Frankland was his landlord. The plaintiff had sublet a room in this warehouse to the defendants, who, employing it for the purposes of their business, had stored it with meal. After a few weeks, either from some defect in the construction of the building or from the weight being greater than it had been intended to support, the floor of the room occupied by the defendants gave way. Mr. Frankland, as landlord, repaired the premises, and brought his action against the present plaintiff to recover the amount of the expense then incurred. The matter was referred to arbitration, and it was decided that Mr. Hutton was liable for the amount.

On the part of the plaintiff witnesses were called, who gave it as their opinion that the room in question was only capable of sustaining the weight of meal piled to the height of four, or at the utmost five feet, whereas the defendants had filled it as high as seven feet, and that they had no doubt but that the excessive quantity of meal had caused the floor to break down.

For the defendants a number of witnesses appeared, who stated that it was the usual custom to stow as much in the warehouse as they were capable of containing, and that with reference only to their size, and not to their strength, which was always supposed to be equal to the greatest possible weight that they could contain; that the plaintiff was fully aware of the quantity of meal which the defendants had placed in the warehouse, for that, in consequence of the distance from which it was brought, he received a farthing for every load, and that he never made any objection that the weight would be more than his room could sustain. They also said that the quantity, 750 loads, would not be too much for a warehouse of the proper construction.

Lord Abinger summed up the case to the jury, who after a short consultation found a verdict for the defendants.

**MICE.**—A farmer, of Beame, who kept his corn on an unboarded floor, found it constantly devoured by mice. To remedy this, he plunged a number of earthen pots into the earth, all round the heap of corn; he filled them half full of water, and, being varnished within, when the mice came to drink they slipped in and were drowned. In the space of two months he thus destroyed 14,500.

The extraordinary number of upwards of 2,230 mice were a few days ago, killed from two wheat stacks, the property of Mr. T. Crowe, of Flamborough, which were being removed. The above number is independent of what were devoured by cats and dogs. The air of Flamborough must be of a prolific nature, as well as the sea.

In the nights of the 24th and 25th July (that is in the Dog Days) there was such severe frost in the neighbourhood of Riga that the haulm of the potatoes was frozen and turned quite black.

## TO THE EDITOR OF THE "FARMER'S MAGAZINE."

SIR,—Relief to the agriculturist can only be obtained by unity of purpose. It behoves us, (farmers,) when ruin is staring us hard in the face, to arouse every dormant energy to obtain an immediate and radical redress of those grievances under which at the present moment and for the last four years past we have been suffering to a most alarming extent, and since our distress has been admitted on all sides, no longer to be slumbering at our post, but to bestir ourselves before it be too late to make our voices heard in that place where alone any redress can be obtained. If we ever have thought that the submitting tamely to our present depressed condition, was the most likely means of obtaining that consideration which so numerous and respectable a class are justly entitled to, a sufficient time surely has elapsed to remove such blindness, and make us see clearly that we, and we only, must look to our own interest, that we must unite to be heard, that we must use every constitutional means to obtain that relief we so much stand in need of. Need I say that the press is the most powerful organ in our hand, and since we have now a magazine dedicated wholly to the agricultural interest, let us make it the means of communicating from county to county the exertions made by our fraternity, as a stimulant to still greater if necessary, to obtain a fair and impartial hearing; it is this which has induced the humble individual who is now addressing you to become a contributor to these pages.

We, (the farmers,) by being distributed over the country, a few in one parish and few in another, and meeting only perhaps once a week in any considerable numbers at some neighbouring market, when our time is chiefly spent in the business of the day, have not as yet, from the inconvenience attending it, ever been united for our own protection; but surely when we see our interest suffering in the way it now is, it is high time no trivial obstacle should deter us from using our most strenuous endeavour for the protection of our remaining property! Many persons who are unconnected with land, imagine that the relief the farmers want is to be obtained at the hands of the landlords in the shape of reduction of rents, but every tenant who keeps an accurate account of the produce of his farm, must be perfectly aware of the fallacy of such a supposition, for I am quite sure that on many, very many farms, if the whole of the rent were taken off, that then it would not leave the farmer a remunerating profit for his time and capital employed; if such be a true statement of facts, and I affirm it to be so, it clearly shows the utter inability of landlords to meet the times with their tenants, and the little tenants ought, comparatively speaking, to expect it at their hands. If our present depression were only a temporary one, resulting from some unnatural cause, we might expect shortly again to be placed in a more prosperous condition; but when the duration has been for the lengthened time it now has, with prospects still more lowering, it must carry conviction even to the most dull that it cannot proceed from any of the causes which have hitherto only produced this temporary depression, this will of course lead us to enquire from

what other source it does proceed; upon this there seems but one opinion, which I think must be quite conclusive, that the change in the monetary system caused by "Peel's Bill," has been the origin of all our troubles. If then our grievances are caused by an Act or Acts of Parliament, it is to Parliament, and Parliament only, we can look for any satisfactory redress of them. To the particular attention of Parliament we have such strong claims, as being the largest tax payers of any individual class in the kingdom, as the principal employers and supporters of the poor, as, in fact, the mainstay of the nation; and, if these were not sufficient, as the most loyal and patriotic of all his Majesty's subjects, and this I assert we are not from any vain boasting, but from very natural causes, that we draw our subsistence from the soil itself, our time and occupation is so mixed up with it, that it would be the height of degeneracy if it were otherwise. Then, surely, with such strong claims to attention, we need not be afraid to speak boldly, but temperately, or that if properly directed and zealously persevered in, our claims to the attention of the legislature will be thrown carelessly aside in the shameful way they have been. There seems to me but one way to effect so substantial a good, which is in the establishment of Agricultural Societies, only partially attempted in some counties. Yet the benefit these few confer on agriculture makes me wonder that so many counties should not earlier have followed the steps of their neighbours. If these societies became general, and as many as three, four, or five existed in each county, composed as they naturally must be of the agricultural influence and intelligence of it, nothing could or would have so great weight with the legislature as petitions from them, bearing on the face of them undeniable authenticity of the depression under which we labour. We cannot be surprised we have a deaf-ear turned to our complaints by those who are totally ignorant of agricultural pursuits, when we reflect, that we are proverbial for our grumbling dispositions. It remains therefore for us to shew by persevering in forcing our claims to attention, that now we need not seek for grounds of complaint. But if farmers will continue blind to their interest, and will not stretch a hand to relieve themselves, how can they expect others will attempt it for them?

#### A TENANT OF WESTERN SUSSEX.

August 19th, 1835.

#### THE ALDERNEY COW.

It is the opinion of those best informed upon agricultural matters, that the Jersey and the Alderney cow are precisely alike—both distinguished by the fine curved taper horn, the slender nose, the fine skin, and the deer-like form; and both preserved in their purity by breeding in and in.

Quail, in his report, truly says, that "next to the possession of *vraic* (sea-weed for manure and firing) the treasure highest in a Jerseymen's estimation, is his cow." It is now as it was in Quail's time. The cow is the object of his chief attention; and his care and affection for it may be compared with those of a German for his horse.

"It is true," says Quail, "that in summer she

must submit to be staked to the ground, but five or six times in the day her station is shifted. In winter she is warmly housed by night, and fed with the precious parsnip; when she calves, she is regaled with toast, and with the nectar of the island, cider—to which powdered ginger is added."

The high estimation in which the Jersey cow is held by its possessor, is shared by the island legislature, which has preserved the purity of the breed by special enactments. An act was passed in the year 1789, by which the importation into Jersey, of cow, heifer, calf, or bull, is prohibited, under the penalty of 200 livres, with the forfeiture of boat and tackle; and a fine of fifty livres is also imposed on every sailor on board who does not inform of the attempt. The animal, too, is decreed to be immediately slaughtered, and its flesh given to the poor.

The number of cows everywhere dotting the pastures of Jersey, add greatly to the beauty of the landscape: though when one passes near to them, the discovery that they are tethered, somewhat decreases the pleasure we have in seeing them. In apple-orchards, however, in which the under-grass crop is always used as cow-pasture, it is necessary to tether the animal; and not only so, but to attach also the head to the feet, that the cow may be prevented from eating the apples, which she would be quite welcome to do, were it not that they might injure her.

All over England, the Alderney cow, as it is generally called, is celebrated not only for its beauty, but for the richness of its milk, and the excellence of the butter made from it. Extraordinary milkers, even among Jersey cows, are sometimes found. I have heard of three cows on one property yielding each from sixteen to eighteen quarts per day, during the months of May and June; and of thirty-six pounds of butter being made weekly from their milk. I have heard, indeed, of one cow yielding twenty-two quarts—but these are, of course, extreme cases. The general average produce from Jersey cows may be stated at ten quarts of milk per day, and seven pounds of butter per week. It is stated that in summer from nine to ten quarts produce one pound of butter; and that in winter, when a cow is parsnip-fed, the same quantity of butter may be obtained from seven quarts—an extraordinary produce certainly. The profit on the best cows, the calf included, is estimated at about 12*l.*; 30*l.* being the money received, and the keep reaching 18*l.*: but this certainly applies only to the best cows. Two verges and a half, or somewhat better than an acre of good land, is considered sufficient for a cow's pasture. The price of Jersey cows has considerably fallen during the last fifteen years. A good cow may now be purchased for 12*l.*; a prime milker will fetch 15*l.*; and the average may be stated from 8*l.* to 10*l.*

GUERNSEY.—In this island, the cows are universally tethered, as in Jersey, and are moved, watered, and milked, three times a day. From about the beginning of November, during the winter, parsnips and mangel-wurzel are given to the cows at night.

There are few points of island jealousy carried further than that which regards the breed of cows of Jersey and Guernsey. It is certain, however, that of late years greater attention has been bestowed upon the breed of cattle in Guernsey than in Jersey; and the law forbidding the importation of any foreign breed, has been scrupulously acted upon. A Guernsey farmer would not, upon any account, admit a Jersey cow on his grounds. In England no difference between Guernsey and Jersey cows is understood; but the number of the latter exported being by far the greater, they are generally better known to the job-

bers. The Guernsey cattle are considerably larger than those of Jersey: and it appears from the evidence of the clerk of the market, that an ox has attained the weight of 1500 lbs. Quail, in his report, says, those of 1200 lbs., or sixty score, appear not unfrequently. I am told that a Guernsey cow, when its birth is distinctly known, and when offered among those best able to judge, fetches a higher price than the Jersey cow. This may possibly be owing to the larger size; for there can be no doubt, that greater size, supposing all the other points equal, gives the animal an advantage.

The following is the description and standard of excellence of a Guernsey cow, transmitted to me by one well versed in those matters:—The points of excellence are, 1. Pedigree of the parents; yellow ears, tail, and good udder. 2. General appearance; colour, cream, light red, or both, mixed with white. 3. Handsome head, well horned, and bright and prominent eyes. 4. Deep barrel-shaped body. 5. Good hind-quarters and straight back. 6. Handsome legs and small bone. I believe, however, that this classification of points of excellence is not rigidly adhered to. I have seen it stated of the Guernsey cows, young and old, that the general average is rather more than 365 lbs. of butter in the year, being equal to one pound of butter, or eight quarts of milk in twenty-four hours.

**ALDERNEY.**—In my rides I often paused and drew up my horse to look over the walls at the pretty little Alderney cows, whose beauty and qualities have so greatly distinguished their native island. My attention was particularly directed to some acknowledged as fine specimens; and to me they seemed well to deserve the praises that had been passed upon them. I found it, however, everywhere admitted, that there is but little distinction between the Alderney and the best specimens of the Jersey cow. The Guernsey cow, though also of the same breed, is (as I have observed) a larger animal, and, in the opinion of many, finer, though certainly not more comely.

I had been told in the other islands, that the true Alderney breed, such as I should find it in the Alderney, is black and white; but I did not find that the people of Alderney adopted this criterion of purity of breed. Red and white, and brown and white, I found equally common; and the choicest specimens shown me, were white and reddish-chocolate colour; but not with too great a preponderance of white. The Alderney people look more to the short curved horns, than to the colour: and it was stated to me by a gentleman who had paid great attention to the subject, that there is no indication of a true Alderney cow so certain, as prominent sparkling eyes; and in this the Alderney cow offers a strong contrast to other cows; for the eye of a cow is generally of a tranquil and sleepy expression. —Abridged from "Inglist's Channel Islands."

## ON FLOODING LAND.

(FROM SINCLAIR.)

The practice of flooding, under the name of "The Lock Husbandry," has been carried to great perfection in Livonia. It has there been ascertained, that it is a great improvement to have fish put into the water employed in flooding the soil. Carp is principally employed at the rate of from thirty to forty fish per acre. They are put in at from six to eight months old, and it is found from the fertility they produce, that the land will yield a third more in this way, than if the water had been without fish. The family of a great landed proprietor in Courland, (Baron Hoher,) owes its fortune entirely to this system. They have twelve fields appropriated for the purpose of flooding, four of which are constantly under water, and the other eight fields were cropped with grain, by means of which, an immense quantity of straw is annually furnished. This is an important acquisition in a country where they are obliged to keep their cattle constantly shut up in cow-houses for five or six months in the year.\*

## ON WARPING LAND.

There is no circumstance which proves more clearly the advantages to be derived from minute and extensive enquiries, adopting for their basis the political divisions of the country, than the discovery of the process called warping land. This most valuable species of improvement, applicable wherever tides in their course keep alluvial matters in a state of suspension, was confined to a small district on the banks of the Humber; and though it had existed there for about fifty years, yet not a syllable concerning it had ever found its way into a page of printed husbandry; and it might have remained unknown for many years longer had not the Board of Agriculture undertaken the survey of the kingdom, in the course of which it was brought to light.

In discussing this subject, it is proper to consider,—The origin of the practice;—The nature of the improvement;—The means of effecting it;—The season most suitable for the purpose;—The expense and profit;—The mode of cultivation and produce;—The situations where it may be attempted;—and, The improvements and the extent of which it is susceptible; together with some account of a species of river warping in Italy.

1. Origin of the Practice.—A species of warping has long been known in Italy; but the person who made the first experiment of warping in England, was Mr. Richard Jennings of Armin, near Howden, in Yorkshire, who tried it about the year 1743.† It was about the year 1753, before it was

\* An account of this curious practice was given me by the Baron A. de Meyendorff, a Livonian nobleman, in 1829, whose post town is Riga.

† When the political divisions of a country are made the basis of inquiry, no part of it is overlooked or neglected; and there is reason to expect, that every local useful practice may be brought to light, and ample information obtained, regarding the real state of a country, and the means of its improvement.

‡ Mr. Day of Doncaster, (West Riding, Report, p. 171), states that warping was first tried 'about 50 years ago,' and his information was given in 1793. Mr. Marshall was informed at Booth Ferry, near Armin, that one Barker, a small farmer at Rawcliff, was the first warper of land; and that Jennings, of Armin, was a steward of a professional person, who

The *Mémorial du Calvados* of the 14th instant states that the whole of that country is entirely burnt up by the extreme heat, and the rivers are so low that the mills have ceased to work. The greater number of the men employed at the Cotton-mills of Condé-sur-Noireau, amounting to between 2,000 and 3,000, are thrown out of work; at Falaise, water is sold at the rate of 50f. a tun: in several cantons of Brittany cider is given to the cattle to drink; and the horses of the dépôt at Bretteville, for remounting the cavalry, have been removed to Caen.

attempted by any other person; and it remained in obscurity till the beginning of November, 1793, when it was made public by three eminent farmers, who had been appointed by the Board of Agriculture, to draw up a report of the husbandry of the West Riding of Yorkshire. As the Board had only met for the first time on the 4th day of September preceding, the discovery of warping, in less than two months, is a striking proof of the zeal and activity of those appointed to carry on its inquiries.

2. The nature of Improvement.—The water of the tides that come up the Trent, the Ouze, the Dun, and other rivers which empty themselves into the great estuary of the Humber, is muddy to an excess; inasmuch, that in summer, if a cylindrical glass, from twelve to fifteen inches long, be filled with that water when the tide is high, it will presently deposit an inch, and sometimes more, of what is called warp, or a species of mud of great fertility. This substance probably originates from a variety of earthy particles, washed down by the rivers to their mouths, where they are mixed with saline and other fertilizing matters with which the sea abounds, and by agitation are rendered so fine, as to be suspended when the water is agitated by the tide. Some of it was analyzed by an eminent chemist, whose report was, that it contained mucilage, and a very minute portion of saline matter, a considerable quantity of calcareous and most probably aluminous earths; the residue mica and sand; the latter in by far the larger quantity, but both in very fine particles.

3. Mode of carrying the Plan into effect.—The plan of securing rich alluvial soil by embankments, has been practiced for ages; but it was reserved for modern times to conduct mud-laden waters, artificially, from the estuary or river in which they flowed, for the purpose of furnishing low and barren ground with a sufficient depth of fertile soil. The mode of executing the plan is extremely simple. When the improvement is determined on, the ground must first be surrounded with banks from three to four, six or seven feet high, according to circumstances, that the water may be of a proper depth on the land to be warped, and to prevent the contiguous lands, whether cultivated or not, from being overflowed. The tide is then admitted, and detained, until the sediment in the water is deposited upon the surface of the land. To render the plan efficacious,

extended the practice. Tradition says, that Barker, like other men of aspiring genius, hurt himself at the outset, (as is too often the case), by the prosecution of his scheme, which he was, in consequence, on the point of giving up; but laying his case before a friend, he advanced him fifty pounds, which enabled him to complete his grand design, by which he afterwards made a little money, so as to be able to forward his children's progress in life. One of his sons is now settled in business at Hull. Mr. Marshall very properly adds, that those who have made, or are making fortunes by this discovery, ought to ascertain who made it, and should lose no time in raising a monument to his memory. *Easter Department*, p. 197, note—"Mr. Wells, of Booth Ferry, near Howden, mentions it as a tradition, that the utility of this process was an accidental discovery. A stubble field was inundated with water from the river, and covered with mud. The benefit which the field derived from the enriching substances thus brought to it, was the cause of Mr. Barker's proceeding.

there must be a complete power over the water, either to keep it out, or to let it in; accordingly to accomplish these objects, there must be, not only a cut or canal made to join the river, but a sluice, (provincially clough), to open or shut, as required. The effect is very different from that of irrigation, for it is not the water which produces the effect, but the warp or mud; and the great object is, not to manure, but to create a soil of the richest quality, and that at a moderate expense.

4. The Season of Warping.—June, July, and August are undoubtedly the best months for warping on account of their being in general the driest seasons of the year. Land, however, may be warped in any season, provided the weather be dry, and the fresh water in the river very low. When the season is wet, and the river full of fresh water, this operation cannot be advantageously executed. The fresh water, in this case, stems the tide, and occasions a degree of stagnation, favourable to the repose of the prepared matter, and consequently it is not half so muddy, nor capable of depositing the same quantity of sediment as when the tide flows in more freely, and stirs up the mud. Warping in spring, is attended with no peculiar advantage, more than in summer, as there can be no crop the first year. The sediment must lie to soak and dry, before the ground can be cultivated.

5. The Expense and Profit.—Without ascertaining the situation of the lands proposed to be warped it is impossible to calculate the sum it will require to embank the lands, to build the *cloughs* or sluices, to cut the drains &c., and the quantity of land the same drains and cloughs will be sufficient to warp; for the greater the quantity, the less will be the expense per acre. There are *great quantities* of land, however, which might be warped for so small a sum as from 3*l.* to 4*l.* per acre; an expense trifling when compared to the profit that is derived from the operation. Mr. Webster at Bankside, in Yorkshire, purchased a farm of 212 acres, which he warped. The price was 11*l.* per acre, and the expense of warping about 12*l.* more, or 23*l.* in all. It was immediately rendered by warping worth 70*l.*, and, in some parts, even 100*l.* per acre, at which price warped land frequently sells; but even at 70*l.* the profit is immense. Mr. Webster warped some moorland, worth only 1*s.* 6*d.* per acre, (for such land there is in that neighbourhood), and could immediately let it for 5*l.* per acre.

6. The Mode of Cultivation and Produce.—The best mode of cultivating new warped land, is to sow it with clover, and to let it remain under that crop for two years, in order that it may be brought into a state fit for corn. It does not answer to sow land, immediately after it is warped, with wheat, even though fallowed; but after white or red clover, continued for two years, a good crop of wheat may be relied on, unless injured by the slug, which sometimes makes its appearance.\*

Nor is it proper when land is warped, to plant it with potatoes, or to sow it with flax, it being at first of too cold a nature; though these crops may answer, if the land be not too strong for potatoes, after it has been for two or three years in cultivation.

In the quality of warped land, there are most essential differences; some parts of the field being very strong, and others very friable. The land nearest the drain is, in general, the lightest,

\* Their depredations might be prevented, by salt strewed on the surface after the crop was sown.

owing to the quantity of sand that is deposited as soon as the water enters the field; the land farthest from the drain is in general the best. The produce of warped land varies much; but, in general, it may be stated, of wheat, at from 20 to 40 bushels; of beans from 35 to 50, and in some rare instances even 80 bushels; and of oats from five to eight quarters per acre. Warped lands require manure, and will not carry many crops without its aid, even where the situation is dry, and the soil fertile.

7. Can the process be extended?—Some doubts are entertained, whether the great repository of highly prepared matter in the Humber, may not be exhausted. But there seems no just ground for such apprehension, when the great extent of the estuary in which it is found, and the vast tract of country, which, for ages, has been pouring down these valuable substances into its bosom, are considered. At the same time, it would be desirable to remove every doubt of that sort, by as accurate examination of the banks or the bed of the river and the shoals in it, as is practicable in such cases. If upon inquiry it should be ascertained that the quantity of warp is as immense, as there is reason to expect, it is to be hoped, that such a treasure, in value equalling any of which the country is possessed, will not be neglected. We have the means in our power of converting land worth only a few pence, to land worth 5*l.* per acre per annum; or in other words, of transmuting copper into gold. The efforts made in Egypt to obtain, and to secure the fertility of its soil, in circumstances not very dissimilar, are well known; and shall nothing be done by the British Government to promote an imitation of the husbandry of the Nile on the banks of the Humber, and of other rivers where it may be found practicable? Why not give some species of public encouragement to so great a national object? more especially as the valuable substance in question, (silt or warp), is not confined to the Humber, but is to be met with in great perfection and abundance, in many of our other rivers and arms of the sea.

8. Of River Warping in Italy.—From some later accounts which have been published of the agriculture and statistics of Italy, it appears that a species of warping has been long known in Tuscany. It is there called *colmata*. The rivers in that country carry down with them vast quantities of mud and sand, by which their discharge into the sea is impeded, and great marshes are formed, not only at the mouths of these rivers, but in their courses, when they are passing from one level to another. Torricelli, it is said, was the first who taught his countrymen to enclose the marsh with a dike or embankment;—to admit into this inclosure the water of the rivers;—to force this water, by means of sluices, to remain stagnant as in a lake, so as to deposit its mud;—and by the sediment so produced, to raise the level of the bottom. At one time, three or four inches of earth have been often deposited;—the operation has been several times repeated in the course of a year;—and the level so much raised, that the ground is no longer liable to be overflowed by the river. The soil thus acquired, is of the highest fertility; and an instance is mentioned, of a piece of ground thus treated, which had yielded 25 measures of wheat from one. Necessity was the parent of this operation in Italy; whereas, on the banks of the Humber, it seems to have originated from accident, and has been carried on by a zeal for improvement, and the prospect of gain.

## THE BARLEY-MOWER'S SONG.

BY MARY HOWITT.

BARLEY-MOWERS, here we stand,  
One, two, three, a steady band;  
True of heart and strong of limb,  
Ready in our harvest trim;  
All a row, with spirits blithe,  
Now we whet the bended scythe.

Side by side now, bending low,  
Down the swaths of Barley go;  
Stroke by stroke, as true's the chime  
Of the bell, we keep in time;  
Then we wet the ringing scythe,  
Standing 'mong the Barley lithe.

After labour cometh ease,  
Sitting now beneath the trees,  
Round we send the Barley wine,  
Life-infusing, clear and fine;  
Then refresh'd, alert, and blithe,  
Rise we all and whet the scythe.

Barley-mowers must be true,  
Keeping still the end in view  
One with all, and all with one,  
Working on till set of sun;  
Bending all with spirits blithe,  
Whetting all at once the scythe.

Day and night, and night and day,  
Time, the mower, will not stay;  
We may hear him in our path,  
By the falling Barley swath;  
While we sing with voices blithe,  
We may hear his ringing scythe.

Time,—the Mower, cuts down all,  
High and low, and great and small;  
Fear him not, for we will grow  
Ready, like the field we mow;  
Like the bended Barley lithe,  
Ready for the whetted scythe.

## TO THE EDITOR OF THE NORWICH MERCURY.

Glynde, near Lewes, 29th July, 1835.

SIR,—Believing an account of Lewes Wool Fair will be acceptable to many of your readers, I have great pleasure in informing you that a great deal of business was done, and at prices quite as good as was anticipated. I sold mine, consisting of about 750 ewe and two-year old wether fleeces, and about 640 hoggets, at 5*s* per tod of 32 lbs, which is rather more than 1*s* 7*d* per lb ewe and hogget together. Calculating the ewe and wether at 1*s* 5*d* and the hogget at 1*s* 10*d* will be as near the price as may be. Many other lots were sold at 1*s* 6*d* per lb ewe and hogget together, which is the customary way of selling with us—lots consisting of about three-fourths ewe, one-fourth hogget. I know not whether Mr. Baldrey has inserted in your last a letter similar to the one in the Norfolk Chronicle, which was forwarded to me, but thinking it probable he may have done so, I will only add, that yesterday I saw the person who was reported to have sold his wool previous to Thetford Fair in 1834, and which on being asked as to prices in Sussex, I only stated as report, and it was strictly true. So that what possible grounds Mr. Baldrey could have for the gross attack on my veracity at the last Thetford Wool Fair, I am quite at a loss to discover. The quotation Mr. Baldrey

makes of what was said by me at Thetford in 1834, states clearly that I only spoke of it as a single instance, and that not with certainty, but which has proved to be a correct report, as the lot of wool was sold at 2s per lb. I cannot omit this opportunity of thanking most sincerely the noble-minded chairman of the Thetford Wool Fair, T. W. Coke, Esq., of whom your county may be truly proud for his kindness in defending me against the attack made on me that day—and will only add, that notwithstanding the sneer made by Mr. Baldrey against me for attending at Thetford, so long as my conduct is viewed, as I trust it is, by the gentry and yeomanry of Norfolk and Suffolk, and which indeed *their kindness the other day so well evinced*, I shall hope to be present at Thetford Wool Fair the next and many following years, even though by so doing I may incur the displeasure of Mr. Baldrey.

#### A PRACTICAL FARMER.

### PROPOSED EXPERIMENTAL FARM.

Some months since I published "Suggestions" as to an Experimental Farm, with a view of directing the attention of Agriculturists to the advantages which would result from an establishment of that nature, conducted upon scientific principles. Those "Suggestions" were intended to be submitted to the Highland Society. But it will be observed, by turning to page 10, expressly stated, that "*before presenting*" the Suggestions "to the Highland Society, the author" thought it "necessary to lay them before his brother Agriculturists, that they may have it in their power to testify the value and importance they attach to an Experimental Farm;" and subsequently advertisements appeared in several of the Scottish newspapers, intimating, "in order that the sense of Agriculturists, regarding the efficacy of the measure, may be more effectually known, it is proposed to prolong the period for returning the 'Suggestions,' with the names of the approvers annexed, till 31st December next." Thus it was evidently not contemplated to bring the subject under the consideration of the Highland Society, till its January meeting, when the sense of the country would, in some measure, have been obtained; my feelings of surprise and mortification may therefore easily be conceived, when, in a distant part of the sister kingdom, I read the decision of the Society on a question which, if the Directors had either perused the "Suggestions," or the advertisements already referred to, they must have seen was not before them. I do not mean to find fault with the noble Duke, who, doubtless from the most patriotic motives, called the Society's attention to the subject sooner than I wished; on the contrary, I would rather be inclined to give his Grace credit for his anxiety to promote the great interests of agriculture. Nor do I blame the Directors because they have not approved of my scheme, but I do think their decision was come to without the whole bearings of the case being fully considered, or the sense of Agriculturists fairly ascertained. As the opinion of the Society, thus prematurely given, may have the effect of leading many, who otherwise approved of the principle of an Experimental Farm, to deem the scheme now hopeless, I feel compelled, though reluctantly, to call on Agriculturists not to despair because an unfavourable decision has been published, but rather to use increased energy to attain so desirable an object; and to convince those who may be in any degree

sceptical as to the practical utility of such an establishment, I shall attempt to point out a few of the more obvious benefits likely to result from it, in the hope that every man will judge impartially for himself, and say, whether these advantages do not far outweigh the difficulties of the Directors of the Highland Society.—But before adverting to the benefits to be derived from an Experimental Farm, I beg to offer one or two remarks on the report of the Directors, as it appeared in the public journals. Those honourable gentlemen seem

"With one hand thrusting from,  
With the other pulling home,"

for, in one sentence, they state that an Experimental Farm is "*inconsistent* with the plan of the Society, which is, not to be itself the experimenter, but to encourage, stimulate, and in some cases to remunerate those who are about to make, or have made, experiments." Yet this same report concludes by telling the public, that "if an Experimental Farm, on a well digested plan and moderate scale, should be thought an advantageous adjunct for the investigation of certain phenomena, of which cases may perhaps be conceived, offering a too uncertain or too remote chance of advantage for individual speculation, the means of carrying it on being procured and placed at the disposal of the Society, they would do their utmost to make the scheme conducive to the public advantage." This appears to me like blowing cold and hot in the same breath. The whole extent to which my suggestions went, was to direct attention to the subject; and if the general feeling was favourable, then a plan would have been digested. But the Directors, while they admit that there may be cases in which the investigation of certain phenomena may be too uncertain for individual speculation, which, by the bye, is almost conceding the whole point at issue—they do all in their power to crush the embryo scheme. The Directors assert that an Experimental Farm "must, under any circumstances, be conducted at a great expense, its objects being, in a great measure, incompatible with attention to profitable return from its operations." To a certain extent this is true: but the Directors are surely not aware of the fact, that although the experimental garden of the London Horticultural Society cost upwards of 20,000*l.* to establish, it now not only pays current expenses, but is liquidating its debt by upwards of 1,000*l.* per annum, and why should a different result be anticipated in an Experimental Farm? Every agriculturist knows that high prices are paid for superior descriptions of seeds: and where would the agriculturists buy with equal security, as from an institution where he was certain that nothing would be sent forth that was not superior; and the reasoning which applies to seeds, applies still more forcibly to animals for breeding, inasmuch as the propagating of superior stock is the most important part of rural economy. I am far, indeed, from undervaluing the information collected and published in the Society's reports; but the Directors require not to be told that what a man sees going on before his eyes makes a more lasting impression than any thing he reads. It may be here remarked, that in an establishment of this nature, profit can hardly be taken into account. An Experimental Farm would be, in fact, an adjunct to the agricultural class in the University. It would be a school in which the Professor could apply the principles of his prelections in a way to produce the most lasting impression on his pupils:—it would be an establishment from whence stock and

seeds could be procured, the kinds and qualities of which had been fairly tested; and although not one farthing of profit was realized directly, such incalculable benefits would flow from it as would soon far outweigh any trifling shortcoming that might occur.

To prove that a farm, upon the principle pointed out in the "Suggestions" to the Highland Society, is a desideratum, I shall, in the first place, endeavour to show the advantage of such an establishment in improving the present stock of cattle in the country.

This important branch of agriculture has no doubt met with great encouragement from many enterprising individuals, and not unfrequently much progress has been made in producing fine animals; but those who have hitherto directed their attention to this department, acting as they necessarily must have done, without either concentration of purpose or unity of design, have laboured under many disadvantages, which it is altogether impossible for the detached exertions of individuals so operating to overcome. From the want of properly authenticated data, and registered facts, each individual improver had to commence and perfect a system for himself, without being much enlightened by the experience of those who had preceded him, and hence comparatively little has been effected in diffusing a general improvement in this department of rural economy throughout the country. Besides, the enterprising spirit occasionally displayed by individuals, too frequently ceases with themselves, and the stock so carefully cultivated under their own immediate superintendence, is allowed to degenerate, from the inexperience and neglect of those whose property they subsequently become. Thus, in a few short years, not a vestige remains of a once valuable breed. In alluding to what has been accomplished by individual exertion, I would beg to be understood, not as wishing to disparage, but rather to praise those exertions—the wonder being, not that so little has been achieved, but that so much has been effected in circumstances both adverse and dispiriting.

To remedy those disadvantages, which had been long felt, local associations now generally and liberally encouraged in the agricultural districts of the country, began to be established, and though the beneficial effects resulting from these are but partial and limited, and by no means commensurate with the expectations of their founders, they have unquestionably had a good effect in proving what can be done in fattening and in pointing out more distinctly the comparative merits of the different animals.

The great desiderata and essential elements of all improvements are therefore evidently wanting,—co-operation and union. Such has been partial, not because the energies of the country are unequal to the task, but because its strength has been divided and its efforts detached; and it appears a matter of no small astonishment that some such establishment as that advocated in the "Suggestions" has not been long ere now exclusively set apart for this purpose, more especially when it is recollected that every individual or company of individuals who have, for any length of time, devoted practical attention to the improvement of their breeding stock, have generally succeeded in their efforts, and in realising very high prices.

From the defects at present existing, the necessity and advantages of such an establishment are sufficiently apparent—both as respects improving

and renovating the present inferior breeds, and securing to the country a constant and permanent supply of the most improved sorts; for if once a proper breeding stock were obtained, superintended by properly qualified persons, whose whole attention should be to this particular department, and if no animal was suffered to leave the establishment without the sanction and approval of a committee of management and the manager himself—there would be an annual issue of animals, of a highly improved and useful character, which, by caution and perseverance, would be the means of displacing the coarse and unkindly breeds, which, at present, constitute such a large proportion of the cattle stocks in Scotland. To this grand depot every breeder could repair—and on the stock issued or the information gained, he could rely. From the publicity that would be given to every circumstance connected with its economy, from the register of well-authenticated facts that would be periodically and regularly issued—whether as regarded the failure of any particular mode of management, or its success, rural science would assume a certain and systematic form hitherto unknown, and a diffusion of sound practical knowledge would ensue that could not fail to be attended with the most beneficial results. All the advantages likewise of union and co-operation would be secured—the grand parent society taking the lead, would point out the road to success, and assist local associations and individual breeders. Such an establishment would likewise be of vast importance in dispelling the crude and contradictory opinions that prevail to such an extent in this department of agriculture, for it is a well known fact, that almost any system, no matter how absurd or ridiculous, can boast of its supporters and partizans. For instance, while the great majority of breeders (in theory at least) appear to deprecate what is called breeding in and in, they propose remedying the obvious defects of the existing breeds by adopting the very opposite extreme—a method no less prejudicial than the first. The truth in this, as in most other cases, will be found removed from either extreme. While, with its warmest opponents, we condemn the practice of breeding in and in, we are also of opinion that too great a disparity between the sexes, should be as carefully avoided, it being well ascertained that the greater the difference between the sire and the dam, the greater will be the uncertainty of the symmetry, feeding qualities, and general character of their offspring. All this, however, by the method we propose, would be brought to the test of experiment; prejudice and error would necessarily give way to fact, and a system of treatment, based on reason, would gradually extend itself to the remotest corners of the country, instead of a matter of moment being left to the direction of accident or caprice, as has hitherto generally been the case.

If the opinion alluded to in the preceding paragraph be founded in fact, we may conclude that the improvement of the present deteriorated class of animals, with which the country is stocked, will not be so speedily accomplished as the generality of breeders may suppose. If extreme crossing must be avoided, and almost imperceptible changes superinduced upon the existing stock, it is not difficult to foresee that a series of years must elapse before the defects which have been transmitted by every successive generation, can be eradicated, and stock brought to that state of perfection of which it is susceptible. If we are to foster, not to force, it will not be by any sudden

movement that the wished-for amelioration is to be accomplished, but by a succession of nice and delicate operations, requiring not only time, but caution and perseverance to conduct to a successful and satisfactory conclusion. These, as has already been mentioned, are entirely beyond the reach of individual or local exertion, and can only be attained by the patronage and countenance of some such influential body as the Highland Society of Scotland, and these certainly are subjects, whether we look to the variety of improvements contemplated, or the ultimate benefits accruing to the country at large, worthy of attention and liberal support.

As a powerful inducement to embark in this scheme of improvement, it may be remarked, that from the year 1710 to 1830 the average increase on the weight of the cattle at Smithfield market has been estimated at about two-fifths. If so much then has been accomplished by individuals in circumstances so adverse and discouraging, the improvement that would ensue from the formation of an Experimental Establishment would be almost incalculable; and now that an additional field of enterprise has been opened up by Scottish Agriculturists feeding off, and sending their cattle direct for the London market by steam, instead of disposing of them to English dealers, and having them fattened on the rich pastures of the sister country, it is evidently the interest of all, who are in any way connected with land, whether as proprietors or tenants, to have the present coarse and unkindly breeds displaced, and others of a superior character introduced.

In conclusion, we would observe, that although an accurate estimate of the increased value of an improved stock, would involve a variety of details, and some very nice calculation, which it is at present out of our power to furnish, still it is satisfactory to know the opinion of practical men in regard to this subject throughout various parts of the country. The opinion of many eminent farmers who have had considerable experience in the breeding, and particularly the fattening of stock, has been obtained, and all agree in stating that if it were in their power to fill their stalls with well-assorted animals instead of their mixed stock, which necessity alone obliges them to take, it would at least be one pound per head in favour of the country. In some districts they admit, where the breeding of stock has been more particularly attended to, the difference would not be so much, but in other districts the difference would be greater. Now, take the annual number of cattle killed in Scotland, along with the quantity sent to England, and the gross number will not be found less than 300,000, which at one pound per head, would give an increase of value to the extent of 300,000*l*, and this estimated increase is supposed to take place in the five or six months of feeding. If the country is at present annually receiving this sum less than it would do by having a proper stock of cattle, it would certainly be of immense consequence to have the matter rectified as soon as possible, and we consider no plan better calculated to ensure such result to the country than an establishment from which an improved superior breed could at all times be commanded.

I may at a future period direct public attention to the advantages likely to result from the establishment of a breeding stud, as a portion of the economy of an experimental farm.

A SCOTCH FARMER.

## REMEDIES FOR THE DEMORALIZATION OF THE AGRICULTURAL POPULATION.

TO THE EDITOR OF THE LINCOLNSHIRE CHRONICLE.

SIR,—You are entitled to grateful thanks for the insertion in your paper of the 17th inst, the extract from the *Farmer's Magazine*. I have never chanced to meet with that publication, but for years I have raised my single voice against the mischievous system among farmers, towards their servants and labourers, in having discontinued boarding and lodging their single men under their own roof. I rejoice at every means towards returning to a better order of things; and, by giving wider circulation to the suggestions in the *Farmer's Magazine*, you have most usefully employed your pages. Perhaps, however, an extract so long may have been passed over by some of your subscribers, without reading; and I address you on the subject in this short letter, that, if you print it, it may again refer your readers to the extract; drawing the attention of those who have not read it, and inviting the further thoughts of those who have already perused it.

I entirely agree with the writer in the Magazine that "the great cause, if not the sole cause, of the deplorable state of the agricultural districts, has arisen from the system of the farmer discontinuing to board and lodge their men in their houses;" but if no one "will venture to doubt this truth, I would earnestly caution the farmer from casting the responsibility from himself upon his landlord, or postponing the remedy until some other person has done some other thing towards it. From this evil plan which "has worked so badly," has grown up the loss of morals among the poor, and consequently the loss of morals among the rich; and all the worst features in the administration of our poor laws;—the separate rate of wages for the single and married;—(a most wicked and unjust distinction, for wages are the reward of skill and industry, not the measured dole to situation, nor to the wants of the workman);—the payment of wages out of poor rates;—the call for public-houses and beer-shops;—false principles;—undue combinations;—and more than all these latter, the chain of social order has been robbed of its principal link, and society has become disorganized, and is fast passing to dissolution.

In such a state of things, let not the farmer cast the responsibility from himself upon his landlord, nor postpone the remedy until premiums are offered, or additional buildings erected, or other measures taken:—it is the great mistake of the present day, the great error in all personal reform, that we desire our neighbour to do well, but we desire to excuse ourselves. The landlords on their part have, by lessons of the same severe experience as have visited the farmers, to retrace false steps; to restore small farms upon their estates;—to abolish board wages in their families, as means to restore society to a healthy state. Let "the happy farmer's boy, inexperienced in vice, the picture of health and contentment," know that the farmer can reward faithful service by providing a cottage and garden to the married adult labourer, who has lived in his house; and let the married adult labourer know that the landlord can reward skill and industry by letting a small farm to the experienced and thrifty cottager, and much will be effected towards restoring the moral character of the agricultural population:—far more good than

can ever be accomplished by any display of liberality by landlords on their rent-days, in, what is termed "voluntary reduction of rents," to be afterwards recorded in the newspapers;—a public degradation of the farmers, and a condemnation of the landlords themselves, in having set higher prices on their lands than they can venture to exact;—far more good than agricultural societies or premiums, (useful as I admit these to be)—far more good than all the legislative enactments, which a hundred parliaments may pass in a hundred years!

Only let not the farmer postpone the remedy, the landlord will build the lodging-room, when he finds the labourers are *in the house* to require it.

Yours, &c, 665.

### WILTS AGRICULTURAL SOCIETY.

The anniversary of this Institution was held on Wednesday, July 15th, in Devizes; and on no former occasion since its establishment, was there a more numerous attendance. There was also a fine exhibition of cattle, and a greater competition for the premiums than usual. At about four o'clock, a large party partook of a splendid dinner at the Bear Inn, served up in a very superior style, by Mr. Lord, the new landlord. Mr. Bennett, as usual, filled the chair, and among the company were, Mr. Locke, Mr. Neeld, Mr. Estcourt, Rev. Mr. Goddard and son, Rev. Mr. Ashe, Mr. O. Codrington, Mr. Hughes, Mr. F. A. S. Locke, Mr. S. Neate, Mr. Tylee, Mr. Atherton, Mr. Mayne, Mr. G. E. Sloper, Mr. Budd, Mr. Legg, Mr. Shepherd, of Swindon, Mr. W. R. Brown, Mr. A. E. Saunders, Mr. Young, Mr. S. Mills, &c. &c.

As soon as the cloth was removed, the following toasts were drank in succession:—The King—The Queen and Royal Family—The Navy and Lieut. Budd.—The Marquis of Bath, the Patron of the Society, and thanks to him for his donations, and for his annual present of a Buck—The Marquis of Aylesbury, a great promoter of the interests of the Society.—The Lord Lieutenant of the County—The High Sheriff—Lord Suffolk and the Wilts Militia, and Capt. Goddard. Mr. BENNET then said, that in proposing *The Church*, he would connect with the toast the name of a gentleman who was beloved and respected by all who knew him, who was an old friend to the Wiltshire Agricultural Society, and who was also an ornament to the church, of which he was a Minister—he meant the Rev. Mr. Ashe—drank with three times three.

The Rev. Mr. ASHE said, if he should express himself inadequately he could assure the company that he was not the less sensible of the compliment which had been paid him. It was a source of great pleasure to be assembled with gentlemen for the purpose of promoting the objects of a Society, in which, though persons of all political grades might join, politics were not suffered to enter. Here the tumults of elections, and the squabbles of the hustings, were forgotten; and whatever differences of opinion on other subjects might be entertained, all parties to-day were met for one common object, to promote the cultivation of the soil. He felt the high honour of having his name connected with the church; and he could assure the company that the Ministers of that Establishment had no wish to receive testimonies of approbation any longer than they deserved them by doing their duty. Before he sat down, he begged to propose the health of a gentleman under

whose presidency the Wiltshire Agricultural Society had flourished for a great number of years;—who had lent his fostering hand to it in its infancy—who had watched and protected it to manhood—and who, if he should live to see signs of its old age, would double his support in order to sustain it. Without further preface, he proposed the health of the Chairman, Mr. Bennett.—Drank with three times three and three times three.

Mr. BENNET rose, but it was some time before he could be heard; each renewed effort to speak, appeared to excite to renewed cheering. Nothing could exceed the enthusiastic manner with which the toast was received.—After sincerely thanking the company for their kindness, the hon. gent. said.—He could assure the company, that no one was more attached to agriculture—no one was more attached to his country, and on the prosperity of agriculture depended the prosperity of the country—no one was more attached to Wiltshire and to Wiltshiremen than he was. There were those who attended public meetings merely from a sense of duty, and were glad when that duty was over; but he attended the Wiltshire agricultural meeting from a very different feeling. He looked forward to it with a degree of pleasure and anxiety that he could not adequately express, and he was never more gratified than when surrounded by those friends who generally attended that meeting. He would willingly make some observations as to the prospects of agriculture; but he could say nothing that was cheering. He would advise them, however, to persevere, and rely upon Providence for the rest; and he was assured that Agriculturists could display a spirit of perseverance under circumstances of depression, which would be almost sufficient to turn the most resolute from their purpose. The agricultural interest of the country could not be destroyed without some great revolution, which for a time would annihilate all interests; but he apprehended no crisis of danger. The native energies and good sense of Englishmen would enable them to overcome all difficulties. It was true that a large number of persons connected with land had been entirely broken down by the heavy burthens they had to sustain, and he feared that many more would drop; but still he trusted that better times would arrive. There was a great difference of opinion regarding the present Corn Laws; some thought that a fixed was better than a fluctuating duty, and he at one time had been among the number, but he had lived to see his error. Whatever their opinions might be, they had better not quarrel with the present law, and by that means throw themselves into the hands of their enemies; rather keep the good they had, than trust to that which they knew not of. Besides, whilst British Corn continued at such low prices, the present Laws acted as a direct prohibition to the importation of foreign grain. With regard to Taxation—the hon. gent. said, he had always been a strong advocate for the repeal of the Malt tax, and he thought that the landed gentlemen grossly deceived themselves, when they supported the reduction of the beer tax rather than that of the Malt-tax. That the Malt-tax produced an immense revenue there could be no doubt, and if it were taken off to-morrow, under the present debt of the country, some other tax must be laid on in lieu of it; but it was much more easy in the present House of Commons to repeal a tax than to impose one: in his opinion, it would be a very difficult matter to renew the beer-tax. He, however, could honestly vote for a repeal of the Malt-tax, as he was ready to substitute a Property-tax in lieu of all

those taxes which bore on productive industry. Government expected that the Agricultural interest would be greatly benefitted by the alteration in the Poor Laws, and they had taken the complete controul of the poor into their own hands; but in his opinion they ought to go farther, and take upon themselves the paying of them too. What reason could be assigned why every one should not contribute to the forced Charity—the Poor Rates? Why should the landed more than any other interest be peculiarly subjected to the burthen? Government having the controul of the public money, he would urge that the poor should be paid from that money. A substantial relief would then be afforded to both landlord and tenant; for each was experiencing difficulties that no others laboured under. As to a reduction of rent, it was well known, that rent in some places formed so inconsiderable a portion of the farmer's expenses, that it would be impossible to give him adequate relief from that source, even if his landlord relinquished his claim to nearly the whole of the rent. No reduction of rent, generally speaking, could enable the farmer, at the present depressed prices, to cultivate the soil and pay the expences. Landlords and tenants then should unite together for their common interest, and endeavour, if possible, to obtain some direct relief from Government; at the same time bearing in mind, that it was absolutely necessary for the welfare of the country that our Institutions should be strictly maintained. After a few more observations, Mr. Benett sat down, amidst loud and reiterated cheering.

"The Members for the Borough of Devizes" was the next toast proposed, which was drank with applause.

Mr. LOCKE, in returning thanks, said, he fully concurred with the sentiments so ably expressed by his friend, Mr. Benett. No one could be a more sincere friend to the Agricultural interest than he (Mr. Locke) was, and he would use every exertion to promote its welfare. He, too, would support a property-tax, because he believed it to be the most equitable tax, and it would be the means of transferring the burthen from those who were ill able to sustain it, to those on whom it ought to fall. (*Loud cheers.*)

"The Members for the Northern Division of the County"—(*drank with cheers.*)—"The Members for Chippenham"—(*reiterated cheering.*)—Mr. NEELD, in expressing his acknowledgments, said, he did not feel that he deserved the kindness which had been evinced towards him. It was true, he had come from town purposely to attend that meeting; but he had done no more than the worthy President, and the excellent representative for Devizes. He could however have wished that it was not so much the fashion to keep the representatives so long in town; for he was confident that at this season of the year they could be of far more service in their respective districts than in the House of Commons. He thought that Associations like the one they were met to celebrate, were productive of immense benefit; they were calculated to draw still closer the bond which it was most desirable should, and he hoped ever would, exist between the landlord and tenant, and between the tenant and the labourer who tilled the soil. It was by such Associations that our national industry received new directions, and went on in the way of improvement. It was also by such associations that our national wealth was increased. Although he was no practical Agriculturist, he would do all in his power to further the objects of the Wiltshire Agricultural Society.—(*Loud cheers.*)

Mr. DAVIS proposed as a toast "The Members for

the Southern Division of the County."—(*Drank with loud applause.*)

Mr. BENETT returned thanks, and said that an honest independent Member of Parliament had no difficulties to contend with. His path was clear: he had only to exercise his judgment, and to vote according to his conscience for those measures which, in his opinion, were most conducive to the real interests of his country. He (Mr. Benett) held certain principles which governed his conduct; and—though it might occasionally give him pain, when he knew he was differing in opinion from some of his dearest friends—he never looked to the right or to the left, but went on honestly and straightforward, acting as his conscience told him was right. He had felt greatly annoyed at the division which had been made in the county; though he believed it had made no division amongst his friends in point of kindness towards him; this he would say, he would never do any thing to forfeit their esteem; and high as he felt the honour to be the representative of the southern division of the county, if any one could be found that would represent it more faithfully, he was ready to be put upon the retired list. (*Immense applause.*)

Mr. BENETT then said, that the company had that day been honoured with the presence of a descendant of one of the most eminent agriculturists that England had produced, and who inherited a large portion of his father's talent. His name was well known throughout the country—he meant Mr. Thomas Ellman, of Beddington, in Sussex, whose health he begged to propose, and whose name he was desirous should stand on the book as an Honorary Member.—(*Loud and continued cheering.*)

Mr. ELLMAN returned thanks for the high honour conferred upon him, an honour as unmerited as it was unexpected. He trusted that the meeting would excuse his replying at any length, as he was not so much accustomed to making speeches, as to the pursuits of agriculture. Mr. Ellman remarked upon the difficulty which the judges of stock had to contend with in awarding premiums, especially when the animals were shewn in unequal condition. He would take the liberty to recommend the exhibitors of stock to put the best face upon those animals which they intended to shew, both on account of the credit of the society, as well as their own credit as farmers. If it did not pay to keep stock in good condition, it would not pay to keep them poor, and judges could not well decide upon the quality of the animals, when no flesh was to be found upon the frame; not only was the difficulty of the judges increased, but the chance of the exhibitor thrown away. He would say one word upon the subject of the malt tax, the repeal of which he considered of paramount importance to agriculturists. The tax was unequal, unjust, and impolitic: unequal, because it imposed a tax amounting to 100 per cent., bearing exclusively upon one part of the community; unjust, because it deprived the hard-working man of one of the greatest necessities of life; and impolitic, because it dried up the fountain of our national wealth, namely the exertions of our peasantry. By that abominable tax, the labourer was not only robbed of almost his birthright, but if he was to enjoy a pint of his natural beverage, he must seek it at a beer-shop, instead of having it at his own fire-side, in the presence of that family which he now too often neglected and left in abject misery. The working of the new Poor Laws, as far as he (Mr. E.) had been able to view the operation of the measure, appeared to improve the condition of the agriculturist. One crying mistake which the legislature had made in

carrying the measure into execution, he could not refrain from observing, that was the expense to which the tenantry were subjected too suddenly, in the defraying the expenses of building poor-houses. Either the landlord should bear half the expense, or the time for paying off the debt incurred should be extended. He would now ask leave to propose a toast, which, if permitted, he should do with more than ordinary pleasure: he would give, "Prosperity to the Wilts Agricultural Society." It was to these meetings that we owed all our improvements in agriculture; and not only had we this advantage arising from them, but it brought together landlord and tenant, and produced those good feelings between them, which was a mutual advantage to both. (*Loud applause.*)

"The Mayor and Corporation of Devizes," was the next toast drank.

Mr. THOMAS ESTCOURT said he felt additional pleasure in expressing his acknowledgments for the honour done the Mayor and Corporation on the present occasion, as it was not improbable this was the last time that the gentlemen present belonging to that body would be complimented in their corporate capacity. In whatever capacity they might however be placed, he would take upon himself to say, that they would be always ready, in their respective stations, to promote good feeling and good fellowship among their neighbours. (*Loud applause.*)

"The health of the judges of horned cattle."—Mr. LITTLE returned thanks.

"The health of the judges of sheep."—Mr. ELLMANN returned thanks.

"The health of Mr. Nicholson, the vice-president, and thanks to him for the great and gratuitous services he had rendered the society."—Mr. NICHOLSON was much cheered, and acknowledged the honour in appropriate terms.

Mr. BENETT then passed a high eulogium on Mr. Neate, and Mr. W. R. Brown, the stewards of the society, and proposed their healths, which was drank with three times three.

Mr. NEATE returned thanks, and was willing to receive the compliment paid him (in conjunction with his brother steward) as a proof of the good feeling entertained towards him by his neighbours and friends, among whom it was a great object of his ambition to live on terms of amity and friendship. (*Loud cheers.*) He congratulated the society on the number and fineness of the stock exhibited that day; on the number of visitors to the cattle yard; and, in consequence, on the enhancement of the funds of the society. (*Continued cheers.*)

Mr. BENETT said that the society had been under great obligations to the Treasurers, when it was not quite so prosperous as it then was. He therefore proposed the health of the Messrs. Tylee, whose conduct had always been extremely liberal. (*Drank with great respect.*)

Mr. BENETT next reminded the company that the society had originated with Mr. Saunders and other spirited gentlemen of Market Lavington; he therefore thought the healths of those gentlemen should be drank in a bumper. (*Loud applause.*)—Mr. A. E. Saunders expressed his acknowledgments.

"The successful candidates for the premiums."—Mr. O. CODRINGTON returned thanks.

After some other toasts were drank, a bumper was taken to the next meeting, and the company separated.

The premiums were awarded as follow:—

#### HORNED CATTLE.

FIRST CLASS, No. 1.—To Mr. Richard Stratton, of

Calcott, for the best two year old Bull, a premium of three guineas.

To Mr. Jonathan Grant, of Coulston Farm, for the best Bull of any age, a premium of three guineas.

SECOND CLASS, No. 1.—To Mr. James Beaven, of Thornham, for the best Heifer under four years old, a premium of three guineas.

No. 2.—To W. W. Salmon, Esq., of Devizes, for the best Cow of any age, a premium of three guineas.

THIRD CLASS, No. 1.—To Mr. David Unthank, of Warren Farm, Tottenham Park, for the best pair of Working Oxen, a premium of three guineas; and a premium of five guineas to the same gentleman for the best Fat Ox, (in the fourth class).

To Oliver Codrington, Esq., of Wroughton, for the second best Fat Ox, a premium of three guineas.

To the Marquess of Bath, for the best Fat Cow, a premium of five guineas.

To Mr. James Beaven, of Thornham, for the second best Fat Cow, a premium of two guineas.

FIFTH CLASS.—To Mr. Jonathan Grant of Coulston Farm, for the best Boar Pig, a premium of one guinea.

JUDGES,—Messrs. Thomas Little, James Hull, and James Maton.

#### SHEEP.

A premium of three guineas to Mr. James Maton, of Maddington, for the best two-tooth Ram of the South-down breed.

A premium of three guineas to Mr. William Gulliver, of Collingbourn, for the best four-tooth ditto.

A premium of three guineas to Mr. Stephen Mills, of Elston, for the best Ram of any age.

A premium of three guineas to Mr. W. Gulliver, of Collingbourn, for the best pen of Ewes of the South-down breed.

A premium of two guineas to Mr. Collings, of Devizes, for the best pen of fat Wethers, of the South-down breed.

A premium of two guineas to W. W. Salmon, Esq., of Devizes, for the best pen of fat Wethers of any breed.

A pen of two-tooth Ewes and two Rams, shewn by Mr. Thomas Mills, of Figheldean, as extra stock, were very much admired.

JUDGES—Messrs. Thomas Ellman, David Unthank, and William Church.

#### PREMIUMS FOR REARING LAMBS.

The first premium was awarded to William Pike, shepherd to Mr. John Goodman, of Fyfield, who reared 280 lambs from 268 ewes, 267 of which ewes were living on the first of May last; the second to John Pinchin, shepherd to Mr. Harry Hayward, of Wilsford, who reared 398 lambs from 392 ewes, 391 of which ewes were living on the first of May last; and the third to Joseph Goddard, shepherd to Mr. John Stratton, of Rabson Farm, who reared 407 lambs from 412 ewes, 408 of which ewes were living on the first of May last. The committee, conceiving that very great credit was due to Mr. Hayward's shepherd, recommended that an honorary premium of 10s. be paid to him as a reward for his meritorious conduct.

The following were declared to be entitled to the premiums awarded by the society to female servants in busbandry:—Sally Mullins, servant to J. T. Mayne, Esq., for a period of upwards of twenty years. Ann Eatwell, servant in the family of Mr. Budd, of Winterbourne, for a period of fifty-six years. Ann Parrot, servant to William Wyndham, Esq., for a period of 30 years; and Mary Cook, servant to Mr. John Brown, for a period of 30 years.

The following were the claimants for the great

coats awarded by the society:—Thomas Carpenter, servant to Jos. Neald, Esq.; Thomas Kemp, servant to Lieut.-Gen. Popham; John Richardson, servant to the hon. Sidney Herbert; James Powney, servant to Thomas Poynder, Esq.; William Little, servant to H. Nelson Goddard, Esq.; and John Carter Cove, servant to Sir Edmund Antrobus. There were fourteen other claimants, but the servants of the above gentlemen, not having received a society's coat, they were entitled to take precedence without a ballot.

Mr. Locke, M.P. for Devizes; Gen. Popham; John Neeld, Esq., M.P.; Thomas H. Phipps, Esq.; and the Rev. Mr. Goddard, of Cleeve, were elected vice-presidents of the society. The following gentlemen were elected members:—Mr. Thomas Little, of Biddesden; Mr. Stratton, of Rabson; Mr. Stratton of Calcott; Mr. Atherton, of Calne; Mr. F. A. S. Locke, of Chippenham; and Mr. Wm. Stratton, of Shaw Farm.

The committee recommend that the ploughing match and sheep shearing of the society, for the ensuing year, should be held at Lavington, the third week in June.

## TO THE AGRICULTURISTS OF ESSEX.

TO THE EDITOR.—It is a general opinion that there never was a time in the memory of the oldest inhabitant of this country when misery, embarrassment, and impending ruin, were so diffused amongst the cultivators of the soil, and the trades connected with this employment, as at the present time; and those feelings are progressively increasing, and will at no distant period produce the most lamentable consequences, unless something effectual is done to arrest the deterioration of property which now so generally pervades the farming business.

It is of the utmost importance that measures of relief should be obtained immediately, or hundreds and thousands of families must be overwhelmed in irretrievable ruin.

It is stated in the papers, that two hundred respectable farmers of the Cambridgeshire and Isle of Ely Association waited upon the Duke of Wellington, at the late installation, to deliver an address, representing the distressed state of the farming interest, in which they relate "whilst we thus avail ourselves of the opportunity afforded us of paying our unanimous respects to your Grace, we hope we may be permitted to allude, for a moment, to our condition as farmers. The whole of our rents, tithes, and taxes are paid out of our fast diminishing capitals, instead of out of the profits which such capitals, and our own industry, ought to return." I apprehend this is a true description of the state of the farming business, not only in Cambridgeshire, but generally through the country.

It is a most appalling state of things, and demands an immediate searching enquiry of both Houses of Parliament into the causes of distress, and the remedies for them; both of which I confidently anticipate are within our reach.

I have seen many writings on political economy, and I have heard many speculative opinions on the present alarming state of the country; but I have neither read nor heard any thing satisfactory on the subject, till a letter was put into my hands, addressed to the President and members of the Chelmsford Agricultural Society by Lord Western.

This is an inquiry particularly fitted to his enlightened mind. I know of no member of either Houses of Parliament so qualified to enter upon such

an investigation. He is a legislator of long tried experience, of sound judgement, and he has had an opportunity of watching and tracing cause and effect, and, he has been during many years intimately acquainted with all agricultural subjects. In the time of the late Mr. Pitt, no member of the House of Commons obtained more respectful attention from that great statesman than this intelligent legislator, therefore Lord Western must be considered high authority; and, he tells you the most cheering news—that golden days may be again restored to you, and that happiness and comfort may even now supersede embarrassment and distress. Lord Western appears to me to have made out a strong case; his facts, his illustrations, and his arguments I regard as unanswerable. He tells you that the cause of your distress is the Currency Bill of 1819. When that measure was discussed in the House, it was admitted on all hands that it would make a great change in our relative situation; and it now appears that change will be as Sir Robert Peel's father predicted!—a most fatal change to thousands, unless by retracing our steps measures of relief are obtained.

Therefore, Farmers arouse yourselves: let every parish immediately petition both Houses of Parliament; beseech them to consider the opinions and suggestions of Lord Western, and thus be the means of saving you and your families; it must be now, or never; your case will not admit of delay; you must demand redress of your grievances, for they are too deep and sorrowful to admit of postponement—they can be no longer sustained. Give your petition to those who can advocate your cause; let them tell the Houses of Parliament that delay to you is ruin.

Lord Western tells you, and I believe truly, that redress is easily attainable, that our monetary system may be adapted to the condition of the country without injury to any class of the people, that is to say, upon the balance of advantage and disadvantage, and he states he is sanguine enough to believe that if such was effected, the brightest scene of prosperity would open to us, even yet, that was ever enjoyed by any country in the world. AMICUS.

CAUTION TO FARMERS. — On Thursday last, Mr. Amphlett, of Dunclent, applied to the county magistrates sitting at Kidderminster, to grant summonses against some nailors of the Lye Waste, under the following circumstances. He had engaged them to reap his crops of wheat, and given them four shillings as earnest money; they now refused to complete the bargain. The magistrates decided that Mr. Amphlett should have had a *written* agreement with the men, and not having this, they could not issue the summonses.

The manner in which corn is preserved in Morocco is deserving of mention. A subterranean cellar is dug seven or eight feet in depth, the sides of which are covered with reeds and straw, the bottom part being matted, and straw placed over it. The grain is then deposited, and well protected at top by straw being placed over it: the opening is covered by a large slab, over which the earth is heaped in a mound, to prevent the rain settling and entering. In these kind of granaries, or *matamors*, as they are called, and which are usually made on sloping ground, to secure them from damp, wheat and barley, I was informed, would keep perfectly good for five years, and other grain to a longer period. The largest *matamors* are at Rabat, and are capable of containing some hundred bushels.—Spain, by Sir Arthur de Capell Brooke.

## TRIFOLIUM INCARNATUM.

TO THE EDITOR OF THE CAMBRIAN.

Sir,—In the months of August and September of last year, I sold a great quantity of seed of the New Scarlet Trefoil, or *Trifolium Incarnatum*, to the gentlemen and farmers in this and the adjoining counties, which I am sorry to find in many places partially, and in some places, altogether failed. Feeling anxious to find out the cause of failure, and to ascertain the best method of cultivation, in order to give the agriculturists of this country correct information, I wrote to three seed merchants in London, with whom I do business, requesting them to get all the practical information they could from growers in Essex, Kent, and other parts, where it has been successfully cultivated to some extent for the last two or three years.

Their travellers, in their different circuits, have kindly attended to my request, to which they have added their own observations, and write to me as follows :—

The *Trifolium Incarnatum* has done better this year than ever. The general plan has been to sow on the stubble, and harrow it in without ploughing; this plan has succeeded better than fallowing, as the root seems to require solidity of soil. In several places where the land has been fallowed, the plant has died away two or three weeks after its appearance: in this case, where the roller has been applied, it has been successful in saving the crop. As an instance, one farmer had fallowed 18 acres, and sowed the latter end of August; in three or four weeks after the plant appeared, he perceived it going off in various parts of the field; he took a heavy roller, and put on as much weight as three horses could well draw about, and from that day it improved; the result was, that in May he cut two tons and a half of prime hay per chain acre, and in four or five weeks after had another heavy crop. My informants also add, that the *Trifolium* supersedes the vetch in every respect; in the first place there is no expense in cultivating the land, where there is a clean stubble; in the second place, it produces more than double the quantity of fodder; another advantage is, that it makes as good hay as our common clover, and as green fodder is much better proof, being more solid and much more nutritious.

The *Trifolium* should be sown in August and September; 14 to 16lbs of seed is the proper quantity per acre.

By giving the above remarks a place in your widely circulated paper, you will oblige, Sir, your obedient servant, JAMES SAUNDERS.

Abergavenny, Aug. 13, 1835.

## AGRICULTURAL REPORTS.

## NORTH OF STAFFORDSHIRE.

We are now in the midst of our corn harvest, and almost every field appears loaded with an abundant crop, both of corn and straw. We had also heavy crops of meadow grass, and all got secured in excellent order. The clover crops were rather deficient, but so little of that useful herbage is sown in this country that the failure is of little consequence. Our southern neighbours are sadly short of pasture grass, and certain patches with us are also quite burnt up; we have not had such a dry season since the year 1826, but the crops are nearly double to what they were last year. Should the dry weather continue beans will be a deficient crop. The potatoe crops look well. Nevertheless, with heavy crops, and with

rents much lowered, the farmers have a hard struggle to keep their heads above water. What with the best of wheat selling at less than a penny per pound, and potatoes selling at six pounds for a penny, we are naturally led to say that wheat is cheap enough to give to the pigs, but then the best fed pig is worth no more than 3d per lb, and the finest dry hams and bacon will not fetch more in the market than 5d per lb wholesale.

Cheesemaking, (which is the staple farm produce of this country), began very promisingly, but has fallen off lately from two to one per day, and farmers think they will only have about three-fourths of an average weight; they look anxiously to an advance of price: 5d per lb is the best price at present.

Wool has been sold pretty well; 1s 6d per lb has been got for such wool as last year brought 1s 9d per lb, still no grumbling; 1s 6d is a fair price.

Butchers' meat is at all prices—from 3d to 6d per lb, according to quality, but the offal causes great grumbling amongst the butchers; but though skins, hides, and tallow, are very low, still some how or other boots and shoes are like penny pies, always of a price, viz:—10s for shoes, and 30s for boots. Jockey boots are now out of fashion, else their price is 2 guineas per pair.

Farming here is at a very low ebb, tenants have long ceased to improve land in the usual way, they are taking what God sends without cultivation or improvement, and many landlords begin to neglect their estates and home-farms,—they seem no longer anxious of showing their tenants a pattern of good farming, with the improved implements or systems of the art,—all they seem to want is to get a rent of some shape, and they let their lands not to the most experienced tenant, but to the most monied man, who is not likely to go to gaol for a year or two; it is all over with the British agriculturists, there is no more sending to Northumberland, or Norfolk, or Scotland for farm bailiffs; the ancient deer-parks are let to such as can re-let them to the public asleys for cattle, or stock them with calves, or stirks, or heifers, or cows, or colts, or bulls, or any other animal that will bring in a shilling or two per week. As a proof of agricultural depression it may only be observed, that the writer of this, who has had perhaps more practical experience in the cultivation and improvement of lands than ever fell to the share of any one man, and after forty years service he is at this time, for the first time in his life, in want of a situation, not from any fault or blunder on his part, for his character would ensure him in any situation, but there are actually no situations to be got, and though he has applied to some scores of what he called friends in various parts of the kingdom to look out for him, he has never been offered any thing better than a head ploughman's place, with a shilling more per week than a common labourer, or one shilling less than a bricklayer's labourer. This, you will observe, must be very heart-breaking to a man who for the last 21 years has been as farm-bailiff, at the head of a large establishment, with every thing under his care from the ice-house to the hot-house; but his character, his experience, his attainments, his inventions, (including the gate shutter hinge), must now be wholly lost to himself and to the public; he must now in the decline of his strength endeavour to earn his bread by main strength, as he never was cunning enough "to turn the penny" at buying and selling, and farm produce can only be turned over once in the twelve months. The only shift that he can make is to rent a few fields, and with his own hands to milk his few cows night and morning, till Providence places him either in a better or worse situa-

tion. A small farm would do him no good, and he has not capital sufficient to stock a large one. No farm will pay when it is so small as not to support something like a farming establishment; on a small farm nothing can be done to advantage, something is for ever wrong, strength is wanted, implements are wanted, and the little farmer loses half his time in begging, borrowing, or returning the articles borrowed, and he is obligated to sell his produce at a disadvantage in order to meet his payments; and, should he by the best of luck work out his own salvation from a gaol, he must wear out his own constitution during the time with fear and trembling.—August 18.

#### SUFFOLK.

Harvest work is proceeding rapidly, aided by weather the most favourable we have experienced for many years; we have not had sufficient rain in this county since our last report even to lay the dust; many farmers have already secured all their wheat in most excellent condition, and in all probability the wheat harvest will be completed by Saturday, before this report is published. Peas also are secured in fine condition, and as "hard as shot." Barley harvest is now generally commenced; we have observed several pieces carted, and should the present unusually fine dry weather continue for another ten days, the barleys will also be secured in uncommon fine condition; in fact, the harvest will be entirely finished (with the exception of beans,) and every species of grain in the finest condition possible.

It may be expected we should give some account of the probable or expected produce of the different crops. If we were to form our opinion from the bulk of straw we should say they are superabundant, but as practical farmers we would not deceive ourselves or others by such frail calculations; nothing but good crops, that is, full average crops, will avail the English farmer, and such we feel thankful to the Bountiful Disposer of all good is our happiness to report for this county. The wheats are not such a fine even sample as last year, from being lodged so early (when they were in blossom); many ears produce only a shrivelled, flourless grain, and upon close examination, we find more or less shrivelled kernels in fine ears, therefore, a portion of the kernels being injured, the produce will by that means be lessened. The barleys which are not lodged are particularly fine and bright; we see no reason to suppose but they will be a fair average crop. Oats also are a heavy crop. Peas are particularly well podded, but the intense dry weather has made the peas rather small in size; they are generally a very handsome sample. The quantity of winter vetches saved for seed is more than usual, and well loaded with pods. The second crops of clover are very short, scarcely sufficient to stand against the scythe. The turnips, which at the time of our last report were very promising, are now at a complete stand, and the late sown ones, which escaped the ravages of the fly, are perishing for want of rain. Mangel wurzel stands the drought somewhat better, and where an early plant was obtained, is looking well beyond expectation.

The poor law commissioners are extending their labours gradually from hundred to hundred throughout this county. We believe the general feelings of the rate payers, before they commence putting in operation the new arrangements, are greatly prejudiced against them; but we are happy to state we cannot learn a case but that that feeling has subsided on the rate payers and commissioners being brought in contact, and that decided majorities, if not the

entire meeting, have fully acquiesced in their propositions. It further affords us gratification to find they are fully persuaded they shall be able to reduce the present amount of poor rate from one-half to two-thirds; principally by finding employ for the surplus labourers in some distant county (Lancashire), where they (the commissioners) guarantee to find a comfortable house and constant employ, and from 12s to 15s per week for each labourer, for three years, the parish to which such labourer belongs paying the conveyance there. We are sorry to state nearly every parish in this county will have its share of surplus labour, and there is no other prospect at present but that it will greatly increase in consequence of the depressed and still declining price of all agricultural produce; not that we infer there is a surplus of labourers in every parish, but that the low price of agricultural produce will not enable one-fourth of the occupiers to employ half the labour they actually want.—Aug. 14.

#### NORTH RIDING.

We have had three weeks of very droughty weather, occasionally very hot. Showers have certainly fallen in some places, but not general rain, on which account our pastures and seed lands are very bad; seeds in particular are quite brown and burnt up, and in many places a run of water would be found very useful. I am afraid many will be obliged to sell their feeding stock to disadvantage, particularly beasts. Sheep stand the weather much better. I have my store ewes in a seed field, which appears quite bare, and there is not a drop of water in the field, yet they are in good condition. Turnips are looking much better than I expected; they want rain very much; the fly has not been so troublesome this year. I took a ride round our neighbourhood the other day to examine the crops. I find wheat to be more an equal crop on the good and bad soils than it generally is, and likely to be ripe more together; the dry favourable spring has been in favour of the cold wet sows, but some high winds we had some time back, and the long drought, I believe, has injured it very much; on close inspection there appears great numbers of stems down, and good for nothing; many of those standing appear to ripen prematurely, and by feeling at the ears they do not appear so full as one might expect. I think it is short of an average crop, and do not believe the sample will be equal to last year, either in appearance or weight. There is a great quantity of old wheat on hand yet, more than I ever recollect to have seen.

Barley is not heavy; on some of the best barley land the crop is much below an average one; on inferior soils it is rather better. Oats about the same, but I do not think there are so many grown as there were some years back. Beans only middling, they appear to want rain. This account is given to the best of my judgment, without interest, as I have no old wheat to sell.

I was thinking so much about harvest that I find I have forgot hay time, which has been a very favourable one; the crop of grass not heavy; but as for fog or aftermath we have none; never saw them look worse in my life. Our markets go like the barometer, but contrarywise; when there is appearance of rain they rise; if like fine weather, down they come again; at present they are rather changeable, but rather denoting fair weather; it is very good wheat that is worth 6s per bushel. I forgot to state in its proper place that on some of the forwardest soils harvest has commenced, but only a few fields; next week if the weather continues as at present it will be more general; we are cutting it much longer be-

fore being ripe than formerly, and I believe there are many advantages in so doing; there is not that hurry, or danger of winds as when it is allowed to get quite ripe. Price of reaping from 7s to 8s 6d per acre. Our cattle markets are rather on the decline.

I cannot close this report without expressing my great regret at the treatment which the agricultural interest meets with in parliament. What can they be thinking of? Why, now for instance, they are for cheap bread. Well! Mr. Lawson proposes (like a sensible man) that draining tiles should be exempt from tolls. Mind, he did not bring in a bill, to compel landlords to give their tenants draining tiles. No such thing. He only proposed that the tenants should not have to pay toll for them. And what do they do? Why, cause him to withdraw the motion, or it was lost, or something else; however, I heartily thank Mr. Lawson for bringing it forward. In my humble opinion, that simple measure would have done more real service to the country, than all the work they have done this session put together.

Knaresborough, Aug. 12.

J. N.

#### NORTHAMPTON.

The wheat of this county has been secured in excellent condition. On the warm land, the bulk of straw is unusually large, but there cannot be a doubt that the grain will prove of inferior quality, and the quantity not a full average one. From the generality of the crops having been so long layered, and the weather so hot and dry, the grain became dried up, and thus prematurely ripened. The clay land has produced less straw, and the weather suiting the soil, the wheat produced on it will be found to be of very good quality, and the quantity a full average. The barley, which is chiefly carted, is a full average crop, and of excellent quality. Oats and beans full crops, of good quality.

The crop of Swedish turnips cannot prove an abundant one; it is only here and there that a good crop is seen, for many after having escaped the ravages of the turnip fly, have been much eaten under ground by the wire worm or grubs, and many late sowings have not come up. The common turnips, although now much dried up, may, with timely showers, yet become good fair crops.

The good grazing land of this county is very much dried up; but where the pastures are well supplied with water, the cattle hitherto have continued in a thriving state. Although the bite of grass is very short, it is nutritious; this sort of roast meat, suiting cattle better than the long washy grass of a wet season. Flocks of sheep are seen on such closely bitten clover leys as to induce the supposition that the sheep must be nearly starved. Nevertheless, they are not doing amiss as store sheep.

The crops of hay have been remarkably abundant, but in few seasons have so many ricks taken fire, or been seriously heated as to be rendered of little value. No doubt more caution will be exercised in future years, but in this county less trouble has certainly been bestowed upon hay-making than it was once customary to give. Hay, no doubt, needs more making in some seasons than in others, and the grass produced on some lands requires to be longer exposed to the sun and air than that which is produced on a different soil. The writer of this report has a small meadow, the produce of which he can, in fine weather, safely carry the day after it has been mowed, but this can never be done without great risk with the pro-

duce of the rich meadows on the banks of the Nen, nor, in fact, of any rich grass land. The grass this season was of very quick growth; being therefore so young, and so full of sap, it necessarily wanted more making than usual. This season appears to make good the assertion, that there is as much hay spoiled in fine weather as in bad.—Aug. 22.

#### HARLESTON.

As the harvest in this district is now nearly completed, it may not be uninteresting to know the result of the best information obtained on the subject. The opinion expressed, when the wheats were so universally laid by the heavy rains in June, that with fine weather afterwards, the crop would be found not to have received the injury anticipated by many people, will, we think, be proved to have been correct. The quantity of straw is greater than it has been for several years, and the corn, both in quantity and quality, is a full average crop, although in the former not equal to last season. It is all secured in the finest possible condition, and judging from the present deliveries, the best samples where the straw was not lodged, will prove equal in weight to those of last year; but smut is, we think, more prevalent.

Of barley about two-thirds is carted. This crop is also very bulky in straw, and in yield will be found, if not a full average, at least much superior to last year. The quality will be of every variety, but the greater part, from its premature ripening, thin and steely. Some are very coarse, and others of fine colour. The Chevalier will again be the best, and having now proved its superiority in different seasons, it will, we think, in future be almost universally grown.

Our breadth of Oats, although perhaps greater than usual, is still very limited: they have stood the drought better than anything, and the samples are very handsome. There are no complaints of the yield by those who have thrashed.

That most uncertain of all crops, the peas, are this year considerably above an average, but they will be wanted to make up the deficiency in beans. The rains in June came too late to save the latter. They will be very dry and heavy, but the produce must be short.

We have a larger quantity than usual of old wheat in hand, which will successfully compete with the new, and prevent any improvement in the price of the latter, low as it is setting in, say for good dry red from 36s to 38s, and white 38s to 40s per qr. The best fresh thrashed old will not fetch above 1s to 2s per qr more.

We have had an excellent crop of hay, all well got up; and the second crops of clover, having little or no seed in them, will be principally mown immediately after harvest, and add to the quantity; but the turnip crop, on which so much depends in this county, is a total failure. A few weeks since nothing could be more promising, but the Swedes have been either killed by the severe drought or destroyed by the grub, and the white turnips within the last week have been completely taken off by a species of caterpillar, called provincially the "Black Jack," whose ravages have not been experienced for nearly forty years. As many as from sixty to one hundred may be found on a single plant, and they take off fields of eight or ten acres in half as many days.—Aug. 22.

#### OXFORDSHIRE.

We have experienced remarkably dry weather for several weeks past; even the nights have frequently

been so free from dew that carrying might have been continued from eve to morn without injury to sheaf corn. Teams have been in the field before three o'clock, carting wheat in some places, in others the labourers might have been heard as late as ten at night. The quantity of wheat carted, within a period of 8 days, is probably without parallel. A considerable quantity of barley has been housed in most capital order. The demand for labourers has been great, the wheats having ripened off on a sudden, and a loss has been sustained where a sufficient number of hands were not engaged in due time. The reaping has proved more tedious and more expensive than we ever remember, (amounting to upwards of 20s per acre). The wheat in this county may be said to be all secured, but a large portion of barley and oats are yet standing. Peas have been stacked in good condition, and will yield a good product, and of fine quality. Beans are become so ripe, and shed so freely, that they can only be cut without great loss in the early part of the day, the men being put to other employ the after part. The quality, (if well harvested), will prove excellent. Chevalier barley (a large proportion of which is grown this season) is a beautiful colour, but not so plump as last year. The wheat is so bulky that the number of ricks is quite unprecedented, and the yield to the acre we apprehend will be good, and the sample (as far as we have observed) is better than we could have anticipated, considering how much it was laid. It will however come very slowly out of the straw, and thrashing it so as to clean the straw appeared to be almost impracticable. The barley crop was never remembered better, and but rarely, if ever, so good (reckoning both quantity and quality.) Oats are a good crop, but on thin land have been too much dried in the grain for them to produce a heavy sample. The great heat and bulk of work to be got through has caused an immense consumption of beer, consequently will require a corresponding proportion of malt to replenish the farmer's cellars, and yet the price demanded for new barley is less than one might have supposed, when we consider the quantity of malt that will soon be required, and the low stock remaining in the maker's hands.

The pastures are so dried up that keeping is become very scarce. The barometer has for several days indicated a change, and this morning we have had several showers so as to put a stop to carrying. Our markets are become very flat; perhaps rain in a sufficient quantity to set the plough going and drive the mills, may infuse a little more life into the market.

#### GLAMORGANSHIRE.

The weather continues warm and highly favourable for the harvest. The thermometer rises in the shade frequently above 80 deg., and on the 11th it rose to 84 deg. More than half the wheat crop is now secured in the vale of this county, and generally in good order. In the last week some rain fell, and although it was light, yet it rendered the corn unfit to be stacked for two or three days; but the impatience of many would not allow them to wait, and a large portion was put together in a damp state, and in some instances this has again been spread about to prevent heating. We observe that the damage in the rick-yard is much greater every year than is experienced on the field, by unavoidable causes. The wheat crop proves to be an average one in bulk, and the grain is good, but the yield will be deficient on those pieces which were lodged early in the season. The barley is rather light, especially on thin soils, from want of moisture, and it will not be equal to

last year. The summer has been very dry throughout, and the quantity of rain fallen in the last two months extremely small, not half the amount as in the corresponding months of last year. Grass is short, and the pastures are burnt up, having lost their verdant hue. The turnips will be a light crop. The mangel roots penetrating deeper into the ground than the turnip, stands the drought better. At the commencement of harvest reapers were expected to be scarce, and higher wages were demanded, which in some cases was submitted to, but an ample supply arrived from the adjoining counties. The average price paid is 9s and 10s per acre, or 6s per acre and diet for reaping, binding and Stooking. Reaping in this county had long been a disgrace to it, on account of the practice of leazing immediately after the reaper. In some parishes the latter claimed it as his property, and let it out at so much per acre without any reference to the farmer; but this absurd practice has been nearly abolished, by some of the principal occupiers in the vale procuring strangers for cutting their corn.

The markets remain dull for all agricultural produce. Ewe and lamb wool has been selling at 29s per stone of 21lbs; tegg wool is worth 3d per lb more, but there is no great quantity of the latter in this county. A few weeks ago there was some appearance of rough weather for the harvest, which had an immediate effect on the price of old corn, but the recent fine weather has brought down the price to from 5s to 5s 6d per bushel. History does not furnish us with so long a succession of fine seasons in our climate as has been experienced lately. Formerly a wet harvest was calculated upon in the course of six or eight years. The present generation have had three, namely—1799, 1816, and 1821, in each of which a large portion of the crop was destroyed, and the old stock became invaluable; but since the latter date, now fourteen years ago, the damage in any season has not been of any consequence. The holders of old corn having been sufferers so long will cease to continue it, and when a wet harvest does arrive, we expect it will find the country without any old stock. The government should take out of the market a portion of the surplus at the present low price. It would afford immediate relief to the grower; and may, in all probability, prove equally beneficial to the consumer at no distant period, and yield a good profit on the transaction.—Aug. 15.

#### MONTROSE.

Since the 7th inst the weather here has been fine, but on that day we had a tremendous storm such as we never remember experiencing at this season, which has done a great deal of injury to the crops, by breaking down, twisting, and loosening at the roots. We did not think the injury was to such a great extent until Saturday, when one of us had a long ride through the country and found so much premature ripening, particularly on light soils where it was much loosened at the roots in many places, but the most exposed seemed quite ready to cut and not half filled. We shall have a great deal of light grain this season in consequence of the storm, and also a great deficiency in quantity to what there would otherwise have been. It did not extend far south, but to the north we learn it was even more violent than here. Beans and potatoes are also much injured; in many places they are almost black. We shall have partial cutting in the early districts this week, but it will be two or three weeks yet before we shall have general harvest.—August 15.

## AGRICULTURAL INTELLIGENCE, FAIRS, &c.

At ASHBURTON FAIR, the show of bullocks was not large, and the business done was at about late quotations. There was a large supply of sheep; but things in this way were very dull, and quotations at about 4½d per lb. Wool was selling at 10d per lb.

At MARK FAIR, there was a good show both of lean and fat cattle, which met with rather a ready sale. Few horses of any description were exhibited, and although offered for sale at low prices were quite a drag.

CARMARTHEN FAIR.—There was a considerable display of horses and cattle; the former sold at fair average prices, and the latter, we regret to say, went off at low prices. Ponies and colts obtained improved prices. On the following day a fair for pigs was held, but there was little or no demand for them.

HORNCASTLE GREAT HORSE FAIR.—Wednesday, August 19.—We have had a greater show of horses this year than usual, and almost every thing above the common grade of hacks has been sold. Several dealers attended from Germany, France, and Prussia, who have purchased extensively in carriage-horses and hunters. Among the principal English dealers were Messrs. Ellmore, Dickinson, Anderson, Cattle, Western, Wimbush, and Shackle. The Messrs. Ellmore purchased five beautiful greys of Lord Wharnclyffe, for 800 guineas. Several horses have fetched from 100 to 250 guineas each. It is by many persons regretted that the town authorities do not put a stop to the business carried on in the fair on Sunday; it is calculated that not less than between 200 and 300 horses have been sold on that day; and even during the performance of divine service both morning and afternoon, horses were shown and trotted up and down the principal streets.

STOWMARKET LAMB FAIR was very fully attended, and the number shown was large, but in consequence of the continued drought, although they were offered at very reduced prices, little business was done. The general currency was from 14s to 21s. The show of neat stock was good, but there was no briskness in the trade. The fair seems to be upon the increase, both as respects the attendance of company and the quantity of stock.

ASHBORNE FAIR was well supplied with cattle and sheep; there was also a good show of lambs, but in consequence of the dry weather and the consequent scarcity of food, business was anything but brisk. Beef and mutton averaged about 5d per lb. In the horse fair there was nothing that calls for remark—prices were low and business flat.

WARWICK FAIR.—At our fair, there was a good supply of fat and store stock, but the sale was not brisk. The prices were—for beef and mutton, 5d to 5½d, and lamb, from 7d to 7½d. Store and milch cows were much depressed in price.

At THETFORD FAIR on Monday last there were from 10 to 12,000 sheep and lambs penned, which met a slow sale at the following prices:—Lambs from 18s to 22s; shearlings, 28s to 32s; and crones, 14s to 16s per head.

ROMNEY FAIR.—The annual Stock Fair was held at New Romney on Friday Aug. 21. The ordinary provided at the New Inn, was laid out in the National School Room. T. Hallows, Esq in the chair. The chairman, on giving 'prosperity to agriculture,' noticed the fatal consequence of the long drought to the occupiers of land in the Marsh, and expressed his hope that landlords would consider the losses of their tenants, on receiving their rents. He then announced the number of sheep and lambs penned on this occasion to be 17,304—out of which there were sold only 709. The average prices were, lambs, 15s 6½d; old ewes, 14s to 19s; tags, 23s to 26s. The number penned was 5,000 more than on any former occasion, which the chairman

accounted for by the want of keep occasioned by the long drought. To the same cause may be attributed the small number sold, and the low prices obtained.

At KNIGHTON FAIR, the stock of horned beasts brought for sale was not so large as we have seen in former years, therefore the business done was little; but in sheep and pigs the market might be said to be brisk, and much money exchanged hands, at from 5d to 5½d per lb for mutton. The number of sheep penned far exceeded all expectation, and had it not been for the extreme dryness of the season, the whole would have been disposed of.

PAISLEY, ST. JAMES' FAIR.—The number of horses in the market was not so great as we have seen, and the business done was inconsiderable. There was a good show of milch cows however, and prices ran rather higher than for some time past. The average rates of those in the market were from about 9l to 14l. Highland cattle for marts ran from 3l to 6l, according to size and condition, but most of those in the market were in a very poor state.

LOCKERBIE LAMB FAIR.—This market agreeably to the regulations regarding it, was held on Wednesday week. The number of lambs on the hill at 12 o'clock was about 40,000, exclusive of a few lots that had been driven off early. Of these about 20,000 were pure Cheviot; 10,000 cross Cheviot and Leicester; 5,000 black-faced; and from 4 to 5,000 cross black-faced and Leicester. Selling became general about 11 o'clock—although up to three it might be called a heavy market; yet the sale of a great number of the principal lots of each of the three first mentioned kinds had then taken place. It may be stated generally that the rates of the medium half-bred Cheviot and Leicester lambs were from 13s 6d to 15s 6d, some superior lots reaching 16s, and one very superior lot reached 18s 6d. These rates were from 2s 6d to 3s under last year's general prices. The cross black-faced and Leicester might be from 11s to 13s. One or two of the very best lots of Cheviot lambs reached 12s to 12s 6d, but the price of fair medium lambs would be from 9s to 10s. Cheviot ewe lambs, from the best stocks, were in request, one lot only reached 11s. From 8s 6d to 9s might be an average. Cheviots on the whole, were from 1s 6d to 2s a-head lower than last year. From one-third to one-half of this fall may be accounted for from the inferiority of the lambs compared with those of last year. The sale in the afternoon was considerably quicker than in the forenoon; and by 5 o'clock with the exception of black-faced lambs, few lots remained unsold. The demand from Cumberland, indeed from the north of England generally, was good. The black-faced lambs were not much in demand. One lot of mid-ewe lambs sold for 9s, and two or three lots of wethers reached 7s or 7s 6d, but many lots remained unsold. It seemed generally understood that the prices given for this description of stock at the recent market at Lanark were scarcely maintained. Many wool staplers were present, and wool sold readily from 18s to 19s per 24lbs.

At MELROSE FAIR, the number of lambs brought forward was estimated at 60,000. The market opened heavily, but quickened in the after part of the day. Cheviot ewe and half-bred lambs, were most in demand while for Cheviot wether and full-bred lambs, of which only a few lots were exposed, the sale was dull. The prices were for bred lambs, 18s; half-bred 12s to 17s, and a few very fine lots sold as high as 18s. Cheviots brought from 5s to 10s, according to quality, being a decline of 1s 6d to 2s per head on the prices of last year. The demand for old sheep, a few of which were exhibited in the market, was exceedingly dull; and in the cattle market very little business was done.

At STIRLING LAMMAS FAIR, about the usual number of black cattle were shown. Fat sold readily at from 6s to 6s 6d per stone; other descriptions were dull sale, and from 15s to 17s a-head lower. Good milk cows were from 7l to 9l, queys, from 6l to 7l, and a number were unsold. There was no business done in

the horse market worth reporting. The price of hay is usually fixed at this fair, but to-day it has ended in a sort of hold-and-draw way betwixt the farmer and consumer, the former refusing to part with it under 60s to 62s a ton, while the latter is only offering 52s 6d to 55s. The price will probably be in the middle.

**AT MINNIEHIVE NEW LAMB FAIR** there was produced for sale nearly 6000 lambs of the Leicester and Cheviot breed, which sold at from 13s to 19s a head; there was likewise exhibited a considerable number of black-faced and Leicester lambs, and these sold from 10s to 12s. Before three o'clock p.m. nearly the whole had changed hands, at fair remunerating prices to the breeder. Mr. Moffat, Gleucorse, sold 64 scores of well bred lambs, and 70 head of bullocks.

**FALKIRK TRYST.**—We may enumerate a few of the purchases that were made, on the first and second days, of lean or driving stock:—Some lots from Skye, two years old, from 2l to 4l 10s per head; ditto three years old, 4l to 5l per do; from Hlsay, 110 two years old, from 4l to 5l per do; from Argyll, 50 two year-old stots, at 4l 4s per do; from Lewes, 100 two year-old stots, at 3l per do; Angus and Fife runts, from 7l to 10l per do; country heifers, three years old, from 4l 10s to 6l 10s per do. From the above statement, it will appear that the prices of black cattle must have fallen, upon the gross, full 15 per cent since this market of last year. Yet it may not be unworthy of remark, that at this market, the young and small cattle sold about 7 per cent higher than the heavier kinds in comparative value, of which a number remained unsold. These being generally the first, when our usual English dealers were in the market. Of the horse market little can truly be said. Although the show was large, yet few horses worthy of high prices were observed and a general dullness and want of animation was observable throughout the whole of the tryst.

**THE DROUGHT.**—The protracted drought begins to excite considerable alarm among the farmers in the environs of Brussels and the canton of Arche. The fields are scorched and burnt by the sun, water is scarce, the wells and springs are dried up and exhausted; the water in the ponds is spoiled and so bad that the cattle will not drink it. The fruits on the trees are withering for want of moisture—forage is becoming scarce, as well as culinary vegetables—the hops, which constitute the chief resource of the little farmers in some districts, will hardly produce anything this year. Last year 100 perches of hop gardens produced 110lbs of hops; this year the produce will be 25 lbs at the most. It is a remarkable fact that there are no wasps, which in other years did so much damage to the fruit, and were a great annoyance even to the horses.—*Brussels Paper.*

**THE HARVEST.**—The wheat harvest is almost completed in this county, and finer weather, from the commencement to the close, has not occurred in any former year within the memory of the oldest agriculturist; consequently the wheat has been housed in fine condition, and the crop is excellent in quality, and where not materially injured and laid by the heavy rains and winds at the end of June and beginning of July, the produce will be sufficiently abundant. Peas are every where an ample crop, yielding in many places a large produce per acre; but those of the very early description are much inferior to the later ones. Beans have proved, in many places, little better than half a crop; there is little doubt but they will rise in price soon, as last year was unfavourable to them. The hops in this county will not average more than one-third of a crop; yet a few choice yards are to be found in Orleton, near Leominster, Marden, and Wellington, almost equal to any in Kent. The produce of fruit is very irregular, but taking it altogether, there is a fair "hit." In some orchards the trees are loaded to such a degree that their branches touch the ground; while in others there is scarcely an apple to be seen. Owing to the continued dry and warm weather the apples will be small, but the cider, if not so great in quantity, will probably be of first-rate quality.—*Hereford Journal.*

At OSWESTRY FAIR, store cattle were very dull sale. Sheep barely supported former quotations.

**KENT.**—In consequence of the prevailing drought in the neighbourhood of Canterbury, the want of water is severely felt by the inhabitants. Waggon and carts, from the country, containing butts and tubs, may be seen daily employed in the conveyance of this essential article. The most remarkable fact is, that many wells in the immediate neighbourhood of the Stour refuse their wonted supply; and it is no unfrequent occurrence to suspend the working of the machinery of the Abbots' mill, owing to the failure of the springs. The most serious consequences will ensue, unless a copious supply of rain, which has not been experienced for many months, should cause them again to rise to their usual height. The beautiful stream at Bridge, which intersects the Bifrons estate, remains dry; the channel presents the appearance of a newly-cut road. All the fish in the preserve of the Marchioness of Conyngham died some weeks ago.

**EAST LOTHIAN.**—Some patches of barley were cut in this vicinity the end of last week, and on several early farms the shearing both of it and wheat, has this week become pretty general, considerably more than one hundred hands being employed on one extensive possession. As several of the wheat fields are much broke down and twisted by the frequent high winds, the use of the scythe hook is found peculiarly unsuitable; it will, therefore, be highly advantageous to operate with the teetled sickle, which is calculated to make better work. Now, from the partiality which labourers have for the former implement, it is often difficult to induce them to use the latter, but when hands are so abundant as at present few or no objections are made.

The harvest is getting on as fast as possible about Spalding, but there is a general complaint of want of hands. Farmers are giving 20s per acre.

In the NORTH OF DEVON the harvest is pretty well got through with. The crops of wheat, barley, and oats, are every where spoken of as abundant, and so superior as to excite the admiration of all farmers and agriculturists.

**HARVEST.**—In all early and sheltered spots, harvest will be general in a few days. On Thursday last, we observed stooks on the Corbelly hill, behind the Observatory, and have since learnt that Mr. Hutchinson commenced cutting about the same period. But Tinwald is so early and kindly a parish that we presume before the lapse of many days, all hands will be at work on its slopes and plains. Mr. Brown, miller, New Bridge, ended his barley harvest on the 14th inst., and we doubt not there are others similarly situated whose names we have no opportunity of recording.—*Dumfries Courier.*

The great heat of the weather, and long continued drought, has brought on harvest much more rapidly than was at one time anticipated, and, in many cases, too fast for the benefit of the grain. On Friday and Saturday week reaping commenced on several extensive farms on Tweedside, and on others within these few days, and should the weather continue dry, there will not be much interruption in the labours of cutting. There is found on reaping a great diversity in the bulk and quality of the crops. Some oats on light land have been cut with the scythe, being too short for the reaping hook, whilst on heavy and retentive soils, the long and almost unprecedented drought has not done so much injury as was feared. The pastures are literally burnt up, and it is a remarkable fact, that, in many places in Berwickshire, it has been found necessary to supply stock on pastures land with hay. In consequence of the drought the crops in the upper part of the county are ripening very fast, and harvest has already commenced on several farms.—*Kelso Mail.*

In a few instances, in the Upper and Middle Wards of Lanarkshire, the reaping of wheat and barley has commenced. In particular a field of wheat of some acres has been cut at Milton, parish of Carluke.

## REVIEW OF THE CORN TRADE IN MARK LANE DURING THE MONTH OF AUGUST.

The favourable weather which has been experienced throughout the past month for all agricultural proceedings, has been highly conducive in bringing to an early conclusion the wheat harvest throughout the eastern, southern, and western parts of England, and even north of the Humber rapid progress is making in securing the crops. Much of the barley and oats is also cut and housed, and many of the beans and most of the peas are safe. The appearance of the standing crop of wheat, from the abundance of the straw, led to the expectation, that the yield would be plentiful, and even larger than the produce of last year; on inspection, however, as we noticed last month, the favourable impressions were altered, and now that thrashing has partially commenced, and the only criterion, on which certain judgment can be formed, has been essayed, that of ascertaining the yield per acre, it is proved, we fear, in too many instances, that the return will be much shorter than the sanguine hopes of the agriculturist had anticipated; where five and six quarters the acre had been looked for, only three and four quarters are measured out; and we have heard of even a greater diminution according to the prejudged opinion; added to which, the quality is very uneven, the samples having many thin and shrivelled corns, which of course materially affects the weight and quantity, and which may be rationally accounted for, by the *three days* heavy rain and wind experienced towards the close of June, at the critical period of the blooming of the plant, and when it is most susceptible of injury, succeeded by dry, parching weather, bringing the ear prematurely forward, without permitting time for the juices progressively to swell the grain, and give it that plumpness consequent on a mature ripening; smut, likewise, is found in many instances, with a total or partial failure of corn in many of the ears, which apparently promised a good return. These facts, at this early part of the season can only be deduced, it is true, from a small portion of the crops, but the belief is gaining ground, that the average of the kingdom will not turn out more favourably—and at Liverpool speculation has already begun to revive, founded on these premises. Barley is an abundant crop, and the late rains will prove extremely beneficial to the outstanding grain; that which has been already housed proves *flinty* and *unkindly*, and until it has undergone the usual degree of fermentation in the stack, is unfit for malting; the colour is *white* and *silvery*, and the article in excellent condition, though in some instances thin in quality from the want of moisture; sufficient nutriment on light soils not having been communicated to the ear. Oats promise luxuriantly, and the weight heavy. Beans and peas are yielding well, and of

fine quality and in superior condition, being fit for immediate consumption. In Ireland and Scotland the harvest is not yet sufficiently advanced to form any just opinion of the general produce; but reports from the southern and western portions of the Sister Isle speak favourably of wheat and oats, but in the northern districts the wheat crop is not expected to prove so satisfactory; and as the harvest, as well as in Scotland, has been retarded by the weather, it is rendered more liable to casualties, though in the latter country the promises are by no means discouraging.

The business in Mark Lane as well as in the leading country markets has been dull and depressed. Millers, owing to the scarcity of water and the calmness of the weather, being prevented employing the full power of their mills, have bought merely to the amount that their immediate wants required; and as the harvest advanced so quickly, and the stocks of old wheat were still found to be large, their operations have been limited, at a reduction in price of 5s to 6s as compared with the currencies at the close of the previous month: the best red wheats of the new growth are not worth more than 37s to 38s, old 39s, and in corroboration of the inequality of the new samples, Cambridgeshire and Lincolnshire wheat has appeared in Mark Lane, weighing only 53 to 54lbs, and not valued higher than 28s to 30s; white wheat may be noted at 42s to 43s; fine, 44s to 45s.

In bonded wheat nothing has transpired to relieve the speculators; strenuous and laudable efforts have been made on the part of the merchants and corn factors of Plymouth, who are interested in foreign wheat, in which the bonded holders in London have warmly co-operated, in petitioning the government to permit the bonded wheat to be ground into flour for export as well as for the manufacture of biscuit, as a favourable opportunity was now afforded for the sale of both articles, in consequence of the failure in the crops in the United States and the rapid rise in the price of flour, enabling shipments to be advantageously made from hence to South America, the West Indies and other parts supplied from the American ports. The President of the Board of Trade however, though he could not contravert the justice of the appeal, refrained from countenancing the measure, on the plea, that the session was too far advanced to allow ministers to agitate any question relating, however remote, to an alteration in the corn laws, as the landed interest looked with much jealousy and suspicion upon insulated enactments of such a nature; and thus capital to the amount of fully one million and a half of money remains locked up; and the boon which government might have granted the holder of bonded wheat has been neglected. When the prospective view of the speculator can find an object, though distant, to ground a chance of partially relieving his capital, it makes the weight under which he is labouring the more tolerable, but now the continuance of favourable weather, having thwarted all his speculations,

it becomes a dreary reflection, the period that must elapse, before another incentive can be given to his hopes, which are only likely to arise on the approach of the harvest of 1836.

The flour trade has worn a heavy aspect, and at the beginning of the month, millers, owing to the decline in wheat, reduced the price of best town made qualities 2s per sack, the top quotation becoming 38s. Ship qualities have also given way 1s to 2s; but as the supplies coastways have been limited from the difficulty in manufacturing the article from want of wind and water, added to the bakers being generally short of stock, prices have latterly remained steadily at this reduction. The scarcity of sour and particularly sweet American flour, has prevented shipments to any extent to be made to the United States; prices of the former have ranged at from 18s to 20s per barrel, and the latter was worth 25s to 26s.

The alteration in the duties have consisted of an advance of 2s per qr. on wheat, from 44s 8d to 46s 8d; and 3s per qr. on Peas, from 11s to 14s; and a decrease of 1s 6d per qr. on Oats, from 12s 3d to 10s 9d. We noticed last month the sudden diminution in the duty on peas, owing to the high amount of the Warwickshire average; it has been since struck out by the Inspector General, and stated to be a clerical error.

The receipts of barley have continued extremely limited, but with the addition of the foreign samples, which had been entered for the consumption, have proved fully adequate to the demand. The sales with a few exceptions, have been confined to grinding qualities, which have receded 1s per qr, realizing from 25s to 27s. The new barley samples, which have appeared at market, exhibit much disparity of quality, some being thin and others plump and heavy, but nearly the whole more or less *steely*; even the Chevalier, which is remarkably fine in color and heavy, was not free from this defect; and as the quality was not sufficiently *kindly* for Malting, added to the warmth of the weather, the new parcels were not worth more than 30s to 32s per qr.

In the prices of malt little or no alteration has taken place; fine parcels remaining saleable at the previous currency; and other descriptions not meeting much attention.

Though the supply of Irish oats has not been so large as the previous months, yet the arrivals having exceeded the amount, which it was calculated Ireland was capable of furnishing us with, together with the appearance of new samples in our markets, and in such fine condition as to render them fit for immediate use, have caused the trade to rule extremely dull, and to assume a very different character to what was anticipated; the calculations as to the supplies which we should require, and which have been formed on the previous consumption, have been so far frustrated, in consequence of the extent of the shipments from the sister kingdom, and the

early state of the crops, together with the exportation of a large quantity of foreign oats being entered, these circumstances have induced consumers and dealers to confine their speculations to the narrowest compass; expecting weekly lower rates, and which have succeeded to their wishes; English qualities having receded 2s to 3s per qr; Scotch descriptions 1s to 2s; Irish potatoe samples 2s per qr, and light feed 3s to 4s per qr, quotations being from 16s to 18s per qr. Speculation having been made in foreign oats to a considerable extent, every effort has been attempted to reduce the duty, which remains at present 10s 9d, and though a probability exists that it will decline to 9s 3d, which prevents holders from entering their stock at present, yet below that point there is little chance of its reaching, and with the amount of duty and the low prevailing currency, a heavy loss must at all events be sustained on the article, say from 3s 6d to 5s per qr, but still it is preferable at once to submit to the sacrifice, than incur the additional risk and expense of another season, and we may look forward to 200,000 qrs being brought in for the consumption. The amount in bond in the united kingdom on the 5th of August, was 390,873 qrs, of which 186,155 qrs are in London in bond, good fresh feed is not worth more than 12s to 13s, and brew qualities 14s to 15s; old Danish and Pomeranian parcels are noted free at 18s to 20s; Petersburg, Riga, and Archangel 21s to 22s.

Beans, during the early part of the month, declined 2s per qr, in consequence of the favourable reports of the crop, and the continued admission of foreign qualities; latterly, however, the trade has become more firm, and though we have new Mazagen, Longpods, and Harrow beans at market, fine in quality and condition, yet prices have remained steady at the previous depression; new Mazagan obtaining 33s to 34s; Longpods 32s to 34s.

Peas, in the beginning of the month, met a dull and heavy sale at a reduction of 4s to 5s per qr, in consequence of the duty suddenly declining, and the appearance of several foreign free parcels on the market. New samples, of fine quality, at 30s to 32s both for white and grey descriptions, since which the trade has rallied fully 1s to 2s per qr, new white being noted at 34s, and grey 30s to 33s.

New winter tares have come to hand dry and good in quality, realising 6s to 6s 6d, fine 7s per bushel.

New rapeseed is in limited supply, but the samples bold and in excellent condition, and obtain 29l per last from the crushers.

Caraway, owing to the inferiority of the crop, has advanced above 4s per cwt, being noted at 50s to 52s.

New white mustard seed, though fine in quality, came at first sparingly to market, and obtained 9s 6d to 10s per bushel, but as the arrivals have increased, it has declined 1s 6d to 2s per bushel; the best parcels not bringing more than 8s; new brown has been dull at 11s to 12s.

During the month of August, the following quantity of grain and flour has arrived in the port of London.

|              | Wheat. | Barley. | Malt. | Oats.  |
|--------------|--------|---------|-------|--------|
|              | qrs.   | qrs.    | qrs.  | qrs.   |

The new wheats in France are now coming freely to hand, and have caused a further depression in the currencies, for though a disparity in quality appears, yet the quantity being abundant, notwithstanding that the yield is not equivalent to the number of sheaves, it will effectually check all chance of the prices rallying. At Paris, the quality is represented to be lighter than that of last year; purchases could be made at 32s 8d, but offers do not generally exceed 31s 3d, while the finest descriptions are held at 35s 10d. Barley is reported only an ordinary crop, and barely equal to that of last year. The accounts of the oat crops vary materially, not only from different parts of the country, but even in the same districts; in some places it is good, in others, middling, and in part, bad. In Brittany and the lower parts of Normandy, the harvest will be satisfactory, as well as in the southern departments. The continuance of dry hot weather is increasing the inconvenience and detriment to the farmer. Flour meets, generally a brisk demand, but as the mills are in many instances not working half their force from the want of water, any improvements in the value of the article is not likely to affect the currencies of wheat. At Marseilles business has been rendered quite stagnant, by the re-appearance of the Cholera, as well as at Toulon.

The Italian markets are in a very languid state; the harvest throughout the Neapolitan and Papal States, as well as in Sicily, having proved abundant, with considerable stocks of old wheat on hand, and anticipated large arrivals from the Black Sea, where plentiful supplies have been received from the interior, there appears little chance of the prices rallying. Barletta wheat may now be purchased at 20s 6d. At Trieste, however, prices of Linseed and Rapeseed are likely to rule high owing to the failure in Lombardy and Hungary, and orders are already transmitted from them to Messina to purchase the former article.

By the latest advices from Athens the harvest is represented to be very abundant throughout Greece.

At St. Petersburg the grain trade towards the middle of July became more animated, in consequence of the demand for rye to meet the wants of the interior, and prices have considerably advanced,

being much higher in proportion than that of wheat, the latter article, for Kubanka quality, being held at 30s 1d, and rye selling at 30s. The stocks of all grain are much diminished, and fears are entertained that the wants are likely to be severely and extensively experienced, before the supplies of new corn can reach the different markets. Speculation, by the impolitic interference of the Government, has been completely paralyzed. The merchant, who may have embarked capital in grain, not knowing, at what period or at what price, the Government will dispose of the store in the national warehouses, and not content with suddenly allowing an influx of the article to come upon the market, and realizing the currency of the day, they affix their own price much below the current value, and at rates ruinous to the private holder—a proceeding in a mercantile point of view, intolerable, and at the same time unjust to the honest trader, who is totally incompetent to compete with the all-powerful influence of the Autocrat's government; latterly however, grain has again declined, and wheat as an import would not obtain more than 27s; Rye 24s 8d; and Oats 11s 8d. At Riga the crops promise to be good, and wheat is nominal in value at 23s 4d to 27s 8d; Courish rye 22s 10d. The weather was favourable, but the harvest will be late, and consequently few shipments of new grain will be made this season. At Danzig the trade was dull and prices barely supported; white wheat was held at 31s, high mixed 29s; high mixed of 60lbs 25s. The weather had been stormy and ungenial, more like October than August, which would, it was expected, retard the harvest. In Mecklenburg heavy gales of wind had been experienced, which had damaged the standing corn, but the greatest injury had been sustained throughout Denmark and Jutland, where a kind of hurricane had prevailed for three days, laying waste, in some instances entire fields of grain, in others, committing only partial loss; but on the whole, the damage is estimated at least at one-fourth the aggregate produce; so that some farmers will be incapacitated from paying rent or taxes, or finding enough grain even for seed. At Wiemar and Rostock, wheat remained at 25s 6d; barley 14s to 15s; oats 13s to 14s. At Lubeck, wheat was held at 23s; rapeseed 25l to 25l 10s. At Copenhagen, grain had advanced from 10 to 15 per cent, and in fact, few holders would sell under existing circumstances. Rapeseed was noted at 25l 10s to 26l, the crop having been secured before the storms. At Hamburg the weather had been stormy and unsettled, but the wheat trade was in a dull state and purchases confined to the consumers. Red Anhalt wheat was noted at 25s; Magdeburg 24s 6d; Mark and Mecklenburg 26s 5d. New peas had obtained 22s to 23s 10d. In oats nothing doing and prices lower. Rapeseed was also dull, owing to the reports from this county; Mecklenburg and Holstein qualities 25l 10s to 26l; Dittmarsh and Glückstadt 26l 5s to 26l 15s. Red cloversseed had advanced in price owing to the unfavourable accounts of the crop, and was noted at 34s 6d to 37s per cwt.

### DISTRESS—IRELAND.

(From the Times.)

The painful subject of Irish famine came again before the House of Commons on Monday. Mr. S. Crawford on that occasion discharged a duty, of which every humane man must feel the imperative and solemn nature, by pressing upon the attention of Parliament the necessity of some act of prompt and resolute legislation, in the hope to render less frequent, if not wholly to avert, the recurrence of evils which are as disgraceful to the upper classes of Ireland, as they are afflicting to the poor. We wonder how men can ever again hold up their heads in places where they are flatly denounced in unmeasured terms as the most heartless beings on the surface of God's earth—the most oppressive in their dealings—the most selfish in their feelings—the most unchristian in their spirit towards their fellow mortal. Yet such is the language in which the great bulk of Irish landlords have been addressed, in writing and in speech, by those who know them; such, in substance, was the language of Mr. S. Crawford, who blamed Parliament for “allowing session after session to pass without attempting to enforce, *from the rapacious landlords* of Ireland, a contribution to the means of relieving the aged, the feeble, and the distressed.” How does Mr. Crawford describe the rents exacted from the poor of Ireland by their landlords? “In many parts of Ireland the rents reserved exceeded *the whole produce of the land*.” A tolerable sure receipt for the starvation of the tenantry!

Is it not something more than monstrous that these owners of the soil, who do so much to ensure the misery of their humble neighbours, to whom they ought at all times to extend a cordial and parental protection, do absolutely *nothing* for their relief? Is it not a standing stigma upon human nature, that landlords who draw thousands of pounds per annum from their estates, and spend those sums in distant countries, should, when the hour of distress arrives, throw the entire burden of charity upon us; and then when you propose that they should be compelled by law to perform the duties which are here entailed upon and freely undertaken by English proprietors, they twist, and writhe, and shuffle, and cry mercy, declaring “that Ireland would be ruined by such an innovation, and that English poor laws, and the wretchedness which they had caused, ought to prove a warning to Parliament respecting Ireland, rather than a temptation.” Nothing in the shape of impudence can exceed this mode of talking, as if any distresses connected with English poor laws had been inherent in the laws themselves, or as if the want of them had not produced more suffering in one week to the Irish poor than their maladministration had inflicted on those of England in a twelvemonth. If the landlords are not made to

feel that the wretchedness of their tenantry will recoil upon themselves, Parliament grants a bounty on their barbarity, and England, as has been the case in every instance, pays out of her own pocket the claims of the Irish poor upon their own oppressors. It is impossible that such a system should be perpetuated. The public will remark, that Mr. Daniel O'Connell took no part whatever but that of dogged silence in the discussion which had for its object the suggestion of some remedy to the distresses of those miserable beings from whom he wrings his own exorbitant income. We will venture to affirm that there is not a landlord in Ireland who charges the poor so high a “rent” as Mr. Daniel O'Connell for a tenement which never yet produced to any man, woman, or infant in the land, a single meal of potatoes.

### THE LORDS AND CORPORATION REFORM.

(From the Times.)

It could be no secret to anybody what fierce and desperate efforts would be made to bully the Peers of England into an abject submission to whatever course of proceeding would best suit the purpose, of the dominant party in the House of Commons, with relation to the Municipal Reform Bill,—we might add, to every other democratic measure, but specifically, at the present moment, to this.

The Lords' debate on Monday evening was most important. An attempt was made by Lord Melbourne, who seems rapidly degenerating into a mere “flash man” of the Radicals, to force their lordships' house into a committee on the Corporation Bill, and thus carry the measure, “hand over head,” in obedience to the sovereign will of the O'Connell faction, without hearing one tittle of evidence, or receiving one syllable of *authentic* information, as to the truth of any of those charges which were brought against existing municipal bodies by the Whig-Radical commissioners, although the validity of such charges has been denied in numerous petitions, and the policy of acting on them, even if demonstrated—that is, acting upon them in the manner enjoined by the Corporation Bill—has been contested in as many more. We never have disputed the assumed fact of the local misgovernment practised by sundry English corporations, or the fact which is notorious, that many of them are irresponsible monopolies, and therefore *must* be mal-administered, according to all human reason.

The necessity for a corporate reform, founded upon such recognition of the inherent constitutional vices of these bodies, was admitted by almost every conservative peer who spoke last Monday against going into committee on the bill.

It is consistent with the tricks and wickedness of faction to represent every exercise of judgment or free-agency on the part of the House of Lords, if

for no other reason than that it is an exercise of the dependence by that assembly, and provided it be connected with any measure which the Whiggo-Raddicals have an interest in pushing precipitately forward, as an act of rebellion against the majesty of the movement, and a forerunner of ruin to the British Peerage. The decision, accordingly, which was come to by their lordships on Monday evening, to hear evidence on some of those startling statements which were laid before them by counsel at their bar—or, in other words, to hear with their own ears from competent witnesses, the truth, and nothing but the truth, with regard to matters which might have been partially represented to them and the other House of Parliament, by a partially chosen commission,—that vote has raised an outcry among the Whig-Radicals, as if the House of Lords, in endeavouring to make themselves acquainted with the corporation question, could have no rational design or purpose but to throw out and annihilate the measure. Now, this question lies within a short compass. The report of the commissioners is or is not the foundation of the Municipal Reform Bill. If that be the groundwork of the Ministerial measure, who, as Lord Lyndhurst puts it in his inimitable speech—who are these commissioners? Having a high public trust to execute, and being of necessity professional men, they ought to have been taken indiscriminately from all parties, upon no other principle of selection than that of pure fitness for the office, so as to impress the public and the Legislature with a belief that their report would be based on a knowledge of facts obtained through conscientious inquiry, and to serve no ends but those of unbiassed and disinterested justice. But has that been the case? The learned lord alluded to went through the list of twenty commissioners, and with the single exception of Sir Francis Palgrave, ascertained that those fortunate and shrewdly selected gentlemen were one and all *Whigs, or something more than Whigs!* Was Lord Lyndhurst, then, we ask, much out of his reckoning when he pronounced this whole scheme of corporate reform to be nothing more nor less than one enormous Whig-Radical job, set on foot, not for the sake of any great national object, but to strengthen and consolidate still further the political party by which the commission has been issued and the measure framed? Well, is the report of such a commission, or rather of such commissioners, each prosecuting his own detached bit of the inquiry unchecked by any revision or control from the rest—is, we ask, such a report to be submitted to by the House of Lords as their sole textbook and authority, whereon to undertake and finish the most momentous revolution in the domestic policy of England which it is possible for the human mind to conceive, when their lordships have it in their power to proceed themselves to the fountain-head of intelligence, to examine their own witnesses, to conduct their own investigations, and to satisfy themselves that the Whig-Radical personages on whom they are commanded by O'Connell and Lord Melbourne to rely, have not presented them with a garbled, faithless, or otherwise imperfect report upon the state of the corporations? Now, we repeat, will any man with a grain of sense or honour pretend that in thus desiring to inform themselves upon a question which involves such a mass of property, and such a multitudinous diversity of ancient rights, and of perennial interests—a question on which there is *prima facie* ground for strong suspicion that they are in danger of being made the dupes of factious machinations—the House of Peers have done an act, or betrayed an intention, for which they ought to have their legislative and judicial privileges abolish-

ed, and to be, as a class of high functionaries in this empire, laid prostrate in the dust? "Aye," say the revolutionists; but we say "No;" and the people of England are with us.

But again, quoth Lord Melbourne, the measure is "not grounded on the report of the Commissioners. It is a calumny, or a folly to assert it." Then we would beg leave respectfully to ask his lordship, on what else can it be founded, if not on an official report of some description, unless it be on the statements—the *ex parte* statements—the designing, selfish, insidious statements—of the Whig-Radicals themselves? Is that then, is the asseveration of a Whig-Radical in office, even though it be a Cabinet office, sufficient evidence whereon to justify an independent Legislative assembly for going on slap-dash to a change, universal almost—and almost organic—in the local government of the great bulk of Englishmen inhabiting towns throughout the kingdom? or is it to be alleged against the whole body of Peers, as a crime, that they do not feel themselves authorized, as men of common sense and constitutional principle, to adopt so wild a course? The truth is, that Lord Lyndhurst has infinitely damaged the character of the commission, by exhibiting to public scorn and ridicule the paltry spirit of jealous and sordid faction in which it was appointed. Sure we are that, after such an exposure, the country generally would not hear with patience that the functions of the House of Lords had been devolved upon a score of Ministerial partisans, for the sake of enabling the understrappers of the Treasury to work the Corporate Reform Bill, as they are daily striving to work the registrations under the Electoral Reform Bill, to the sole advantage of the Whig-O'Connell Government. The majority of the House of Lords have been basely accused of employing the examination of witnesses as a screen for the defeat of the bill. The reckless beings who make this foul charge dread nothing so much as a calm inquiry into facts, and are therefore furious that the Lords will not vote and make laws in total ignorance of them. It is certain that their lordships have buckled to the examination of witnesses, like men who are resolved on executing vigorously a great and arduous task. We have no time to do more than refer our readers to the examination which took place yesterday upon the circumstances of the City of Coventry, and the *exemplary fidelity* with which it is there sworn by a respectable witness, that the Municipal Commissioners discharged their sacred trust in certain boroughs, with respect to which matters have come out, affecting the report of the Commissioners in a way which will go some length towards accounting for the anger of the organs of the Whig-Radicals at the determination of the House of Lords to get at the truth of the several cases brought before them, and not take it on the very frail authority of Commissioners who have been packed, or of Ministers whose chief object it is to keep the salaries of office to themselves. Thank God—and the sentiment will be echoed by every honest man in England—thank God, we have in the House of Lords, men who will neither be bullied themselves, nor suffer the national interests to be sacrificed. The implied menaces of Lord Melbourne towards his brother Peers are the most pitiable signals of distress which the Radical-Whig Government has yet exhibited from the mast-head.

#### THE BUDGET.

The Chancellor of the Exchequer brought forward his Budget on Friday Aug. 14; in the early part of his observations, he adverted to the enormous amount of

reductions which had been carried into effect since the peace—no less a sum than 40,191,000*l.* of taxation having been reduced since 1814; of which sum nearly 7,000,000*l.* had been reduced by the Government of which Lord Grey was the head, notwithstanding the great reductions both of taxation and expenditure which had been previously effected by the Administration of the Duke of Wellington, and by which further reductions had of necessity been rendered more difficult. The Right Hon. Gentleman proceeded to institute a comparison between the receipts and expenditure as estimated by Lord Althorp in July last year, and as shown by the actual balance-sheet ending July 5, 1835. The following are the results:—

|                                                                                                                               |              |
|-------------------------------------------------------------------------------------------------------------------------------|--------------|
| Estimated Income for the year ended                                                                                           |              |
| 5th July, 1835 .....                                                                                                          | £45,778,000  |
| Actual Income .....                                                                                                           | 45,539,000   |
| Decrease .....                                                                                                                | £239,000     |
| Estimated Expenditure .....                                                                                                   | £44,801,000  |
| Actual Expenditure .....                                                                                                      | 44,334,000   |
| Decrease of Expenditure ...                                                                                                   | £467,000     |
| Deduct Decrease of Income .....                                                                                               | 239,000      |
| Balance .....                                                                                                                 | £228,000     |
| Add Estimated Surplus, 1835 .....                                                                                             | 977,000      |
| Actual Surplus on 5th July, 1835                                                                                              | £1,205,000   |
| The following is the Chancellor of the Exchequer's calculation of the Income and Expenditure for the ensuing financial year:— |              |
| Income .....                                                                                                                  | £45,550,000  |
| Expenditure { Charge of Debt } £30,580,000                                                                                    | } 44,715,000 |
| { Supply .... 14,135,000 }                                                                                                    |              |
| Surplus .....                                                                                                                 | £835,000     |

The total possible charge in the present year on account of the West India Loan is stated at 1,010,000*l.*, which if set against the above estimated surplus of 835,000*l.*, would leave, not a surplus on the ensuing year, but a deficiency of 175,000*l.* The probable charge within the year on account of the loan is estimated at from 600,000*l.* to 700,000*l.*, leaving a real surplus on the year, therefore, of from 150,000*l.* to 200,000*l.*

The Chancellor of the Exchequer proposes to reduce the duty on Flint Glass from 6*d.* to 2*d.* in the pound, under which reduction he calculates upon a loss of revenue in the first year of from 60,000*l.* to 70,000*l.*, but that deficiency will be entirely supplied by increased consumption in succeeding years.

He next proposes a reduction of the Spirit License Duty in the cases of those publicans whose consumption of spirits has been very small compared with the consumption of malt liquor, and upon whom the additional duty imposed last year has operated very oppressively. The loss which the revenue would sustain from this alteration is estimated at 40,000*l.*

The only other reduction or rather repeal of duty proposed by the Right Hon. Gentleman is that of Stamps on Awards for sums below a certain amount in Ireland, by which a loss of revenue of about 500*l.* would be incurred.

A number of most interesting facts are brought forward by the Right Hon. Gentleman in proof of the increased and increasing resources of the country, amongst which is the fact of duty having been

paid in one single quarter into the legacy department of the Town-duties Office alone, upon property amounting to no less than 6,812,941*l.*—"an exhibition of such an enormous increase of wealth as few other countries perhaps in the world could boast of." The official value of the exports in 1784 is stated to have been 15,000,000*l.*; on the average of the four years ending 1830, 65,330,000*l.*; on the average of the four years 1831, 2, 3, 4, 78,179,000*l.*, showing an actual and positive increase in the last four years in the exports of the country of 12,849,000*l.*; this increase being more than two-thirds of the whole official value of the exports in 1784.

The returns of the Savings Banks show an increase in the number of depositors in the last year of 33,972, and in the sum deposited, of 956,861*l.*; the total number of depositors being now 501,163, and of amount deposited 15,430,814*l.*

The beneficial effect which has actually resulted from the practical operation of the Poor Laws in several Unions, specified in detail by the Chancellor of the Exchequer, was adverted to by the Right Hon. Gentleman, in proof of the opinion which he had no hesitation in expressing with reference to the pressure which at present exists upon the agricultural interests, that no reduction of taxation that could be made would produce any thing like that degree of benefit or relief to agriculture which they would derive from the reform of the Poor Laws; under which reform it was considered probable that within a short period the agricultural interest would be relieved or benefited to the extent of 1,500,000*l.* a-year.

The Right Hon. Gentleman then called attention to the facts, that since the year 1820 a reduction in the expence of collecting the revenue had been effected to the extent of 620,362*l.*—and that whilst the amount of sinecure offices left unprovided for by abolition in 1810 was 191,000*l.* a year, in 1834 the amount was only 17,000*l.* a-year.

## THE LORDS AND CORPORATION REFORM.

(From the Morning Chronicle.)

The course which the Lords have taken must be encountered with a spirit and resolution worthy of the people. The Lords have shown the purpose to reject the Municipal Reform Bill, but they reckon on the exhaustion of the public indignation between the manifestation of the purpose and the accomplishment; and the hearing of evidence is therefore conveniently interposed, to deaden the shock, as it were, and take off the sharpness of disappointment. The Lords probably contemplate another advantage in this device: namely, that it will give them the opportunity of watching the temper of the public, and of not provoking it too far, if it does not cool with delay. The Lords are trying an experiment on the earnestness of the people. If the people allow their attention to be wearied out—if they flag in the struggle with the wilfulness of their enemies—if they appear inert and indifferent, the event is certain; but, on the contrary, if they make a lively and spirited, and, above all, a persevering stand, the Lords may yet take counsel from their best, their justest, their only wise and honest advisers—their fears. The hearing of evidence is undoubtedly a dextrous expedient for delay, and, with it, for trying the resolution and constancy of the people. The time ostensibly spent in hearing evidence, will really be a time wasted in trying the public purpose. Upon the way in which the people fill it, we still think that the result will very much depend. But

be the event what it may, our fellow-countrymen should have the satisfaction of knowing that they have done their best, and shown as high and resolute a spirit as the Lords, who would be their masters. While the Lords are hearing their evidence against the bill, the people must be everywhere putting forth the evidence of their resolution to have it. The evidence against the bill will be delivered at the bar of the House—the evidence for the bill must be given by the voice of the country. The people are the witnesses of the existence of the evil, and are competent judges of the value of the remedy.

The trite proverb says, that "he who wears the shoe, best knows where it pinches;" but the Lords deny this doctrine, and prefer taking the evidence of the shoemaker, as to the fact whether the wearer is galled and lamed by the shoe. The opinion of the people as to corporate abuses had its legitimate expression in the Commons' House, and now the town clerks, &c., are to be heard against the measure of redress in the Lords. That no one will heed the evidence of persons interested in the abuses, politically or otherwise, is certain enough; but the hope of our adversaries doubtless is, that it will weary out the public, and allow of the evaporation of anger at the predetermined fate of the Bill. The evidence is taken, as woolpacks are used at sieges, to deaden shot. To fire at such a bulwark were a waste of ammunition, and our forces must keep up a lively and steady bombardment, directed at the main object, around which these temporary defences are thrown. A shell a minute was the practice by which the French reduced the citadel of Antwerp, and about a parallel bombardment of the citadel of Toryism by public opinion will serve the present purpose. The most active demonstrations within the pale of the constitution are now the best.

If we were to attempt to add anything to the emphatic warning which Lord Melbourne gave to the Peers, it would simply be the citation of that very ugly admission of weakness made by Lord Lyndhurst, that the fall of aldermen might drag down the Lords! What can that body venture to attempt, whose nearest and dearest association of interests is with aldermen? Have the proud Peers, the doughty Barons of England, come to this, that the whiff and wind of the falling alderman's robe is enough to puff them from their station of authority? Is it conceivable that any power can stand, to the stability of which the existence of aldermen is essential? Lord Lyndhurst takes a pitiable view, indeed, of the case of the Lords.

The Tories are as contradictory as any lover of truth need desire, in their objections to the Municipal Reform Bill. When the disfranchisement of the freemen was discussed in the Commons, we heard a vast deal of hypocritical prate about the injustice of supposing that the poor were not as trustworthy as the rich; but Lord Lyndhurst objects to the proposed franchise, expressly because it will extend to the lower classes, and he assumes that they must oppose and over-rule the intelligence of the more affluent orders. Thus, unless a poor man happens to bear the name of a freeman, he is concluded by the Tories to be a being devoid of reason, and a destructive. We quote his Lordship's words:—"The electors were to be householders. If their Lordships looked at the list, they would find that persons occupying under 10*l* were twice the number of those above that amount; and that inferior class of persons were always of the movement party. Thus the intelligent and respectable classes would be swamped by the great mass of the lower classes." And this is one of the professed champions of the poor!

## TORY CONSPIRATORS.

*Times*, Aug. 5, 1835.

The majority of the House of Lords have been basely accused of employing the examination of witnesses as a screen for the defeat of the bill. The reckless beings who make this foul charge dread nothing so much as a calm inquiry into facts, and are therefore furious that the Lords will not vote and make laws in total ignorance of them. It is certain that their Lordships have buckled to the examination of witnesses, like men who are resolved on executing vigorously a great and arduous task. We have no time to do more than refer our readers to the examination which took place yesterday upon the circumstances of the city of Coventry, and the *exemplary fidelity* with which it is there sworn by a respectable witness, that the Municipal Commissioners discharged their sacred trust in certain boroughs, with respect to which matters have come out, affecting the report of the Commissioners in a way which will go some length towards accounting for the anger of the organs of the Whig-Radicals at the determination of the House of Lords to get at the truth of the several cases brought before them, and not take it on the very frail authority of Commissioners who have been packed, or of Ministers whose chief object is to keep the salaries of office to themselves. Thank God!—and the sentiment will be echoed by every honest man in England—thank God we have in the House of Lords men who will neither be bullied themselves, nor suffer the national interests to be sacrificed. The implied menaces of Lord Melbourne towards his brother Peers are the most pitiable signals of distress which the Radical-Whig Government has yet exhibited from the mast-head.

*Times*, June 14, 1835.

The country is now forewarned of the projects of the Tory conspirators. Those latter complain of it as a pure calumny, when we charge them with manœuvring for a return to office. In their sense they are right: it is not a return to office only which could at this moment fulfil the ambition or stimulate the violence of the Tory Chiefs—it is the purposes to which official power might in their hands, according to their hopes, be converted. The work of reaction and destruction—the demolition of all the yet unfinished labour of the friends of free and upright government—the suffocation in their cradle of those numerous, some of them excellent measures which have just seen the light, and which are deemed by THE PUBLIC ENEMY (THE OLD AND SCOTCHED AND WRITHING DRAGONS OF THE OLIGARCHY,) so many clinchers of their own everlasting exclusion from that which alone gives value to office in their eyes—a monopoly of dominion over the spoils of the entire empire. The East Indian monopoly endangered—the West Indian tyranny denounced in its fundamental principle as no longer to be endured—the Bank monopoly touched somewhat disrespectfully, though certainly not enough, by the existing Government—the HITHERTO SACRED ABUSES OF CLOSE CORPORATIONS EXPOSED, AND ON THE POINT OF BEING SIGNALLY PUNISHED—the Church of both countries—that rich storehouse for the destitute scions of the Aristocracy; that mass of perversions of whatever is best and holiest to the meanest and vilest use—the Church itself about to be cleansed of its impurities. Why all these together, are enough to drive Toryism mad, and to nothing short of madness has the Tory faction been at length exasperated. . . . . They

reason rightly as to the end, but their premises bespeak deplorable infatuation. They do not err in believing that the accomplishment of all the great measures above glanced at, would be absolutely and for ever inconsistent with those views which constitute the moving power of politicians of their clique, or in resolving to check, if they can, and extinguish such schemes of public good in their infancy; but their error, their frenzy, was in the imagining that they possess or can ever attain to such supernatural power. The Tories might as well dream of uprooting this island from her ocean seat, as of crushing the seeds of universal Reform, which have sprung up every where from a congenial soil, and cover every spot within her boundaries. The whole band of Conservatives have stood aloof from the people of England, and to this hour know them not. *They keep down the Nation! They re-impose the old cast-off shattered yoke! Where are their means?—Where their resources?—Where their hundreds of thousands of armed men? Where their hold over the affections of a people, amongst whom they are but an isolated and hated coterie.*

*But will they govern without a House of Commons, or in spite of them? Will there be a Parliament of Peers at York, and a Commons House of Parliament in London? What times were they, and in what did they terminate? Whither would these maniacs drive their unhappy country?*

#### ORANGE LODGES.

*(From the Globe.)*

Orange Lodges have at length received their quietus; and not only Orange Lodges, we hope, but all secret political societies or affiliations, of whatever character or party, will shortly be put down by a vigorous and decided act of the legislature. The rough treatment which Orangeism received in the Commons last night, from all sides, afforded a gratifying proof of the good sense and good feeling of the house, and augurs well for the future tranquillity of Ireland. The condemnation pronounced upon the introduction of Orange Lodges into the army was especial and unanimous. Even Colonel Perceval, the Grand Treasurer, and Mr. H. Maxwell, the Grand Secretary of the society, were obliged to admit the flagrant impropriety of this act of the grand lodge. These gentlemen, the very individuals who have signed "marching warrants" for nearly forty different regiments, professed their ignorance of the use which was to be made of these warrants, and denied all knowledge of the existence of Orange lodges in the army! We regret to say that some incredulity was manifested on the occasion; and it does, moreover, seem drawing largely on the good nature of the public, to ask it to believe that a resolution to grant Orange warrants to soldiers, carried in the grand lodge be one party in opposition to the wishes of the more moderate Orangemen, should have been unknown to its principal and most active functionaries—hidden only from two individuals whose duties are to receive its monies and record its acts!

We stated on Monday that the evidence did not go the length of proving that the Duke of Cumberland was personally cognizant of the fact that Orange lodges existed in the army. This, we still believe, is perfectly correct; although Colonel Wood's volunteer defence of his Royal Highness has not by any means improved his position in respect to his alleged ignorance of these transactions. It appears from this gentleman's admission, that the Duke of Cumberland, on the occasion when directly applied to transmit a regimental warrant, had refused to do so. We wish Colonel Wood had been authorised

to add that the Duke had followed up that refusal by some inquiry or other measure indicative of his disapprobation, instead of presiding at an Orange meeting at Lord Kenyon's, where it was resolved that a fee of fifteen shillings should be paid on taking out warrants for forming lodges, but *from which payment non-commissioned officers, soldiers, and sailors, were to be exempted.* It appeared to be the understanding of the house that some more official explanation of the conduct of his Royal Highness would be afforded, and to give an opportunity for that being done, the debate was adjourned till Tuesday next. After what has passed, however, we think it extremely probable that the Duke of Cumberland will be required to make his option between the rank of a Field-Marshal of England or a Grand Master of Irish Orangemen. The functions of both in one person are totally incompatible.

#### CORPORATION REFORM BILL.

*(From the Globe.)*

In what shape the corporation bill will come out of such hands as these it is impossible for human foresight to prognosticate. That the same majority which has thus decisively outvoted ministers on every occasion presented to it, is ready to go on damaging the bill in every mode which may be hereafter proposed, there can be no doubt. It will soon become a question whether, such as the House of Lords may deign to give it, it will become the House of Commons to accept the bill. The representatives of the people will have to decide whether it will be their duty to accept it as an instalment of popular rights on the present occasion, or reject it as an insulting mockery, leaving on their lordships the responsibility of frustrating the just desires of the nation. We must say that the alterations hitherto effected by the House of Lords are not such as would lead us to think the bill worthless. By retaining the parliamentary franchise of the freemen, the House of Lords, as Lord Hatherton frankly and forcibly told them, keep up a body of electors for Tory bribes to act on. By vindicating to them the perpetual abuse of corporation property they keep up the sanctity of prescriptive misappropriation of public funds, deprive the new corporations of a large portion of their revenues, and conciliate the existing freemen by a considerable boon. We do not think they will gain much by this—that the votes of the freemen will at a future election stand them in much stead. At any rate the extension of popular power in matters of municipal government has not yet been curtailed; and while the bill secures the people any particle of influence, while the proposed system of popular election remains unimpaired, we shall hail the bill as good, and use it to get something better.

We must regret the apparent delusion which has brought the candid and liberal Marquis of Northampton into the ranks of the opponents of reform; and we trust that the exaggerated alarms about the security of property, which appear to influence his lordship, will not induce him long to lend a countenance to the only course of policy by which the foundations of property run any great risk of being shaken. Lord Segrave's desertion does not pain us. We abandon to the Tories, without a sigh, his private worth, his public virtues, his acquirements, his wisdom, and the eloquence which prompted his ebullition in behalf of his order. His lordship's elevation to the peerage was a rare subject of Tory reproach against a reforming ministry. The party will now, perhaps, think him fitter for the peerage when he joins their ranks.

## THE IRISH TITHE BILL.

*Times*, Aug. 20, 1835.

We understand that the House of Lords will not oppose the committal of the Irish Church Bill, but that in Committee they will strike out those parts of the measure which spoliate the REVENUES OF THE IRISH CHURCH, and which have shocked to the last degree every sincere Protestant who values the maintenance of pure reformed religion above all political or factious considerations.

*Times*, May 22, 1834.

In Ireland we doubt not that the revenues now absorbed by that UNNATURAL WEN, CALLED THE IRISH PROTESTANT CHURCH, must eventually be, alienated to more general objects; and that on including, as must be, all sects of Christian ministers in the great measure of payment by the State, the income allotted to the Established Clergy *must be proportioned to the duties they perform, and to the numbers and wants of the community which they serve.*

*Times*, May 27, 1834.

"The point in dispute with regard to the Irish Church is pretty nearly this: whether the whole revenue of the Irish Church, shall, in its new form of a land tax, be appropriated in *perpetuum* to the Protestant Established Clergy; administering to the spiritual wants of about one-sixth of the gross population of Ireland, or whether Parliament shall assert the right of determining the revenue to be bestowed upon the Clergy according to the amount of duty performed by them—that is, ACCORDING TO THE PORTION OF THE PEOPLE WHO APPERTAIN TO THE ESTABLISHED CHURCH? It were a fruitless task at this time of day to argue such a question in detail. He who denies the right to Parliament to deal with revenues so circumstanced as national property, must hold that the temporalities of the Church were established exclusively for the personal enjoyment of the Clergy; that a Christian laity constitutes no necessary member of a Christian Church; and that a province, nay, a kingdom, which contains not a single Protestant congregation, is bound nevertheless, to throw away for ever an enormous mass of property upon Protestant Ministers who have no souls under their spiritual guidance, or in other words, who discharge no clerical functions, while the demands of charity, of moral education, and of spiritual instruction for the great body of the people, are left altogether unprovided for. But here we take leave of a subject upon which the country most deeply interested HAS WITH ONE VOICE DECLARED ITSELF. Ireland—Episcopal, and Protestant Dissenting—Catholic Ireland—these three forming the entire nation have resolved on a re-adjustment of the entire system of Church property, and REDUCED THE LEGISLATURE TO A SINGLE COURSE. The very abstract argument whereon the Church of England has ever been defended as a national church—namely, that of its embracing the majority of the nation—that argument when applied to Ireland, CUTS AWAY THE NATIONALITY OF THE IRISH CHURCH, and reprobates the everlasting and total absorption of the only fund which has at any time been appropriated to religious ends and uses in that country, by a Clergy administering to one-sixth of the people, as UTTERLY UNJUSTIFIABLE AND REVOLTING."

## THE AGRICULTURAL INTEREST.

*(From the Mark Lane Express.)*

The session is now rapidly drawing to a close, and although in a political point of view, we yet anticipate proceedings of weighty, nay, of almost overwhelming importance, still that important disclosure to which all

look with the greatest anxiety, namely, the financial statement of the Chancellor of the Exchequer has been made, and the class which by *candidates* out of the House, and *hon. members* in the House of Commons, is admitted to be suffering the most extreme degree of distress, has obtained of relief, what? Abundance of *commiseration*, and 110,000*l.* in aid of the county rates. The Tories, when seeking office and seats in the House of Commons, upbraided the Whigs with neglecting the interest of the agriculturalists, nay, they even branded them with being decidedly hostile to that interest. The Whigs as often as occasion needed, upon their return to office, appealed to the conduct of the Tories when in power, as evidence of their disinclination to do more for the benefit of the farmers than they the Whigs had done, and held out hopes of something being under consideration for the improvement of their condition. The Whigs were turned out, and the Tories came into office, the Tories were in their turn ousted, and the Whigs returned to power, but not one single step has been taken by the really influential men of *either* party to raise the agriculturalist from his present fallen condition. We are not blind to the difficulties which in a financial point of view, stand in the way of any considerable reduction of taxation. We are not weak enough to imagine that with a surplus of revenue so limited as that which the Chancellor of the Exchequer has now at his disposal, the Malt-tax, or even a moiety of it could be taken off, but when we look back and see the fostering hand which not only the Whig but the Tory Governments of this country have been extending to the commercial class, we do not think it was too much to expect that some disposition should have been evinced to succour the agriculturalist in his pressing hour of need. Out of little but little can be bestowed. The Chancellor of the Exchequer has deemed it advisable to reduce the duty on flint glass not only for the purpose of preventing smuggling, but also for the sake of encouraging the manufacture of that article. Would it have been too much to expect that as a measure of evenhanded justice to the agriculturalist, he should, at the same time, have reduced, or altogether taken off the duty on hops. We have no doubt that we shall be told that the relief afforded by the repeal of the duty on hops would be exceedingly partial, affecting only a few individuals. The statement is true as the case now stands, but if the hop-grower were unfettered by that obnoxious tax, the price of hops would be materially reduced, the article would be more extensively used by the large brewers, instead of the pernicious drugs which are now employed as a substitute, the cultivation of hops would be extended, and an increased demand for agricultural labour would follow, as a necessary consequence. The boon would not be a large one, neither would the sacrifice be great, but the act itself, small though it were,

would be a recognition of his right to relief, and evince a disposition, when means should be afforded, to relieve his burthens. The real truth, however is, the fault rests with the farmers themselves. Were it not that the suffering which the tenant farmer now endures comes under our notice, daily, through a variety of channels, we should be inclined to ascribe the loud complaints which are, in some instances made, to what has been called the proverbial disposition of farmers to grumble; and to disbelieve that distress existed at all. We might be disposed to agree with the editor of the *Courier*, who observed last week—

“We are sorry we cannot quite go along with the right hon. gentleman in what he states about agriculture. In some districts it may be depressed; but we are well satisfied that, speaking of the empire at large, it was never at any former period, in so flourishing a condition. How, were it otherwise, are we to account for the lowness of prices, coupled with the virtual exclusion of foreign corn, and the rapid increase of population? On the whole, we congratulate our readers on the prospect presented by the state of the country. It is, in most respects, highly satisfactory.”

There is not a class of individuals in the whole commercial, manufacturing, or operative communities of this country, from the most extensively connected and opulent merchants upon the London Exchange, down to the fraternity of chimney sweepers, which does not steadily coalesce and perseveringly call the attention of the leading and active members of the Government to any measure about to affect its interest, or to the peculiar condition of its respective trade or calling. Day after day do we hear of deputations, first of this trade, and then of that trade, waiting upon the Chancellor of the Exchequer. But what do we hear of the farmers? Every now and then some county member gets up and presents a stray petition on the subject of agricultural distress, and once or twice in a session some real friend of the farmer, makes a motion declaratory of the distressed state of the agricultural interest, or for the repeal of a tax which he knows beforehand will not be granted, and there ends the matter. Not so with the commercial and trading communities. No sooner were the extent of the alterations about to be made by the Peers in the Municipal Corporation Reform Bill known, a measure by the way, rather affecting the privileges than the pecuniary interests of the parties concerned, than meetings were called, and petitions to the legislature prepared and signed in almost every town of consequence in the kingdom. Nay, we venture to affirm that more petitions have been presented for the repeal of the stamp duties upon Newspapers during the present session, than from the whole agricultural body for relief of agricultural distress. We now repeat that which we have often before stated, that nothing short of one uniform system of organization by which petitions may be prepared and laid before the legislature by the members representing the agricultural interest, *without reference to political principles*, and supported out of doors by the whole agricultural body, will ever obtain that attention which the justice of their cause demands, and without which the growth of corn for the maintenance of the British population will be transferred to foreign climes.

## ORANGE LODGES.

(From the Times.)

Mr. Hume's motion against Orangism, which was supported by a large majority of the House of Commons, is to be considered under two points of view—1st, the existence of Orange lodges in the army, and the connexion of his Royal Highness the Duke of Cumberland with them. On the part of the subject relating to the introduction of such a plague among the troops, there can, we presume, be no difference of opinion. Men who know what an army is, or ought to be, must be aware that any bond of action or co-operation but that of military duty, including obedience to the lawful commands of their officers, is ruin to the discipline of any soldiery, otherwise the best disposed. In a country, moreover, where civil dissention is unfortunately too frequent, and where the armed force is brought from time to time into collision with the people, nothing can be more lamentable than the inoculation of the army with a spirit of partisanship on either side, or more reprehensible than the conduct of those by whom such a mischief is perpetrated or encouraged. It is impossible to shut our eyes to the contingency, already described in this journal, and dwelt upon by Mr. Sheil on Tuesday night, of the spread of Orangism among the Protestant troops, leading to the infection of the Roman Catholic soldiers with the counterpoison of defenderism, or any of those other forms which disloyal Popery has assumed within the last fifty-six years in Ireland—we mean since the first relaxation of the Popery laws in 1779. Into what a state would the armed force of the country be thrown, what reliance could be placed upon the efficiency of the British army throughout Ireland, if each regiment were divided into Orange and Green factions, hardly restrained from butchering each other on parade, but compelled by the oaths which bound them to the societies into which they had respectively been initiated, to take opposite sides in cases of popular tumult, and so convert the ultimate instrument of public tranquility and security into an irresistible destroyer of both? It is gratifying, at least to moderate politicians, to discover, that however prevalent may have been the practice of seducing private soldiers into the ranks of Orangism, the very parties accused of it have been forced to reprobate and disavow it, not even Colonel Verner, grand functionary as he is, having ventured to say a word in extenuation of the crime of corrupting the paid protectors of the Crown and country,

With regard to the Duke of Cumberland, we do not pretend to say that any privy has been brought home against him, as to the real and highly criminal destination of the blank warrants to which he had affixed his signature. But every one will admit that his Presidency over those Orange meetings at Lord Kenyon's, where mention was made of the military men for whom certain warrants were intended, and of the fees from which soldiers should be exempted, bore at least a rather awkward appearance.

## ORANGE LODGES.

(From the Herald.)

What is the cause of the present rabid hatred and persevering malice of the O'Connellite party to the Orangemen? It cannot be doubted that it is the experience which that party has had of their devoted and inflexible adherence to Protestant principles and British connection. It is not many years since Mr. O'Connell himself courted the Orangemen of Ireland

by the most abject advances and the most fulsome flattery. His object was to wheedle them into an alliance with his anti-Saxon party for the dismemberment of the empire by the repeal of the legislative Union. Some of the adulatory expressions which he addressed to them were quoted by Colonel Verner in the debate on Tuesday night. Among other things he said, "They (the Orangemen of Ireland) were the most noble, generous, and patriotic band of men that ever existed." His acts were as expressive as his words—he pressed the Orange lily, the symbol of Orange politics, to his bosom, and drank "the pious, glorious, and immortal memory of the great and good King William," in a glass of pure Boyne water. He called on the Orangemen to "assist in destroying the connection of Ireland with the British parliament, which was the source of all their distresses." He told them that by their co-operation they might in twelve months have an Irish parliament sitting in Dublin. The Orangemen, faithful to their principles and to British connection, despised the flattery of the agitator as they had always scorned his threats. They were proof against all the charms of the tempter—they were resolved to hold fast by British connection—to flourish or to fall with the Protestant constitution of England, rather than give Mr. O'Connell an opportunity of destroying it by their instrumentality, while he satiated at the same time his revenge on the "base, bloody, and brutal Whigs" as he styled those whom he now covers all over with the slaver of his panegyric. Hence a more bitter and venomous hostility than ever on the part of the chief agitator and his party against the Orangemen, who, had they acted so as to merit the praise of their present defamers, would not have deserved so well of their country.

We should rejoice to see the day arrive when there would be no necessity for Protestants associating together in Ireland for the purpose of self-defence. But while societies dangerous to the peace of the country, hostile to the Protestant religion, and opposed to British connection, are organised in that country, Protestants must altogether disregard the law of self-preservation if they do not unite upon the defensive principle—carefully abstaining from becoming assailants, but resolved not to be assailed with impunity. In 1641 the Protestants of Ireland slept unsuspectingly while a most extensive and destructive combination of their enemies was in progress, and more than 60,000 of them, on the smallest computation, perished by midnight massacre, and but for an accidental revelation of the plot in Dublin the tragedy of Protestant extermination in Ireland would have been complete.

### THE CRISIS.

(From the Age.)

So it appears that the supplies will be stopped if the Lords do not truckle to O'Connell and the death's head and cross-bones government, so graphically depicted by Maurice Fitzgerald (whom John O'Connell will not fight) in the petition presented by young Scarlett. Will they indeed?

What the consequences of such a step would be we have on a former occasion shown. It would leave the army unpaid, the navy unpaid, the civil functionaries of state unpaid, the national obligations unpaid, the dividends unpaid, the colonial expenses unpaid—even the beautiful black job unpaid. In other words, it would produce mutiny in our fleets and armies, ensure the speedier loss of our colonies, and

break up the empire. Is a majority of the House of Commons prepared to do this? We doubt it.

We wish they would try—sincerely and from the bottom of our souls do we utter that wish. The present House of Commons has become all but intolerable, and the cup would be filled by this addition. Stop the supplies!—very well. Even a Whig ministry could not stand that—even they would be obliged to counsel a dissolution; but it would not be left to *them* to suggest that act of justice. A Tory government would be imperatively demanded by the angry voice of all that is honourable and powerful in the country. The Tories, now nearly a match for the O'Connell crew in the Commons, would by a new election, outmatch them by a powerful majority. In the present state of the registration we might expect, even as it is, a majority of a hundred; but if the feelings of the country were to be outraged by such an atrocious act as that suggested on Friday night—suggested, we admit, by the most shameless part of the house—the combined Whig, Radical, and Papist contingent would not amount to 150 in a house of 658. And well they know it.

### CORPORATION REFORM.

(From the Examiner.)

Mirabel goes into the den of thieves gallantly appointed; he is received by the bravoes with much courtesy, but soon the character of his company and his entertainment appears: one observes that his purse is unnecessary; another takes a fancy to his snuffbox; a third relieves him of his sword; a fourth proposed the amendment of exchanging suits—copper for gold lace: and after these various friendly improvements, Mirabel wears the appearance of the rogues who have stripped him. Then one treads on his toes, and another tweaks his nose, and the sufferer must submit to all patiently, for there is an overwhelming majority of bravoes against him.

Such has been the treatment of the unfortunate Municipal Reform Bill in the house of ill fame. The parallel, however, fails in this respect—that, though despoiled, Mirabel's body remained un mutilated and undamaged; but the substance of our desired measure has been so cut up and mangled that hardly a particle of the original remains. In fact, there is no identity; and this thing which is sent down is a hideous changeling. The Lords have substituted their own ill-favoured offspring for the sound, well shaped measure that was sent up to them by the Commons.

The freeman's abused privileges have been perpetuated; an insolent oligarchical qualification has been introduced limiting the class eligible to the town council to the richest sixth of the rate-payers; the licensing power, vested by the original bill in the town councils has been given back to the magistracy, whose reputation has suffered so much by the possession of it, to say the least; the existing aldermen are fixed for life in town councils, to neutralize the principle of popular election, and to taint the new system with the imbecility and corruption of the old; a further division of towns into wards has been carried, and the arrangement of the divisions has been given to the justices of the neighbouring districts, as persons, forsooth, who cannot be suspected of prejudice! The magistracy is notoriously in the main Tory, and the effect of this enactment would be to give them the power of parcelling out the boroughs according to the aristocratic influences.

## TURF INTELLIGENCE.

Amidst the turbulence of the senate, and the fierceness of political contention, as well as the general depression of the commercial community, and the agricultural interest, it is a pleasing contemplation that racing is on the increase, as if the people of this country sought a solace for their sorrows in the fascinating recreations of the race-course. The operations of the turf have become a very important business, divided, like our manufactures, into every advisable ramification: thus we have breeders, trainers and jockeys, whose united exertions have produced a degree of perfection which, in the opinion of many, bids defiance to improvement: nor must the betting circle be forgotten, whose busy proceedings give a degree of interesting animation to the scene, unattainable in any other form. However, if satisfactory excellence has been thus far obtained, it must be acknowledged that those who have undertaken to convey to the public accounts of turf affairs, through the medium of the beautiful science of writing, are utterly inadequate to the discharge of the duty, owing to their gross ignorance of the subject upon which they have unblushingly undertaken to instruct others by practical elucidation; those, therefore, who place any confidence in the "*sporting reports*" which appear in the London daily and some of the hebdomadal papers, will receive but a very vague, a very flimsy, and, indeed, a very fallacious idea of passing events, and cannot fail to experience the most miserable disappointment in their prospective anticipations.

Chester Races, which take place early in May, may be regarded as the first meeting of the season—of any consequence at least—and affords an opportunity for forming an opinion of the two-year-olds of that part of the kingdom, as well as the influence of the previous winter upon the constitutions of the candidates for turf distinction. Chester meeting is succeeded the following week by Liverpool Spring Races, when we arrive at one of the most important meetings of the season, Epsom. The Derby, the Oaks, and the Doncaster St. Leger, are the three most important stakes which are offered for contention, the last of which, though less valuable perhaps than the Derby, excites the greatest interest. The Ascot, the Liverpool, and the Goodwood Cups, form brilliant stars in the racing constellation, superior in attraction to any other stake or prize, except those already enumerated.

The decision of the Derby this year evinced the advantage to be derived from the jockey possessing a thorough knowledge of the qualities of his horse, and using them honestly. Mundig, on the Derby day, was not so good a horse as Ascot; Will Scott is inferior to several jocks as a rider; yet, by the strength and persevering disposition of the one, and the very liberal animations (whip and spurs) of the other, the prize was won. The decision of the Oaks manifested the folly of the general custom of holding a dark nag too cheaply.

Of all the disciples of frail humanity, none are more reserved than trainers; and of all the trainers with whom we ever came in contact, we never encountered one more circumspect than John Scott; he contrived to keep Mundig so much in the dark, that from the time the betting commenced on the Derby up to the period of running, nothing had been as-

certain respecting him; it is true, he figured in the betting list, but in a very humble situation, and sometimes the question might be heard at Tattersall's, *en passant*, "What's the price of Mundig?" Once or twice, when the odds were very heavy against him, those who were in the secret, the select, the very select, few—contrived to transact business upon him to some extent; the circumstance awakened curiosity, which, however, subsided as soon as the cause that had created it ceased to operate. In the meantime, Will Scott, (brother of the trainer,) had ridden the horse in his gallops, had well ascertained his quality, and hence immediately before starting, he mutteringly remarked, that he "would win the Derby if he cut Mundig to pieces."

It is very well known that Queen of Trumps won the Oaks the following day without a shake of the bridle or a lift of the hand. Tommy Lye sat upon her as steadily as possible from beginning to end; she outstripped her competitors, held all the way.

On the following Tuesday Mundig was announced as the favourite for the Doncaster St. Leger, with the Queen of Trumps occupying a position on the list three degrees lower. Ascot, the second in degree, was beaten a fortnight afterwards by Ibrahim, who did not make a remarkable figure in the race for the Derby, nor, indeed, is he so good a horse as Ascot; but, on the occasion of his success, happened to have a rider on his back. However, this made no material alteration in the betting for the St. Leger. At length, Goodwood Races came on, where Preserve (who had uniformly been a favourite for the Oaks up to the moment of starting,) proved herself a superior racer. Thus stood the case, Ascot had been beaten by Mundig, he had been beaten by Ibrahim, confessedly not a first-rate; and Mundig, although Will Scott contrived to push his nose to the winning-post three inches in advance of Ascot's muzzle, was beaten to a "stand-still;" it was a very close affair, while it was abundantly evident that two more strides would have placed Ascot in advance, consequently Mundig cannot be a first-rate horse. The matter was too obvious; Queen of Trumps took the lead on the betting list, kept it up to the 20th of August, nor can the trifling retrocession which she then experienced be accounted for upon the principles of reason and common sense.

Queen of Trumps is a very healthy filly, possessing uncommon speed, and extraordinary powers of endurance. Preserve, an acknowledged good racer, she could have distanced at Epsom, as every person must be well aware who witnessed the race for the Oaks; is it likely, therefore, that she should experience defeat at Doncaster by Mundig or Ascot, neither of whom can lay claim to any superior pretensions, and both of whom have had too much taken out of them to come fairly to the post. Queen of Trumps has never experienced greater fatigue than that which her indispensable exercise imparts.

Throughout animated nature, with very little exception, we find males more powerful than females; but, inasmuch as the latter arrive at maturity at an earlier period than the former, in our estimate of their relative strength, this circumstance should be uniformly taken into consideration. A horse does not attain maturity till he is seven years old, which is accomplished by the mare at six, if not earlier; nor

have we the least doubt that, up to five years, the filly as a racer, is stronger by comparison than the colt. If we look at two years old stakes, we shall find that they are more frequently won by fillies than colts, when the sexes contend against each other. We have frequently noticed that when a three years old (colt in particular) has been worked hard or been overmarked, he has not been able to run again for a very considerable period, generally not for the remainder of his life, at least successfully: of the truth of this position or principle, Mr. Dawson's Satan (by Lottery) is a living instance, amongst many others. And therefore, according to this doctrine, Mundig, three years old, and who experienced very great distress from his overstrained exertions at Epsom, can be scarcely expected to come to the post for the Doncaster St. Leger with a promising chance of success against such an animal as Queen of Trumps, who, in addition to her extraordinary powers, will come out as fresh as possible. Ascot has run several unsuccessful but distressing races; and, although he may derive considerable advantage from good nursing for two months, the effects of his exertions on Epsom Downs and Ascot Heath will scarcely be obliterated. Moreover, we are decidedly of opinion, that if the two colts just mentioned came to the post with every advantage of freshness and condition, Queen of Trumps would beat them with ease. However, in Turf calculations, dark horses should be duly considered: Mundig was a dark horse prior to his race for the Derby, Queen of Trumps was similarly circumstanced prior to the decision of the Oaks. In the contest for the Doncaster St. Leger, this magnificent filly, this Queen of Trumps, may be hemmed in, other untoward incidents may occur; but, if all be *on the square*, we entertain very little doubt of her success.

In the early part of the month (August) Queen of Trumps became the favourite at 7 to 4 against her; Mundig receded several points, but was placed second on the list; Ascot third. In a few days Queen of Trumps advanced a trifle; Mundig experienced a further depression, and he and Ascot might be said to exchange places on the betting list. Shortly afterwards, Preserve (whose appearance at Doncaster was not expected) came briskly into the market, and from 20 to 1 experienced such a rapid ascension as placed her fourth on the scale at 10 to 1. Since this time she has ascended several points, whilst Queen of Trumps has experienced a decline, and Mundig appears once more at the head of the list.

The following is the state of the odds on

#### THE DONCASTER ST. LEGER.

- 9 to 2 agst Mr. Bowes's Mundig.
- 5 — 1 — Mr. Mostyn's Queen of Trumps.
- 8 — 1 — Mr. Greville's Preserve.
- 8 — 1 — Lord Orford's Ascot.
- 12 — 1 — Lord Derby's Verbena.
- 15 — 1 — Mr. Richardson's Hornsea.
- 20 — 1 — Mr. Watt's Mamsel Otz.
- 20 — 1 — Mr. Johnson's Jupiter.
- 30 — 1 — Capt. Taylor's Amlerby.
- 40 — 1 — Mr. Peel's Trim.
- 40 — 1 — Mr. Houldsworth's Turban.

We consider the above list as a factitious state of the betting, as far as relates to Mundig and Queen of Trumps, as it cannot be supported on the genuine and unerring principles of physiological deduction. The owner of Mundig, whether it be Mr. Bowes or Mr. Ridsdale, may be anxious to dispose of him prior to the period fixed for the decision of the important stake in which he stands engaged; therefore, like a foreseeing salesman, may have sent friends into the market for the purpose of enhancing his price.

"There are more things in heaven and earth,  
Than are dreamt of in your philosophy."

#### TATTERSALL'S, MONDAY, AUG. 24.

The assemblage was not so numerous as the near approach of Doncaster races reasonably enough induced the anticipation; nor indeed was business transacted except to a very limited extent. A degree of suspicious indecision was the predominant feature of the meeting, owing to the mystery in which Mundig has become completely enveloped. He appeared to have a number of supporters, or rather semi-supporters, as their offers to back him were in conjunction with other candidates for the glittering prize. However, it had the effect of preventing that decided recession which we had fully anticipated; and although in defiance of the circumstance already mentioned, he sunk a point or two, yet on the close of the afternoon he stood at 4 to 1. Queen of Trumps advanced just sufficiently to place her at the top of the list. Preserve was frequently mentioned, as also Verbena, both of whom advanced in the estimation of the betting circle. We can scarcely refrain from entertaining the opinion that Mundig will not start for the Leger. At the close of the business the odds stood thus:—

#### DONCASTER ST. LEGER.

- 7 to 3 agst Mr. Mostyn's Queen of Trumps.
- 4 — 1 — Mr. Bowes's Mundig.
- 13 — 2 — Lord Orford's Ascot.
- 7 — 1 — Mr. Greville's Preserve.
- 13 — 1 — Mr. Richardson's Hornsea.
- 18 — 1 — Mr. Watt's Mamsel Otz.
- 20 — 1 — Mr. Johnson's Jupiter.
- 20 — 1 — Mr. Pottinger's Crescent.
- 25 — 1 — Mr. Golden's Brother to Hope.
- 33 — 1 — Mr. Houldsworth's Turban.

Queen of Trumps, Mundig, and Preserve were offered against the field; as also the two former accompanied by Verbena, and bets made in each case.

**GROUSE SHOOTING.**—The morning of yesterday, the 12th, was ushered in with the only heavy and continued rain which has fallen in this part of the country for many weeks. The weather being also close and hazy was an additional disadvantage to the sportsman; yet, with all those drawbacks, the result of the day's sport, so far as can be ascertained while we write, has been equal to an average of seasons. Many of the shooting grounds had been gone over before the actual owners had reached them, for it is a well-ascertained fact that some hundred brace of grouse reached this place the Highlands in the course of the early part of the week, and were forwarded to various parts of the country.—*Perthshire Courier* of the 13th.

**HYDROPHOBIA.**—It seems to be a vulgar error that dogs are more liable to become mad in warm than in cold weather. "In hot countries," observes a popular writer, "the disease is, indeed, almost unknown." On the Continent, where the disease is often caused by the bite of wolves, it occurs *oftener in winter than in summer*. Hydrophobia (in English water fret) is not caused only by the bite of a dog—as frequent instances are given from that of a fox, cat, hog, &c., but varying in the symptoms and in different degrees of violence. The poison will remain in the constitution for a considerable period of time. In one case, which occurred under Dr. Bardsley, at the Manchester Infirmary, *twelve years* had intervened! Many remedies and modes of treatment have been proposed for hydrophobia when confirmed, but there has yet been none found to answer the high expectations excited at their first appearance.

### DISSOLUTION OF PARLIAMENT.— THE AGRICULTURISTS.

TO THE EDITOR OF THE FARMER'S MAGAZINE.

“ For little office  
The hateful Commons will perform for us ;  
Except, like curs, to tear us all in pieces.”  
SHAKESPEARE.

SIR,—It seems to be a prevailing opinion, that a dissolution of parliament will occur before the end of the year. In what manner this event is to be brought about, does not appear to be quite obvious, nor do I feel that it is at all essential to my present purpose to know from what cause a new parliament may be called. The struggle between parties has at this moment but little interest for persons connected with the land ; because it is now placed beyond all doubt, that the sympathy of the Tories in the House of Commons for the distress of the agricultural community, is,—when compared with the sympathy of the Whigs for the same interest—in about the proportion that six bears to half-a-dozen. To come to this conclusion, does not, I admit, offer any very cheering prospect either to the land-owner, the occupying tenant, or to the labourer ; but at the same time I think when the fact is as notorious as that the Emperor of Russia practises the cruelty of a tyrannical despot towards the subjugated kingdom of Poland,—it is the better course at once to acknowledge the misfortune, and then set determinedly to work to endeavour to take that care of ourselves which others do not seem at all disposed to observe on our behalf.

When any subject deeply connected with the manufacturing world, is before the legislature, there is immediately a combination of that interest, carried on in various ways, and regulated by the necessity of the case, to support their cause before parliament, and it is quite astonishing to observe the strict unanimity and industry of purpose which is generally exercised on these occasions. It is true this object is much more easily accomplished in towns among the manufacturers than it is in the country, dispersed as the agricultural population is, in small villages, distant mansions, and solitary farm-houses ; and this separation is, beyond all doubt, one leading cause why this vital interest of the state, in times of distress, and on occasions of oppression, is not heard so clamorous in its demands for relief and redress, or so systematic in political pursuit, as the more gregarious part of the nation, namely, manufactures and trade. Then, as to the protection in parliament, of the landed interest, through the especial

care of the county members, let it be remembered, these representatives of the land labour under a twofold disadvantage, the first arising from a numerical inferiority in the house, and the other an inferiority of another description, to characterise which, I will copy a paragraph or two from “ Smith’s Wealth of Nations,” beginning at page 396, vol. I.—“ Merchants and master manufacturers are, in this order, the two classes of people who commonly employ the largest capitals, and who by their wealth draw to themselves the greatest share of the public consideration. As during their whole lives they have been engaged in plans and projects, they have frequently more acuteness of understanding than the greater part of country gentlemen ; as their thoughts however, are commonly exercised rather about the interest of their own particular branch of business, than about that of the society, their judgment, even when given with the greatest candour, (which it has not been upon every occasion), is much more to be depended on with regard to the former of those two objects, than with regard to the latter. *Their superiority over the country gentleman is, not so much in their knowledge of the public interest, as in their having a better knowledge of their own interest than he has of his.*”

“ It is by this superior knowledge of their own interest that they have frequently imposed upon his generosity, and persuaded him to give up both his own interest and that of the public, from a very simple but honest conviction, that their interest, and not his, was the interest of the public. The interest of the dealers, however, in any particular branch of trade or manufactures, is always in some respects different from, and even opposite to, that of the public.”

Truly, one would think from the above quotation, that Dr. Adam Smith had written his famous Inquiry into the Nature and Causes of the Wealth of Nations, after the sad experience we have had of the workings of “ Peel’s Bill ;” but as, however, we know this was not the case, we may fairly make up our minds to the fact, that the course of things is not much altered since 1775, and that subsequent events have fully justified the opinion of Adam Smith, as to the relative qualifications of self-protection and principle, possessed by the merchants, manufacturers,—including the Jews—and country gentlemen.

If we have need of the above truths being more closely brought home to our minds, we have only to take a view of the present state of manufactures and trade as compared with the present condition of the agricultural interest ; and although circum-

*stances*, independent of the legislature, may have favoured for the last few years the former interest beyond that of the latter, still the great and *substantial cause* of the present prosperity of the manufacturers is undoubtedly the result of the fostering care of the British parliament, exercised on their behalf, and which has operated to the destruction of the landed interest at the shrine of trade and commerce. I may be told that the *prosperity* of the one interest is incompatible with the *distress* of the other. Aye, so it is incompatible with such extreme distress that would drive the suffering party to open rebellion and violence; but with any distress short of this, so long as a foreign demand exists for British manufactured goods, equal to the demand of the present time, I not only deny that it is incompatible for the manufacturers to flourish when the interest of the land is depressed, but I will go much further, and assert, that this depression of the land will be one source from which the manufacturers will derive their prosperity.

During the late war, the favourite toast at all public dinners, was, "The Plough and the Loom," and at that time, and under the then existing circumstances, these interests were inseparably connected, and for this obvious reason, that the trade of the manufacturers—or the exchange perhaps would be a more appropriate term—with foreign nations, was completely paralysed, and consequently the only consumption to be depended on for their produce, was the home market; and as the greater part of the purchasers of manufactured articles derived their profit or wages from the land, it is quite clear that the plough and the loom at that time had the deepest interest each for the other. But after the conclusion of the war, another great interest was added to the above favorite toast, by the technical term of the "Sail," and then it was generally thought that these interests must rise or fall together. Now, so long as the war continued, and when the "Wooden Walls of Old England," comprehended as they then did, the whole of our shipping interest, from the line-of-battle ship to the mere ferry skiff, because every thing that could float was employed in the common defence from the common enemy,—then, indeed, the above interests were inseparably connected, and stood precisely in this situation. The manufacturing supplied the agricultural interest with the various necessities and luxuries of life; the agriculture of England was the only means of affording bread and meat to the manufacturers, and the wooden walls defended both interests from the invasion of a foreign enemy. But no sooner was the war concluded, and trade and commerce had again revived with foreign nations, and the "wooden walls" had lost their warlike name for the more pacific and commercial term of the "sail," than these great interests had immediately different views; the "loom" and the "sail" hanging together, leaving the "plough" in the lurch. The two former interests demanded cheap bread, the latter interest insisted on the impossibility of bread being cheap on account of the heavy charges the expenses of the war had entailed on the land in the shape of taxes. But no, the "loom" and the "sail" were inexorable, and by unity of purpose and industrious representatives in the House of Commons, cheap bread has been secured to them.

I have ventured on the above lengthened digression from the subject with which I commenced this letter, namely, the probable dissolution of the present parliament, in order to show the fallacy of the assertion that the views and interest, during

the time of profound peace, of the plough, the loom, and the sail are inseparably connected, and consequently that we who derive our support from the agriculture of the country ought to send men to parliament to represent our interests, who are determined friends to the land, and staunch supporters of all those measures which are generally believed to influence the condition of the agricultural part of the community. In ordinary times it may be well enough to take a general and not a confined view of the probable nature of the votes any candidate for the suffrages of the electors of a county might give, provided he was returned to parliament. But these are not times in which we can spare one tittle either of our interest or our cares on any matter but those causes which have directly the effect of bringing about our present unnatural distress, and consequently it behoves us to look for men as our representatives who will vote for a *revision of our present anomalous monetary system, and for the total repeal of the malt tax*. These two great questions are, I believe, mainly instrumental to our present extreme distress, for with our restricted circulating medium the prices of the produce of the land can never, for any length of time together, be sufficiently high to keep the landed proprietor from the gripe of the Jews, or the yeoman and occupying tenant from ruin, unless some source can be devised for raising the money necessary to pay the interest of the national debt by other means than the present system of taxation, and the effect of the malt tax ever has been—and ever will continue to be so long as it exists as a tax—most injurious to the morals and industry of the agricultural labourer. Poor law amendment bills, municipal reform bills, tithe commutation bills, may occupy the attention of the country and the time of parliament session after session, but from these or any other legislative measures the cloud which hangs over the landed interest can never be dispelled so long as the effect of "Peel's Bill" be allowed to cramp the resources and enterprise of the cultivators of the soil, or the prohibitory tax on malt to degrade the pursuits and to weaken the physical power of that invaluable portion of the community, who literally perform that part of the sentence of our Maker to our first parents, as one effect of the fall of man, "in the sweat of thy face thou shalt eat bread." Let us not then continue to be cajoled either by Whig or Tory; let us not be deceived by the representations of *exporting manufacturers or monied Israelites*, who tell us that their interest is our welfare; and above all, let us not be led astray from our purpose because Sir Robert Peel says that a relaxation of our currency and a repeal of the malt tax would lead to individual ruin and national dishonour.

That Sir Robert Peel is the ablest and most sagacious statesman of the present day, does not, I think, admit of a doubt; but after all the right honourable baronet is only mortal, and as such is liable to all the errors and *temptations* that human nature is heir to; and his liability to error (*to use the most charitable term*) is at least fully exemplified by the ruinous consequences of his bill of 1819, and his subsequent fallacies in defence of that measure, together with the sophistry and specious art of reasoning embodied in his speech of the late session on the occasion of the Marquis of Chandos's motion for the repeal of the malt tax. Now I know that powerful speech had the effect of reducing the number of the friends of this measure, and I admit that it was almost impossible for any man to rise from a superficial

reading of this effort of Sir Robert Peel's, without its having made an impression in favour of the tenour of the arguments it contained; but if the reader gave himself the trouble to try the views and assertions (of the right honourable baronet, contained in that speech) by the test of actual results, those views and assertions would be found to be miserably mistaken. As the Song of the Sirens was fatally irresistible to the mariners of their enchanted coast, so do the arguments of this clever man appear to be irresistible to the majority of the House of Commons. I mean his arguments on the currency and the malt tax. Let us then, like old Ulysses, endeavour to provide for this danger, not by stopping the ears of our representatives in parliament, but by sending such men there who are prepared, through good report and through evil report, to vote for these measures. It is the great object of ambitious men contending for power, to divert the attention of the agricultural part of the kingdom from these two great questions, and to endeavour to engage their interest and feelings on subjects which may be important enough to the inhabitants of corporate towns, or to the payers and receivers of Irish tithe, but which in fact are in no degree essential to the prosperity of the British farmers. Let us not then, I repeat, be cajoled in this way; let us vote whenever we have an opportunity to do so for men who will support, "tooth and nail," a revision of the money system of the country, and a repeal of the malt tax; and if we secure these promises from a candidate, let us vote for him, be he Tory or Whig (although I confess I would much prefer being represented in these feelings by a Conservative member), still as it is impossible to have everything just as we may happen to wish for it, let us be satisfied at the present moment with securing the above objects, and these having been once attained, we shall have room to suit our "political taste" in other respects for the future.

At Findon sheep fair, on the 14th inst, the effect of the dry summer had a natural influence on the prices of sheep, and although the number penned was certainly less than an average, one-half of the sheep were driven back unsold. Ewes fell short of last year's prices from 6s. to 8s. per head, and lambs from 2s. to 4s. a-head. In the wool-trade very little was doing; indeed, I only heard of one sale being effected, and that was a considerable lot at 45s. per tod of 32lb. Flock owners were inquiring for keep for their ewe lambs during the winter, but very few persons appeared to be inclined to make an engagement of this nature.

I am, Sir,

Your obedient and very humble servant,  
 AGRICULTUROR.

Sussex, Sept. 18, 1835.

## No. II.

### AGRICULTURAL DISTRESS.

TO THE BRITISH FARMERS.

Brother Farmers,—

The late Mr. Henry Hunt, once speaking in reference to the Bath and West of England Agricultural Society, some of the members of which had given him affront, said that it was composed of "a set of long-headed landlords and noodle-headed parsons met together to diddle a set of thick-headed farmers out of their money." In this sentiment, in reference to agricultural societies, I by no means agree, considering them as I do not only necessary but absolutely requisite. How far the epithets applied to the landlords and par-

sons are rightly applied, I shall not stop to inquire, but thus much I do know, that it were impossible for any one who was not acquainted with the peculiar situation in which you are placed, to come to any other conclusion, than that you are a most stupid, thick-headed, sluggish, and apathetic race of men, fit only to slave on ploddingly for the benefit of your task-masters, the landlords. Borne down for years by the pressure of taxation, from which other classes have been exempt; deluded, from time to time, by false promises, made the tools of cunning political speculators who have sought and succeeded in aggrandizing themselves at your expense; you are seemingly as unprepared and disinclined to unite as if your sufferings were of yesterday. Your conduct as a body is most revolting to my feelings, and were it not that I still entertain a hope that you will arouse to a sense of your degradation, I would withdraw myself from your ranks, and blot out from my recollection that I had spent the morning of my days amongst you, and one of you. There is not a man amongst you who cannot do something in aid of the cause of agriculture. Those whose avocations or localities preclude them from attending local or central agricultural meetings, may contribute a trifle towards the expense of others who can sacrifice their time and labour. Limit your consumption as much as possible to the produce of your farms, screw down wages and rates to the lowest possible pitch, retaliate upon your hard-hearted landlords who would drain the last shilling from your pockets, by expending nothing upon the land which can possibly be avoided, and if you cannot, as is now the only certain method of obtaining speedy redress, meet in tumultuous masses and overaw the government, you may by steady perseverance in the course I recommend, prove, not only to your landlords by whom you have been shamefully neglected, but also to the free traders, the political economists, and all who desire to annihilate you, that your prosperity is absolutely essential to their existence and well-being.

A SUFFERING TENANT FARMER  
 Of 35 years Experience.

### THE LABOURERS OF ENGLAND AND HOLSTEIN COMPARED.

TO THE EDITOR OF THE FARMER'S MAGAZINE.

SIR,—When I took the liberty to address you for the first time in June last, I, as a foreigner, having no manner of connexion, nor any interest whatever in anything relating to England, did so for no other purpose, than to throw out some hints, which might lead to rouse the attention of those interested in the welfare of your agriculturists; and pursuing the same object, I hazard another letter, treating the matter on the basis once laid down, adding at the same time a few words on the condition of the labourers here, in order that a comparison may be made with the condition of those in England, which may perhaps produce some endeavours to improve it, in a manner suited to the localities. And that this must be done, no one I hope will deny.

Examining the subject before us, in the most simple and plain way, it will be clearly perceived, that the expenses of the farmer exceed the value of the produce of his land; consequently the one must be brought to balance the other, as without such balance, his ruin is inevitable. This is the plain fact, and the first question now is, what remedy is to be applied against this evil? In searching after this remedy, we will soon discover that either the prices of corn must be raised, or the expenses of producing it diminished; but as the former cannot be effected without employing artificial means, which in the course of their operation must prove prejudicial to the com-

munity at large, as we have the proof before us, there only remains the latter; and the next question is, how is that to be performed?

In my first letter I said, that the rents must first of all be reduced, and I believe to have shown that they are in intimate connexion with the taxes, &c. The one is the natural consequence of the other, and unless they are made to agree, all hopes of lessening the distress of the cultivator must be abandoned. This will be best illustrated by referring to one of your own writers, Soame Jenyns, who wrote some thirty or forty years ago; and what he said at *that* period, is fully applicable to the present, and bears in point on the subject before us.

"Every new tax, he says, does not only affect the price of the commodity on which it is laid, but that of all others, whether taxed, or not, and with which at first sight, it seems to have no manner of connexion. Thus, for instance, a tax on candles must raise the price of a coat, because out of this, all the taxes on the candles of the woolcomber, weaver, &c., must be paid. A duty on ale, must raise the price of shoes, because from them all the taxes upon ale drank by the tanner, leather dresser, and shoemaker must be refunded. No tax is immediately laid upon corn; but the price of it must necessarily be advanced, because out of that, all the innumerable taxes paid by the farmer on windows, soap, candles, malt, hops, leather, salt, and a thousand others, must be repaid, so that corn is as effectually taxed as if a duty by the bushel had been primarily laid upon it."

These are truths which cannot be contradicted, and whatever arguments should be brought forward to disprove them, would only turn out to be so many sophistries, belied by the facts.

That the price paid for labour, is higher than it should be, is evident, otherwise the Irish would not come over to England to work for what will not satisfy, nor can satisfy an English labourer, who claims a greater share of comforts than an Irishman does, but this I suppose, was not the case in former times when England exported corn, because then, there must have been more equality in the price of labour all over Europe, otherwise no corn could have been exported from England to other countries. If therefore this be admitted, and I see no reason why it should not, it is incumbent to alter this anomaly, first by introducing such a state of things in Ireland, that the industrious labourer may find work at home, and secondly by mending the *domestic* condition of the English labourer, so as to enable him to work for less than what he now earns; and to live notwithstanding with more comfort than he now does. This would not only attach him more to his family, but would at the same time have the greatest influence on his morals.

I shall not extend my reasoning to the first of these points, as not belonging to my province, but confine myself to the last, saying a few words only on the condition of our labourers here, in order to prove that our system, if introduced in England, with the necessary modifications of course, would be followed by the most beneficial consequences, to the land owner, to the farmer, to the labourer, and to the population of the country in general.

There are here in Holstein for instance, two kinds of day labourers, viz: Those living in buildings or cottages on the estates, or in villages belonging thereto, and forming a part of them; and those living in villages *not* belonging to estates, where they find work with the peasants, who own the lands around them, and on such estates as lie nearest. Some of the labourers living in villages have often a cottage of their own, and some land which they cultivate; others

live in cottages belonging to peasants, for which they pay a small rent, and in that case, they also rent a small plot of ground on which they grow rye, buckwheat, and potatoes. The prices generally paid for labour hereabouts is as follows. From Easter to 24th June 12d of our money, answering to about 10½d sterling; from this to 30th September (harvest and seeding period) 14d or 12d sterling; again 10½d sterling to 14th November, and from that to Easter 10d, or 8½d sterling, which calculating the working days all the year round to 300 days, averages at about 12d here, or 10½d sterling per day. Women, when employed, generally earn 8d, or about 7d sterling, and 10½d sterling when assisting in reaping. Such as live in habitations on the estate, live either rent free and work in such a case for about 2d less per day, or they pay a moderate rent and get the usual wages, but in both cases the landowner, or the farmer of the estate, assigns to each of them about one-quarter or one-third of an English acre of land to grow his corn and potatoes, allowing them besides to dig a certain quantity of turf for fuel. Labourers of this description usually have a cow of their own, which is fed in the pastures together with the cattle belonging to the estate during the summer, and in the stall during the winter, which expense to the farmer is in some degree compensated by his keeping the dung, whilst the labourers are enabled to manure their land by what proceeds from a pig which they fatten for their provision, having at the same time a small garden for raising vegetables, and a few hens for eggs. On most of the large estates in the interior regular contracts are made with the labourers for one year, beginning the 1st of May and ending 30th April which are renewed, altered, or cancelled three months before their expiration according as the parties may agree. Thrashing is never or very rarely paid for in money, but in kind, and those employed at it get from 1-12th to 1-17th (which varies in the different districts) of what they thrash and winnow. By the whole of this system, which agrees with the suggestions your Lisbon correspondent F. C., in your last Monthly Reporter, No. 13, the day labourer here eats his bread, this greatest necessary of life, at the price of his work in his leisure hours, he has his milk, eggs, vegetables, and winter provision for almost nothing, he is sure of his daily work, and is enabled to maintain himself and family free from want and care.

I cannot conclude this letter without saying something on the education of the children of the country try people in Holstein, although I cannot see the benefit that may be derived from it in England, where so great a value is laid on individual liberty, that to sacrifice a small portion of it for the common weal, is repugnant to almost every one. Every village in this country has a school, the master of which has been hitherto, and in many places is still, as miserable a teacher as can possibly be imagined. This has undergone a very material, and at the same time, a very beneficial alteration, for by an imperial order of the King of Denmark, every village community in which the school gets into such a decayed state, that a new one must be built, is obliged to build one of bricks, with good rooms for the teacher to live in, and the schoolroom large enough to contain all the children in the village capable of receiving instruction, which is on the Bell or Lancasterian system. The old teacher must retire on a pension, and a new one is appointed, who has been educated for such a purpose in one of the Royal seminaries. The village people are *obliged* to send their children to school during the winter, (allowing the parents their service during the summer, (where they are instructed in

religion, reading, writing, and arithmetic, and some who show capacity, even in geography, &c. It is astonishing to behold what proficiency some of them make in a short time, and on the whole it cannot be denied, that a system like this must tend considerably to improve the morals of the people. Lord Brougham, (leaving aside his political opinions, with which I have nothing to do) in pressing the necessity of a better system of education for the common people of England, highly deserves the support of his contemporaries to carry his plans into execution, and their warmest thanks for his benevolence.—I remain, Sir, yours, very obediently,

H. De JONGH.

Schenefeld, Duchy of Holstein,  
Aug. 24, 1835.

No. IV.

## PRODUCE OF THE WHEAT CROP.

TO THE EDITOR OF THE FARMER'S MAGAZINE.

Sir,—Mr. Thomas Lindsell, of this place, has a farm at Needingworth, on which this year grew 12a. of Wheat, which previous to the Wednesday, and two following days' rain in June, promised at least forty bushels to the acre. The crop became prostrate and blighted. He has machined it, and the yield is only twenty-two bushels an acre, weighing 18 stone, but I don't know if with or without the sack; but I rather think with the sack. The colour and thinness is bad beyond any thing, apparently only fit for pigs. Had it been a stand-up crop, he would have machined it out in about 1½ day; it took him nearly four good days.

I farm in the same parish, but the last two years have avoided sowing much Wheat—sowing Clover, Tares, &c., wherever I could; so that last year I had only about 125a. of Wheat, instead of 200a., and this on all my worst land; some, only, owing to drought, came up wretchedly, not more than 12 bushels an acre, although dibbled twice over; grass got into it. Other grounds 30 bushels an acre, averaging, I expect, on the 125a., about 26 bushels an acre; none of it thrashed yet. The three days' rain did me good to the extent, I believe, of five bushels an acre, mine being all a stand-up crop, except about five acres, which was much lodged; the wire-worm also injured about 16a., to the loss of, I think, about 13 bushels an acre. Had it not been for that rain, the greater part of my Wheat would have been mouse-eared; the weight promises to be good, also the quality; Millers' Wheat so much so, that I think I shall keep my own, and buy thin Fen Wheat for seed.

We shall not know much about the Fen yield for a month, as I should think all their Wheats are not even carted yet; they are full of straw, I expect, but thin and blighted.

Smut is a good deal complained of. Potatoes plenty to a root, but very small, and some now ripe.

As I think these times can't continue, consequently one year nearer better prices, I shall this year clap on and sow every acre I can, breaking up one and two-year old Clover leys. I am a holder of three years' Wheat, and a precious muddle I find myself in. None of us at present know whether to sell or hold; what I have harvested this year I intend to sell in the old way of weekly quantities.

Thrashing is not general with us at present. One of my neighbours, a very slovenly farmer, machined out 19a. of Wheat, and only got about 12½ bushels to the acre; his rent 2l. an acre. But

here was decided bad management. The same farm is now let at 24s an acre the first three years, 34s. the next eight years, and 40s. the last three, if Wheat averages 8s. a bushel. Landlord repairs, finds slates, &c., and all tiles for draining.

The new tenant, Mr. Manning, is *betting* that on another farm he grows 56 bushels of Barley an acre, and *thinks* he shall have 64. He has sold part Chevalier at 3s. 6d. a bushel.

No Red Clover left for seed this year in our county. I have 130a. total failure. No bulb to our Turnips. Coleseed only just now peeping. Tares at present yield about ten bushels an acre, very small and hard. Beans I think with us will average about 22 bushels an acre, so many were lost in the field. Straw short. Oats a good crop. Peas a very fair crop; good; well hung.

Mr. Wiles, of Pedley, had a Clover-stack fired last Monday; no further damage. Several have been served so by being over-cunning.

Yours obediently,  
A SUBSCRIBER.

Burleigh Hill, near St. Ives, Hunting-  
donshire, 11th Sept., 1835.

## FEEES OF OFFICE.

TO THE EDITOR OF THE FARMER'S MAGAZINE.

Sir,—As the burdens pressing upon the middle classes of society are exciting attention, I was glad to observe you have began examining into one, which has long needed enquiry and explanation, I mean the county rates. Our county is large and contains a vast number of parishes, and if all contribute in equal proportions, the sum must be very considerable. Our own parish pays annually about 50l. Another not small charge upon parishes, consists of the fees required upon delivering in returns, passing accounts, or taking any office. Last week the overseers paid 3s 6d each upon giving in the return of pauper lunatics or idiots. The fee when surveyors are admitted, including a paper of instructions, is 6s 6d each. If any of your correspondents can give us information whether we are only paying according to custom, we must then wait in hope that in time due regard will be had to those who pay tribute.

As this is the time for making out the jury lists, allow me to ask whether a gentleman living upon and occupying a farm at a rent of 300l or 400l per annum, though he has not fifteen windows in his house or is assessed 20l inhabited house duty, is not liable to serve, and ought to be returned in the list.

I am, sir, Your constant reader,  
Sept. 1. In-ESSEX.

## ON THE CULTIVATION OF POTATOES.

TO THE EDITOR OF THE FARMER'S MAGAZINE.

Sir,—I apprehend that the long rigmarole of your correspondent T. B. J., on "THE CULTIVATION OF THE POTATOE IN LANCASHIRE WITH PHYSIOLOGICAL AND ELUCIDATORY OBSERVATIONS," is far too "elaborate" an "excogitation," for the "illiterate farmers of Lancashire" to derive any material benefit therefrom, notwithstanding, some of them have the penetration

to discover that he has been soaring out of his *own proper element*, in treating upon this subject, and that they can glean more really useful information through the medium of the "learned Thebans" than from his "scientific illustration."

With respect to the *failure* of the potato crop, which has caused such a great sensation during the last three seasons, so far from being confined to the county of Lancaster, it has been experienced very generally throughout the whole kingdom; and, so far from having occurred only in hard-cropped land, it frequently proved more extensive in good fields that had not been ploughed for several years previously, *especially when well manured*, than in garden or other repeatedly worked soil; moreover, potatoes were found to be defective previous to being cut and planted, therefore the farmers had good and sufficient reason to blame the seed. I am disposed to admit that the crops of fresh broken-up land are better, in many respects,—and especially for seed—than those of light soil that has been hard ploughed, and thus rendered somewhat artificial; nevertheless, I am aware that the seed used has not generally grown better in the former than in the latter.

That potatoes have latterly been exceedingly tender and defective, experience sufficiently testifies; consequently, it is highly expedient that the *cause* thereof be correctly ascertained and set forth; and I decidedly agree with those Essayists\*, who attribute the injury to the extreme mildness of the recent winters, which created excessive fermentation among the potatoes, when stored or covered up in heaps, thus inducing premature growth, and eventually the defect or disease—a brown rot—which was so general, but usually prevailed to a greater extent in those crops which had been dug too soon, and then were hastily covered up in large heaps. Hence, there was considerable loss, in many stocks, before they were used or sold off; and the seed proved so tickle, when planted, that, unless the state of the land and of the weather were sufficiently favourable to produce rapid growth, the seed frequently rotted before the sprouts could take hold of the ground; the fermentation of the manure having, in many cases, destroyed the cut-sets planted in contact with it, whilst whole tubers were seldom known to fail, if sown when planted. Besides, it is well known that where apples or turnips, &c. &c., have been stored or put together, in even small heaps, for the purpose of being kept awhile, they latterly evinced an unusual proneness to decay, and had to be made off at an earlier period than was customary a few years ago.

I think it appears evident, then, that the injury proceeded from the stocks having been overheated during winter; consequently, it behoves all agriculturists to guard against the recurrence of similar seasons, as far as practicable, by resorting to such approved methods of storing their crops as may appear best calculated to keep them uninfluenced by the warmth of the atmosphere; if, however, this cannot be accomplished so effectually as to check vegetation until the proper season of the year for planting, it is unquestionably expedient to plant the tubers whole, in all cases where the manure has not been previously incorporated with the soil. ## REMARKS ON A PAMPHLET, "CORN LAWS AMENDED,"

BY J. DOYD, R. C.

TO THE EDITOR OF THE FARMER'S MAGAZINE.

Sir,—A pamphlet having lately appeared before

the public from the pen of a Mr. Doyd, entitled "THE CORN LAWS AMENDED," and having been for many years connected with Mark Lane, the subject was one, which naturally excited my curiosity, and I had hoped to have found some practical suggestions which might have merited the attention of the Government; but I have been, I confess, much disappointed in the perusal. The author commences by stating that he submits his scheme of "*Amended Corn Laws*" to the honourable members of the two houses of parliament, and to the *most intelligent* of the electors, as the basis of a convention between the owners and occupiers of land, and the consumers of its produce. He aims to reconcile the differences of opinion which exists among them, whether upon the operation particularly of the last act of July, 1828, or upon any system of corn laws in general; and also to establish in both parties a conviction of the existing laws being capable of such modification, as to lead, as well to the lawful insurance of temporary evils—for any restrictions, however necessary, upon international commerce, are evils—as to certain conclusions preparatory to, instead of their immediate repeal, at the most suitable opportunity. Selecting the moment of peace and plenty as favourable to his views of treating this subject, the author has embodied them into the form of an *additional act* to amend the act of 1828, which being placed in juxta-position, it will appear from their comparison, that the intended change effected is, the *substitution of a new scale of suitable duties* in lieu of the present, retaining the working of the general average prices. The few clauses introduced of *matter* beyond such new scale, consist merely of *additions*, by way of amendments, in the present or any other corn laws, so as to render them more effective as a whole.

The motto adopted is, "In times of abundance, be mindful of future wants." First I will meet the author on the *vantage ground* of his own motto.

It is admitted by Mr. Doyd, that on an average of years we want some foreign wheat; as he states in page 10, we imported and paid an average duty of 6s 8d per quarter on about five million quarters, from July 1828 to July 1834; but Mr. Doyd seems not to be aware that a very inconsiderable proportion of these five million quarters was entered in 1833 or 1834, which throws the five millions over a space of four years, being one and one-fourth million per year; though I believe I had better say our actual wants were one million a *year only* in that period, for it is now very evident, we did not want the last million of the five, because the good crop of 1832 followed closely on the import of the last million.

Now, with all the enclosure bills and high prices which his table shows for thirty years, (and he might have gone on to forty years), we have been importing foreign wheat, I think, with only the exception of now and then, a year or two, when we had fine crops; until lately Providence has blessed us with four superabundant harvests, and hence low prices have and must prevail.

As there is no precedent on record for four successive years of over-abundance, may we not fairly expect to have a bad crop in the natural course of seasons, and then, *as before*, we shall want foreign aid. This latter position, the author does not deny, but my object is to shew that his "*Corn Laws amended*" are not deserving of the title; but may, and some day will, make "*scarcity more scarce*." But I need not trouble myself about his theoretical principles, for sure I am that the first time we had a bad harvest, his system would be annihilated by an

order in council. But I wish to point out the injustice of his propositions : first, to the merchant, as an importer ; and next, to the public and farmers, or say the landed interest. First, the merchant :—Mr. Doyd proposes to force out the present stock of bonded wheat at 20s per quarter duty. Observe, the wheat is now not wanted ; so the agriculturist is to have about one million quarters of wheat and flour let loose upon him, to make his ruinously low prices still more ruinous ; but to the merchant the effect would be worse, for he proposes to force him to pay a further 20s on that which is already not worth the rent, exclusive of the original cost and freight, and so preclude him from even the chance of freeing himself, if next harvest should be deficient, at the same time, and cutting off the little chance of export, if any should arise. Now this is rather too bad, both for the merchant and farmers, besides a flagrant breach of the laws under which both merchants and farmers have made their arrangements since 1823.

I will give Mr. Doyd credit for not having seen the thing in the right light, and I dare say he thought it a boon to the merchants, and perhaps to the farmers ; but I think he will not now entertain the same opinion.

We will next review that part of his plan where he wishes to compel importers to pay 20s. duty on their future importations, if they happened to be obliged to keep their wheat 24 months.

It is well known, that even the present corn laws prevent import, unless the merchant thinks he sees that *he may* get a very large profit by the chapter of accidents to crops. Therefore does the author think, that under his *ultra anti-free-trade law* he would never induce the import of a single bushel.—Certainly not ; or his law might so operate, and very likely very soon, that we might find the yield of a crop bad at the very time when all the corn growing in every part of Europe was frozen up ; besides he totally overlooks the important fact, that he would force capital out of the country to be employed in warehousing corn on the continent, where no twenty-four months law existed ; and I can conceive it possible (without any very great stretch of the imagination), that such a place as Calais might become the warehousing depot for corn for all Europe, instead of our own ports having this business, which his twenty-four months' law will never get us, but which benefit I trust we shall eventually derive, under what may be really deemed, an amended state of the Corn Laws.

Having, I think, exhibited what the effect of Mr. Doyd's plan would be on the merchant, and above all on the people, as bread-eaters, by shewing that if we wanted wheat at a critical time of the year, we could not get it, and the consequent high price that must exist until we could.

Now, as regards the agriculturists, and the injustice to them :—If the present or any Corn Laws are justifiable, why does Mr. D. propose to let in all the foreign wheat at a duty of 8s., when the averages reach 55s., the present law, fixing the duty at 31s. 8d., when under similar rates ? Therefore, if the present Corn Laws approximate even towards equity in favour of the farmers and landlords, then Mr. Doyd's plan must be very far distant from justice.

Mr. Doyd makes another severe thrust at the people, which I really believe he does not himself intend ; namely, he proposes that all the foreign wheat when sold, shall be taken in and form part of the quantity from which the averages are made up. Mr. D. perhaps did not see that this would keep the average many shillings lower at times of need, than it

otherwise would be, and so injure the cause I suppose he is advocating, namely, the interest of the many, against the few.

Having (as I presume) proved that Mr. D.'s plan cannot succeed, it may be asked, what better plan than his or the present law I would substitute, and I answer thus :—That bread is cheap enough at present is generally admitted, and therefore, we do not now need any alteration that should further depress the raw material. I am also of opinion, that any corn law restrictions are bad, and will the first time we have a bad crop, be blown to atoms by the present reform House of Commons.

Therefore I propose to meet that evil, if evil it would be, by altering our present sliding scale of averages and duty ; thus take the scale and slide the average of 60s down to where 70s now is, and let all the intermediate rates follow. Then instead of a duty of 26s 8d, when the average was at 60s as now, the duty would then be only 10s 8d ; and further, if this should not be thought enough in favour of the people, then slide the scale down 1s each year, so that in ten year's the duty would be nearly nominal.

I take leave at once to say, that our government should not look to a duty on the bread of the people as a source of revenue. "That is odious."

Therefore Corn Laws resolve themselves into a question of landlords, versus people ; and I really mean *landlords* and not *farmers*.

I feel reluctant to say, as some do, that Corn Laws should be totally abolished forthwith, therefore I propose easing them down gently—all violence I hold to be bad, even in cutting away inproprieties like this has become : but I do not see why the article of land, which is the commodity of one class of the community, should have laws to enhance or keep up its value, when other owners of property, merchants, traders &c., have no restrictive and individual laws to prop up the value of their property.

It may be said, Ireland is increasing by rapid strides in her cultivation ; so the country is, but the population in the three kingdoms is growing in an equal proportion, and if it should so happen, that the Irish people should happily ever be able to live better than our pigs, they will want all their Wheat, though they may and will be able to spare us their Oats.

In short, I am still of opinion we shall on an average of years, want some foreign aid in Corn ; at all events we ought to ameliorate our Corn Laws so as to get it cheaply when we do, and then we may safely leave the rest to *Providence*, but not to *landlords*.

With every good feeling towards Mr. Doyd, as to his beneficial intentions, crude and undigested as they are,—I am, Mr. Editor,

Yours and his humble servant,  
Wm. RUSTON.

NOVEL VETERINARY CASE.—A horse, the property of Mr. J. Gaskin, baker, of North-street, Leeds, died rather suddenly, and the owner determined on having it opened. Mr. Knapman performed the operation, and on making an incision into the bladder, discovered that there was some hard substance within ; and, on further examination, he found two very large calculi with a smooth surface ; one of them weighs 1 lb 13 oz ; and the other 1 lb 9 oz. A number of Medical Gentlemen and Veterinary Surgeons have examined them, which are rather of an oval figure ; and it is believed to be the first instance in which two substances of this nature were ever found in such a situation at one time.

## ON THE APPLICATION OF THE POINTS BY WHICH LIVE-STOCK ARE JUDGED, TO SHORT-HORNS.

By MR. JAMES DICKSON, CATTLE-DEALER,  
EDINBURGH.

(From the Quarterly Journal of Agriculture.)

Having, in my former paper (vol. v. p. 159), enumerated the *points* and form by which the value of an ox of any breed ought to be ascertained, let us now apply them to the prevailing breeds of cattle, that we may thereby discover which is the most valuable one existing; and, after having ascertained that by comparison, we will then be prepared to consider whether the less valuable breeds might not be improved by intermixture with the most valuable, or, at least, whether such attempt at crossing would be beneficial to the country.

Before proceeding with this interesting investigation, I may remark, that the points and form recommended for general application are neither imaginary nor arbitrary; on the contrary, they have been discovered and established by long experience patiently acquired, and they have now received the general sanction of competent judges; in short, they form the rule of judgment for our best practical judges of cattle. It may have been observed, however, that I have hitherto applied the rule only to *oxen*, and it may therefore be very reasonably demanded whether it applies as well to heifers, bulls, and cows? To this I answer, that it applies to every age, sex, and condition of cattle, and that if it did not, it could not be maintained and recommended as a *general* rule; but in its application to bulls and cows there is a slight deviation occasioned by sexual development. In the bull, age produces an enlargement of the muscles of the neck, and a fulness of the gristle, and a consequent dependence under the brisket; there are marks of *virility*, beside others, which cannot exist in the ox; and in the cow, age produces a thinness in the buttocks and an enlargement of the abdomen, and a consequent depression of the loins; these being marks of *calf-bearing*, which cannot exist in the heifer. In all other respects in regard to general form, points, quality, and good breeding, the rule applies as strictly to the bull, the cow, and the heifer, as the ox.

Of the various prevailing breeds of cattle in Scotland which I shall enumerate and apply the rule of judgment to, I shall begin with the *short-horns*.

When we survey the frame of a short-horn ox, we have a straight level back from behind the horns to the top of the tail, full buttocks, and a projecting brisket; we have, in short, the rectangular form, as represented in a side view by this Fig. 1;

Fig. 1.

We have also the level loin across the hook bones, and the level top of the shoulder across the ox, and perpendicular lines down the hind and fore legs on both sides, these constituting the square form when the ox is viewed before and behind, as represented in Fig 2 and 3; and we have

Fig. 2.

Fig. 3.

straight parallel lines from the sides of the shoulders along the outmost points of the ribs to the sides of the hind quarters, and we have these lines connected at their ends by others of shorter and equal length, across the end of the rump and the top of the shoulder, thus constituting the rectangular form of the ox when viewed from above down upon the back, as represented by Fig. 4. We have in this manner the form of the short-

Fig. 4.

horn ox and heifer in perfect accordance with the diagrams of the rule.

Further, I should be inclined to assert, although I have not directed my attention to the fact sufficiently to be able to prove the assertion from examples, that the carcass of a full-fed symmetrical short-horn ox, included within the rectangle, is in length double its depth, and its depth equal to its breadth. Hence, Figs. 2 and 3 are squares, and Figs. 1 and 4 each two similar squares, placed in juxtaposition. The short-horn bull deviates from the rule in a rising of the neck, a dependence under the brisket, and a fulness of the neck vein; the cow only a little from the ox or heifer in a thinness in the buttocks, and besides this, when aged, in an enlargement of the belly, and mostly, though not always, in a hollowness in the loins. The *form*, therefore, of the short-horn breed is perfect according to the rule.

In its *points*, that for quantity and well laid on beef, the short-horn ox is quite full in every valuable part, such as along the back, including the fore ribs, the sirloins and rumps, in the runners, flanks, buttocks, and twist, and in the neck and brisket as inferior parts. In regard to quality of beef, the fat bears a due and even preponderating proportion to the lean, the fibres of which are fine and well mixed, and even marbled with fat, and

abundantly juicy. The fine, thin, clean bone of the legs and head, with the soft mellow touch of the skin, and the benign aspect of the eye, indicate in a remarkable degree the disposition to fatten; while the uniform colours of the skin, red or white, or both, commixed in various degrees,—bare cream-coloured skin on the nose and around the eyes, and fine tapering white or light-coloured horns,—mark distinctly the purity of the blood. These points of blood and quality and quantity of beef, apply equally to the bull, the cow, and the heifer, as to the ox. Combining all these properties of points and form, we shall find that the short-horn breed illustrates, in a very satisfactory manner, the application of the general rule which has been explained. On account of its valuable properties, this breed demands further illustration.

The external appearance of the short-horn breed is irresistibly attractive. The exquisitely symmetrical form of the body in every position, bedecked with a skin of the richest hues of red and the richest white, approaching to cream, or both colours, so arranged or commixed as to form a beautiful fleck or delicate roan, and possessed of the mellowest touch,—supported on small clean limbs, shewing, like those of the race-horse and the greyhound, the union of strength with fineness; and ornamented with a small lengthy tapering head, neatly set on a broad firm deep neck, and furnished with a small muzzle, wide nostrils, prominent “mildly beaming” eyes, thin large veiny ears set near the crown of the head, and protected in front with semi-circularly bent, white or brownish-coloured short (hence the name), smooth, pointed horns;—all these several parts combine to form a symmetrical harmony, which has never been surpassed in beauty and sweetness by any other species of the domesticated ox.

Enthusiastic as this language may be considered when applied to the external beauty of cattle, it is not more so than the beauty of cattle is entitled to; for when it is considered that symmetry of form generally accompanies mellowness of touch in the skin, and that both constitute the true index to a disposition to fatten, the most *useful* property of all, beauty of external appearance is too valuable a criterion to be overlooked. Fortunately, indeed, beauty cannot be overlooked in cattle, for, even were it useless, it is so irresistibly engaging, that the judgment of a stoic would be biassed in its favour. To my taste, nothing can be so attractive a spectacle of the kind as a show of fine bred short-horns in high condition, such as are to be seen at Dunse June Fair, Alnwick First Fair, or the monthly markets at Kelso and Coldstream in May and June.

As proofs of a disposition in short-horns to fatten, many facts might be adduced. The famous Durham ox of Mr. Charles Collings of Barmpton was computed to weigh, at five years old in 1801, 168 stones imperial, and was purchased to exhibit, on the 14th May 1801, by Mr. John Day, for £250. Mr. Day could have sold him on that very day for £525, on the 13th June for £1,000, and on the 8th July for £2,000! He travelled him for six years, and after all that long confinement, and eight weeks of illness, the ox weighed when killed 165 stones 11lb. the four quarters. In 1808, Mr. Collings exhibited a four-year old white heifer, which was estimated to weigh 130 stones. In 1815, Mr. Thomas Smith of Grindon had two five-year old oxen, which were computed to weigh 160 stones each. One of them (called Caps-all)

was afterwards exhibited through a great part of Scotland and England. Mr. Smith sold ten beautiful fat cows one year at Berwick June fair, which had all slipped calf, for 32l. a-piece, and which were computed to average 90 stones each.

Two very fine oxen, three years old, were shown by the late Mr. John Rennie of Phantassie, at the Show of the Highland and Agricultural Society of Scotland in Edinburgh, in 1827. They obtained the first premium for the best pair of short-horn oxen, were supposed to weigh 110 stones, and 115 stones the four quarters, and were sold after the show at, I believe, 50l. each.

The Spottiswoode ox, bred by Mr. Spottiswoode of Spottiswoode in Berwickshire, was perhaps the largest ox that ever was exhibited. As I was at one time a little interested in this ox, I may be permitted to give his history. He was out of a country cow, by a short-horn bull, brought to Thornydyke by Mr. Swan, from the neighbourhood of Morpeth. There was no particular notice taken of him till he was two years old, when he had outstripped all his companions on the ordinary food of the farm. During the two following summers he was kept by himself, with only a calf in a small park; and fed on turnips in winter. He was fully fed in the fifth and sixth years of his age, and, when rising seven, he was sold in June 1802 to my father and uncle, butchers in Dunse, for 210l., including the value of the waggon which was made on purpose to exhibit him in. His dimensions at that time were:—height of the shoulder 6 feet four inches, length from nose to rump 12 feet 4 inches, girth behind the shoulder 10 feet 2 inches, breadth across the hooks 3 feet 1 inch; computed weight 320 stones, of 14 pounds to the stone. After being exhibited for about a year in the principal towns in Scotland, when a handsome profit was realized from him, he was sold to Messrs. Johnston, Richardson, and Morrison, for 350 guineas. In the race week at Newcastle, in 1803, he drew 30l. a day. On his way through Durham 600 guineas were offered for him. He was subsequently shown in London and in all the principal towns in England. Falling lame, probably from long confinement, he was brought back to Scotland, and put into the Canonmills Distillery at Edinburgh, to be fed off, but refusing that kind of food, and probably feeling much pain from his increasing lameness, he fell off prodigiously in condition, which rendered it necessary to kill him.

But not to dwell only on examples of great weights at great ages, I may mention, that the late Mr. Robertson of Ladykirk sold steers and heifers from 1814 to 1822, varying in age from three years and two months to four years and a half, whose four quarters produced from 90 stones to 135 stones of beef, and tallow from 15 stones to 26 stones each. Mr. Robertson has often brought his fat cows to 100 stones each. Many farmers in Berwickshire and Northumberland bring their three-year old oxen to 80 stones or 90 stones. In a central part of Forfarshire, Mr. Stephens, at Balmadies, sold in 1830 a five-year old short-horn cow which had slipped calf, and which gave milk for eighteen months. She was fed on turnips and straw from only November to April, when, being slaughtered by Mr. Robert Small, Dundee, she produced 72 stones of beef the four quarters, and 23 stones 8lb of tallow. And even so far north as Kincardineshire, Captain Barclay Allardice of Ury can show as heavy steers as any breeder, having realized 40l. a piece for three-year-olds at his an-

nual sales. All these weights were obtained by common feeding.

In a breed of cattle evincing a disposition to fatten, it is erroneous to suppose that this property is only obtainable by an extraordinary consumption of food at an unprofitable rate. I have heard this supposition frequently asserted as an undeniable truth by many farmers who were unacquainted with short-horns. Indeed, such a supposition can only have arisen from ignorance of the constitutional habits of the breed. It is well known to every feeder of cattle that every ox in the same lot does not feed alike; and to what does he attribute this difference in the capability of feeding, but that one ox is a "harder feeder," or, in other words, is more difficult to feed than another? He does not maintain that the hard feeder consumes less food than the kindly feeder, for he sees and knows the reverse to be fact; on the contrary, he allows that the difference of feeding arises from a difference in the "nature," or, in other words, the *disposition*, of the animal. He observes that a restless ferocious disposition not only prevents the possessor of it from feeding, but his companions also. It must therefore be allowed, that an ox of a kindly, will lay on more beef with the same quantity of food than one of an unruly and churlish, disposition, and hence it is more profitable to feed an ox of a kindly than of an opposite disposition. Still a difficulty may reasonably arise in the mind of one unacquainted with short-horns. He may acknowledge that an ox of gentle disposition may lay on more beef with the same quantity of food; that knowing the hardness of feeding exhibited by some kinds of cattle, that property of itself cannot convince him that it may not cause more food to be consumed than the larger quantity of beef obtained may be profitable. To one unacquainted with the disposition to fatten in short-horns, this difficulty in feeding may appear insurmountable. But experience would soon prove to him that short-horns not only possess disposition to fatten, but that they consume less and less food in *proportion as they attain weight and fatness*. Disposition to fatten, therefore, means not only the acquisition of more beef with the same quantity of food, but the diminished consumption of food in proportion to the weight of beef acquired.

The profit arising from feeding short-horns may be exhibited from a few instances. I have seen Mr. Thomas Smith of Grindon, receive, at Whitsunbank Fair, for four-year old steers, 44*l* a-piece. The late Mr. Robertson of Ladykirk has frequently received 35*l* a-piece for three-year olds. I remember in 1815, that he showed, at the meeting of the Border Union Agricultural Society at Coldstream, two three-year old oxen, which were computed each to weigh 110 stones. Happening to be at Morpeth market a short time afterwards, I saw these two oxen, with six others, sold for 45*l* a-piece, and the two were resold before they left the market at sixty guineas a-piece. Mr. John Rennie used to realize 40*l* a-piece for three-year old oxen, at the sales which annually took place at Phantassie. I have seen the late Mr. George Brown, who was in Whitsome Hill, Berwickshire, in 1815, sell the whole cast of his beasts, twenty in number, at twenty-five guineas a-piece. Such prices cannot be considered unprofitable, or if they are, the rent of land must be exorbitantly high.

Disposition to fatten insures another valuable property—early maturity. This property is almost peculiar to short-horns. It is obvious that a disposition to fatten cannot develop itself till the ox

is supplied with more food than will merely support life. Young cattle are frequently restricted to such quantity of food as will only support their growing condition. This practice probably had its origin in that period of husbandry when the raising of food for animals attracted little attention from the husbandman; and even after food became more plentiful, young cattle were restricted in its use, from a conviction, erroneously acquired, that only cattle of mature age could be fattened. This prevalent practice confirmed a habit of treatment which was extended even to short-horns till a very few years ago. It was a prevalent custom for breeders of short-horns to keep them till four, and sometimes five years old, before they were fed off. Now that the breed is improved and generally distributed, a more profitable system obtains. Three years is the longest period, and very frequently oxen are fed off at two years of age. I have frequently seen Mr. Robertson have two and a half year old steers sold for 26*l* a-piece, and brought to a weight of 72 stones each. The late Mr. Abraham Wilson of Edington Mains, used to bring two-year olds to 80 stones, and sold them at 28*l* a-piece. Mr. John Rennie of Phantassie often exhibited two year olds at 80 stones each, and realized 30*l* a-piece for them. At the great sales of stock which took place at Phantassie, Mr. Rennie always realized 30*l* a-piece for two-year olds.

These instances prove very satisfactorily, that two-year old short-horns can be made fit for the butcher; but of course, in accomplishing this object, proper management is requisite. To show what good management can accomplish, I may mention that I have seen breeders of short-horns, who farmed fineturnip land, but could never obtain more than 10*l* to 12*l* for two-year olds, while their neighbours, on inferior soil, obtained 20*l* for cattle of the same age; and yet in the former case, as much food had been consumed as in the latter. By improper management, the advantages to be derived from the largest portion of the food are sacrificed. But many breeders, eminent as first-rate farmers, have no desire to sell their cattle till they have attained the age of three years. At this age they will easily attain 70 stones, or 75 stones, and a few to 80 stones. Such a system is pursued by Mr. Smith of Shedlaw, Mr. Wilson of Preston, near Dunse, and some others, such as the late Mr. Hogarth of Ballieknow, near Kelso. They all produce first-rate three-year olds. I am of opinion, however, that the two-year old system is more profitable. The object of all farming is profit, and that can best be obtained by supplying cattle with more food, and keeping them a shorter time on the farm than three-year olds generally are, provided they can be brought to *maturity* at an earlier age.

I have already shown that short-horns can be brought to maturity at two years old. Let us suppose a case to illustrate my position. Suppose that a breeder dispose of twenty fat three-year olds every year, he will in that case require to winter sixty head of cattle;—twenty on full feeding, twenty one-year olds and twenty two-year olds, on half feeding. Instead of this arrangement, suppose the breeder kept thirty one-year olds, and thirty two-year olds, which were annually fed off. My position is, that this latter arrangement will realize more profit than the former. For, suppose the twenty three-year olds attain 70 stones weight each, which, at 6*s* per stone, gives 21*l* for each ox, or 420*l* for the twenty. On the other hand, suppose the thirty two-year olds attain 50 stone each,

at 6s per stone, they would give 15l each, or 450l. in all; showing 30l, or more than 7 per cent., *additional* profit. Another important consideration in this argument is, that the risk of loss of life on sixty head of cattle, is considerably less over two than over three years; and I have heard the annual average loss of cattle throughout the country rated as high as 3 per cent. This sort of calculation will apply to a small or a large farm. The supposed weights of 70 stones for three-year, and of 50 stones for two-year olds, appear to be fair averages for ordinary years on most farms; and 6s per stone may also be taken as a fair average price for beef at Morpeth since the war, and it is the regulating market for prices in the north of England. The feeding off at two years old, is a system which is fast gaining ground in the country; and as it makes a quick return for capital, which is a desirable result in times when profits are low, it should induce every one to bring up all their cattle, which are intended to be disposed of, at the feeding pitch from the period of birth.

Besides being of early maturity, short-horns yield beef of fine quality. It is the opinion of many breeders, particularly of black coloured cattle, that a four or five year old Scotch ox carries finer quality of beef, which fetches a higher price per stone than a young ox. If both the oxen are equally ripe, the difference in the quality of the beef is not discernible; and a well fed two-year old short horn heifer will fetch as much per stone at Morpeth market, if not more, for cutting up, than any aged ox. This preference to heifer beef holds in other markets in the north of England, as at Darlington, York, Skipton, and Wakefield. The reason for this preference is obvious,—there is scarcely any coarse beef in short-horn heifers; they carry most of it on their backs, and other most valuable parts; on all those parts, in short, which yield roasting rather than boiling beef. Roasting and steak beef will fetch in every market a higher price than boiling beef. I have seen lots of steers and heifers bred and fed together, and when brought to market, the heifers, although four or five stones lighter than the steers, would fetch a higher price per stone, on account of their finer quality, which is always held in high estimation. In other parts of England, however, heifer beef is not preferred to ox. In Smithfield, for instance, a prime Scotch ox, either Galloway or West Highland, or any other breed, if he carry beef on the best parts, such as ribs, rumps, and sirloins, will obtain the highest price of the market. Carcass or wholesale butchers in London, buy oxen to cut up to suit their respective customers. Retail butchers, and tavern and eating-house keepers, who are their customers, buy roasting and steak beef, from the rumps, sirloins, fine ribs, and thick flanks, and will pay for it from 4s 8d to 5s per Smithfield stone of 8lb. Buttocks, thin flanks, middle ribs, shoulders, and briskets, though profitable for family use, do not fetch more than 3s 4d or 3s 8d per stone; while all the coarse parts, such as the houghs, clods, and stickings, will not realize more than 1s 8d or 2s per stone. It is difficult to account for the predilection for ox beef in one part of the kingdom, and for heifer beef in another. It is well, however, for the promiscuous dealer and breeder, that large markets exist for both; and they should remember that *only* the best quality of beef, whether of heifer or of ox, fetches the *highest* price.

Whilst considering the subject of the quality of beef, I cannot too earnestly press upon the breeder

the necessity of breeding cattle only with fine points. These alone carry beef of the finest quality, and these alone realize the largest profit. Every breeder in Scotland, whether he *fatten* his cattle or not, should treat them as if all heifers were to be sent to Morpeth, and all oxen to Smithfield, the largest market for cattle, as every body knows, in the world. To Smithfield market! What have *we* to do with Smithfield? exclaims a Scotch breeder. Smithfield is every thing to you. It is the great mart for consumption in the country; should you not find a suitable market for your well fed oxen, upon which you have bestowed much trouble, and which you cannot afford to part with at a small price, you have steam-ships ready at the nearest large shipping port to take them to Smithfield. But should you have no *fat* cattle to dispose of, and dislike the trouble of sending them to a distant market at your own risk, still you have a strong interest in Smithfield market through your *lean* cattle. As thus:—Cattle are generally purchased by dealers in the northern counties from breeders, in small quantities; and are driven south to the Falkirk Trysts, or other markets, to meet other dealers who purchase them, already selected in lots, to drive still further south to markets in England. There they are again purchased by feeders or graziers, who either sell them at home to dealers who take them to Smithfield, or consign them direct to a Smithfield salesman. Of course, those cattle of the finest quality, and shewing the greatest proportion of beef on the fine points, obtain the highest price, and their worth is duly appreciated by every dealer through whose hands they may happen to pass.

As one example will give a better illustration than many arguments, I shall instance the practice of a celebrated dealer in north country black cattle, Mr. Charles Macomie in Aberdeenshire, to illustrate the mode of dealing in cattle in Scotland. When such extensive dealers as Mr. Macomie go to a country market with the intention to purchase, they select cattle with a view of suiting their customers, who they know will purchase them according to their respective tastes; and as they may have finer or coarser keep for them. They select four or five from one lot, six or eight from another, and so on, till they make up a lot of perhaps fifty, or, it may be, a hundred cattle, all well selected, matched, and having the appearance of being bred by the same person. They make up several such lots of cattle of different characters to suit different customers. These they take to Falkirk, where they are purchased by south country dealers, who have a view of disposing of them to particular dealers or graziers in England, and take or consign them to Smithfield after they are fattened. Such selected lots of cattle will insure pleasure, if not profit, to every one through whose hands they pass. The salesman in London is proud in having such to dispose of. The carcass butcher thinks himself fortunate in having fallen in with a fine lot. The hotel, tavern and eating-house keepers, are pleased with their purchase of prime rumps and sirloins; while the epicure chuckles with delight over his savoury roast or steak.

Every breeder should therefore be careful to cultivate good points in his cattle, and always steadily keep in view that they may one day or another appear at the greatest market in the world, where their worth will be duly appreciated; and even although they should never reach

Smithfield, the possibility of the beef which he has bred and fed being served up on the table of his Majesty, looking invitingly in the dining-hall of the nobleman, or gracing the hospitable board of the Lord Mayor, ought to stimulate every breeder to the production of an article which would be worthy of being so honourably preferred. We may depend upon it, that the caterers for these high dignitaries will only select the finest quality of beef, irrespective of the condition of the individual, be it humble or otherwise, who had cherished, or of the more humble shed which had sheltered, the object of their choice. Such customers are able and willing to pay a good price for good beef. Nay, lean cattle of fine quality will always command a market when those of inferior quality cannot be turned into money at any price; and even small cattle, if of superior quality, will obtain a higher price per stone than large coarse animals.

I was once present at an amusing altercation between five men who were appointed judges of cattle at an agricultural show. Three were in favour of one short-horn bull, and two of another. The favourite bull of the three was a much larger animal than the other, but shewed inferior points as to quality of beef. One of the two asked the other three, "Whether roasting or boiling beef was worth most money per pound? Two remained silent, but the third answered, he was 'not aware of the difference in that part of the country,' which was the north of the Frith of Forth. 'Then,' rejoined the one of the two, 'roasting beef sells from a penny halfpenny to two pence a pound more in London than boiling beef from the same animal.'" The spokesman of the three deprecated any reference to London practice. He was immediately replied to, that "breeders had a very strong interest in the English market, for four-fifths of the cattle bred in Scotland are driven into England and consumed there, and therefore they ought to study to supply what was suited to the English market, and that was fine quality of beef. The large bull with coarse points," he added, "was only fit to get cattle suitable to his Majesty's ships, whereas the other could get them fit for his Majesty's table." In this remark it is not to be understood that I acquiesce in the opinion, that *inferior* quality of beef is good enough with which to provision his Majesty's navy. Far from it. Every gallant defender of his country deserves to share the best produce which his country can supply. But it is well known that cattle cannot be too large for shipping, as large grained beef stands the salt better on long voyages, whereas size is no object when fine quality is only required.

Disposition to fatten and early maturity are the only means by which profit, both to the feeder and the butcher, can be insured. This proposition may not be self-evident, because, as has been already demonstrated, that if these properties are the results of fine bone, small head, and compact form, little offal will be left to the butcher for his profit, whatever the carcass may be to the feeder. In these respects the butchers' profit on short-horns are no doubt small; but as a compensation for the diminished value of the less useful parts, nature has caused these same properties to secrete an increased supply of valuable fat or tallow in the interior of the animal. And thus, short-horns, when ripe, at whatever age, "die well." The instances which I have already related of the quantity of tallow yielded by the large oxen, cows, and

heifers, varying from twelve stones to twenty-six stones each, indicate the source of profit to the butcher which exists in the interior of the animals of this breed. The tallow alone would be, in most cases, a sufficient profit to the butcher. These instances of from twelve stones to twenty-six stones of tallow are certainly extraordinary, but even in ordinary cases of six or eight stones, the value of the tallow more than compensates for the small value of the rest of the offals.

Natural docility of temper, which the short-horns possess in a remarkable degree, renders their disposition to fatten more effective. A good tempered animal receives all the benefits to be derived from the food which he consumes. This is very apparent in feeding oxen. But the bulls even are gentle, and never become mischievous, excepting under particular provocation: and the cows, and heifers, and calves, can be approached for any purpose at all times, in the field and in the house.

It would be an interesting investigation to ascertain how the short-horns have been enabled to originate, maintain, and extend apace the celebrity which they have so long enjoyed. I fear such an investigation cannot be pursued with much satisfaction, for the origin of this breed, like all other existing breeds of cattle, is enveloped in obscurity. All that we know of the mode of maintaining the proved good qualities of any domesticated breed is to preserve the *purity* of its blood; but what is understood by purity of blood, and how it can be preserved in practical breeding, is more easily conceived than defined by breeders. In practical language, *purity of blood* means freedom from an immediate intermixture between different varieties of cattle; and it is preserved in practice in the highest degree by the union of selected males and females, free from that immediate intermixture and close relationship. Blood, in the sense used by breeders, does not mean mere consanguinity in animals of the same kind, for breeds of animals exist which shew no symptoms of purity of blood; but it denotes the exercise of those superior influences which improve the external characters, and give a refined tone to the useful properties of animals. The external characters of animals are described from the form, bone, colour of the horns (if any), and structure of the head. The useful properties originate in the improvement of the external characters. Hence, the *points* form the true index to them. The useful properties, however, must acquire permanency before they can exhibit a refined tone. The refined tone constitutes the "high blood" or "high breeding," as it is commonly called, and it acquires its greatest vigour or bloom when *all* the useful properties arrive at the greatest degree of perfection. Animals thus made perfect attain the highest degree of domestication,—the state in which they yield the greatest profit to man. This high tone, however, may be too much refined, it may lose its bloom, and exhibit symptoms of decay. When it declines, that is, when the points become coarse or obliterated, the external characters undergo great and rapid mutation; and the useful properties dwindle into worthlessness; the good points disappear, and bad ones substitute themselves in their stead. The refined tone may thus be regarded as the pendulum of the domesticated animal economy, the altered oscillations of which indicate the approach to, or recession from, the acme of the point of perfection in domesticated animals. This refinement can only be observed in

domesticated animals. The external characters of wild animals are always permanent, but they may or may not possess the useful properties desired by man. Those which do possess them might be usefully domesticated, and their utility rendered permanent by the acquisition of a refined tone, or "blood." The power of practically exercising those influences which improve the external characters, and give a refined tone to the useful properties, has evidently been conferred by Providence on man, to enable him to domesticate animals, by rendering these properties eminently useful to him.

As an illustration of permanent external character being differently impressed by nature and domestication, I may instance the two opposite cases of the urus and the wild horse. The urus possesses few or perhaps none of the useful properties to man of the domesticated bull and cow, though its external characters are quite permanent. The wild horse of the Savannas of South America and the Steppes of Tartary, possesses all the useful properties of the domesticated horse, and has retained them, though he is not, like the urus, strictly a wild animal, for he is the descendant of the domesticated horse let loose, and possesses, in most particulars, the properties of the blood horse of Arabia and England. Were our domesticated cattle let loose, it is as probable their descendants would retain the useful properties as permanently as the wild horse now does. The horse of Arabia is a domesticated animal, and his "high blood" can be traced back to antiquity, where it eludes our research. In like manner, the "high blood" of our short-horn cattle may one day be traced back to antiquity by our posterity.

If my view of the characteristics of blood in the domesticated animals be correct, then other races of animals than the blood-horse possess "blood," or are "high bred." True, it is not the same tone which pervades different races of domesticated animals. The difference in blood is exhibited by a difference in the refinement of the tone, owing probably to the idiosyncrasy of the race; and each race which shows "blood" or "breeding" has a refined tone correspondent with its permanent useful properties. The refined tone of the race-horse stallion corresponds with the external characters and useful properties of his race; and that of the short-horn bull corresponds with the external characters and useful properties of his race. The refined tone of the cart mare is in accordance with the external characters and useful properties of her kind; and that of the Leicester ewe is in accordance with the external characters and useful properties of her kind. Distinct races of domesticated animals have therefore distinct traces of refined tone, or "blood," or "breeding."

*(To be Concluded in our next.)*

## EAST SUFFOLK AGRICULTURAL ASSOCIATION.

The fourth annual meeting of this association was held on Thursday, Sept. 10, at Saxmundham. Owing to the unfavourable state of the weather, the rain falling heavily during a considerable part of the morning, the attendance was not by any means so numerous as that of the preceding year, at Wickham-market. The show of stock generally was exceedingly large, being much greater than at

any previous meeting. There was a large assemblage of horses, in excellent condition, and it was the general opinion, that there had never been, on any former occasion, a finer display in the county. There were 11 stallions on the ground, 19 beautiful Suffolk mares, and 11 geldings. The show of neat stock and sheep was likewise excellent, particularly the latter. Some Southdown tups belonging to Mr. Thomas Crisp, of Gedgrave, attracted general attention, as did also some Southdown sheep and tups, the property of A. Arcedeckne, Esq. Mr. Thomas Capon, of Dennington, showed a very beautiful Hereford ox, three years old, and weighing about 80 stone. It was greatly admired, and Mr. Capon was complimented upon the superior specimens of stock which he invariably exhibits. Mr. Colchester sold Mr. Edwards's rams at from 12*l.* each. The Duke of Newcastle's steward selected six. Mr. Edwards's celebrated cart stallion, which won the prize at Wickham-market in 1833, was knocked down at 60*l.* Mr. Cana sold a Southdown shearing tup, the property of Mr. Arcedeckne, at 15*l.* There was a large collection of agricultural implements. Messrs. Garrett and Sons, of Leiston, exhibited a new seed and manure drill, by which any quantity, from 10 to 20 bushels per acre of pulverized manure with seeds at the same time, may be deposited by the use of one horse, at the rate of 9 acres per day. They also exhibited a machine to clear away smut seeds and dirt which injure a sample of wheat. The judges of the horse stock and swine were, Mr. Cattling, Butley Abbey; Mr. John Blake, Wickham-market; Mr. Thomas Roberts, Alderton; and Mr. John Burch, Charsfield. Of the neat stock and sheep, Mr. Charles Adams, Barton; Mr. Ethridge, Starston; Mr. Thomas Waller, Eyke; who were assisted by Mr. Isaac Churchyard, of Pettistree.

About 4 o'clock nearly 500 gentlemen partook of an elegant cold collation, in a spacious building in the yard of the Bell Inn, provided by the landlord, Mr. Thompson. Above the head of the chairman, we observed on a blue banner the motto, "Agriculture and Commerce, England's glory;" at the other end of the room, above the vice-president's chair (which, for some reason or other, was not occupied, nor were even any of the seats in the vicinity), another blue banner, with the old motto of "Church, King, and Constitution." The right hon. the Earl of Stradbroke took the chair, and was supported on the right by Sir T. Gooch, Bart., Rev. R. Wilson, Rev. J. H. Groome, A. Arcedeckne, Esq.; and on the left by Lord Henniker, M.P., Sir W. Middleton, Rev. W. R. Norton, Rev. A. Greville, and Joshua Rodwell, Esq., &c. &c. We also observed present, Sir Charles Blois, Sir J. Rowley, R. N. Shawe, Esq., J. Moseley, Esq., R. Farr, Esq., — Leman, Esq., J. Mingay, Esq., Rev. E. Wade, Rev. — Westhorp, Captain Bates, J. Woods, Esq., and Messrs. Revans, Gildersleeves, R. and A. Ransome, Wolton, T. Crisp, &c.

The Earl of STRADBROKE proposed "Our gracious, excellent, and constitutional King, William the Fourth;" three times three.—"The Queen and the Royal Family." (*Applause.*)

The Noble CHAIRMAN again rose, and said he should now propose a toast in honour of the day. Since they last met, a short but eventful year had passed, which, by the blessing of Providence, had been the means of producing prosperity and peace in most parts of the country. If it were their misfortune to deplore, in some parts of that their native county, that they had not been blessed with the same productions which had favoured other

parts of England, still he did not observe on that account any diminution in their numbers that day, no want of sympathy, or any reduction of that good feeling which ever had, and he firmly believed ever would, characterise the members of that association, in endeavouring, to the utmost of their power, to emulate each other, to the best possible advantage, in protecting and encouraging good conduct amongst their poorer brethren. (*Applause.*) He must, indeed, lament the absence of one member, a noble lord, the excellence of whose stock had been the constant theme of their admiration. (*Cheers.*) It was with pleasure that he had to announce to them, that their funds were in a flourishing condition, and that they would be enabled, when the subscriptions were paid up, to maintain and improve the amount of donations which they had hitherto awarded. Some alterations might possibly be required in the details connected with the proceedings of the society, which had better be settled at a committee meeting. He was anxious that the premiums for stock should be confined to that which is bred in the county only—(*cheers*)—and that they should not preclude those scientific ploughmen who had once received rewards, from being again enabled to compete for the prizes; in fact, he wished them to be given to the most scientific, and the most deserving, and that they should not continue to go by mere routine. (*Cheers.*) They must have remarked the manifest improvement in the greater part of the stock exhibited, and more especially in horses and sheep. He would venture to state, that notwithstanding the unfavourable state of the morning, they had never before had an opportunity of seeing exhibited in that county, so many horses and sheep of so excellent a quality. Such was the opinion also of many gentlemen with whom he had conversed. It was difficult, indeed it would be impossible for him to touch upon any new topic connected with a meeting of that description. He should therefore propose “Prosperity to the East Suffolk Agricultural Association;” three times three, and “one cheer more.”

“The Lord Lieutenant of the County.”

“The Army and Navy.”—Sir Joshua Rowley returned thanks.

LORD HENNIKER proposed “The health of their noble president;” three times three, and one cheer more.

The EARL OF STRADBROKE returned thanks, and gave “Mr. Arcedeckne and the vice-presidents;” three times three. A. Arcedeckne, Esq., returned thanks.

The SECRETARY (Mr. C. Welton) then proceeded to read the names of the parties to whom the prizes had been awarded; after which, the treasurer (Mr. Woods) retired to deliver them to the successful candidates.

The following is a list of those who received prizes in the

#### SECOND CLASS.

- |                                                                                                                                 | £  | s. | d. |
|---------------------------------------------------------------------------------------------------------------------------------|----|----|----|
| 1. To Mr. Wm. Spink, Eyke, the owner of the best stallion, for the general purposes of agriculture, bred in Suffolk .....       | 10 | 0  | 0  |
| 2. To Mr. Crisp Plant, Farnham, the owner of the 2nd ditto .....                                                                | 5  | 0  | 0  |
| 3. To Mr. Charles Todd, Otley, the owner of the best brood mare, for the general purposes of agriculture, bred in Suffolk ..... | 5  | 0  | 0  |
| 4. To Mr. Morris Crisp, Letheringham, the owner of the 2nd best ditto .....                                                     | 3  | 0  | 0  |

- |                                                                                                                                                |   |   |   |
|------------------------------------------------------------------------------------------------------------------------------------------------|---|---|---|
| 5. To the owner of the best 3-year old colt, for the general purposes of agriculture, bred in Suffolk .....                                    | 4 | 0 | 0 |
| [This prize was not awarded, as there was no colt shown of sufficient merit.]                                                                  |   |   |   |
| 6. To Mr. Thomas Crisp, Gedgrave, the owner of the best, 3-year old cart filly, for the general purposes of agriculture, bred in Suffolk ..... | 4 | 0 | 0 |
| 7. To Mr. Moses Crisp, Letheringham, the owner of the best gelding, for the general purposes of agriculture, bred in Suffolk .....             | 3 | 0 | 0 |
| 8. To Mr. Geo. Hare, Freston, the owner of the 2nd best ditto .....                                                                            | 2 | 0 | 0 |
| 9. To Mr. Thomas Crisp, Gedgrave, the owner of the best Suffolk bull .....                                                                     | 5 | 0 | 0 |
| 10. To Mr. Robert Parker, Westleton, the owner of the best bull of any other breed .....                                                       | 5 | 0 | 0 |
| 11. To Mr. Henry Wright Bramfield, the owner of the best Suffolk cow, in milk or in calf .....                                                 | 5 | 0 | 0 |
| 12. To the owner of the best cow, in milk or in calf, of any other breed .....                                                                 | 3 | 0 | 0 |
| [None of sufficient merit.]                                                                                                                    |   |   |   |
| 13. To the owner of the best two-shear tup, of the pure Southdown breed .....                                                                  | 4 | 0 | 0 |
| [None of sufficient merit.]                                                                                                                    |   |   |   |
| 14. To Mr. Bennett, Cheveley, the owner of the best shearing tup, of the Southdown breed .....                                                 | 4 | 0 | 0 |
| 15. To Mr. Edwards, Sutton, the owner of the best two-shear tup, of any other pure breed .....                                                 | 4 | 0 | 0 |
| 16. To the owner of the best shearing tup, of any other pure breed .....                                                                       | 4 | 0 | 0 |

The SECRETARY then announced that the committee had resolved that the honorary silver medal of the society be presented to Mr. Edwards, of Sutton, as an acknowledgment of his improved system of management, and of the high condition of his large farm of light land. (*Applause.*) The medal was then presented by the Earl of Stradbroke, and Mr. Edwards said he was happy to receive such a token of their approbation at the hands of the noble lord.

The SECRETARY then announced that the committee had also resolved to present the honorary silver medal to Mr. James Hillen, of Blaxhall, for his extraordinary exertions in farming, and in the application of artificial manure. The medal being presented to Mr. Hillen, he said he was gratified by their favourable opinion of his exertions, and he trusted that he should always deserve it. A silver medal was next presented to Mr. Thomas Girling, of Wrentham, for his extraordinary exertions in agriculture. Mr. G. returned thanks. A silver medal was also presented to Ishmael Cutler, shepherd to the Earl of Stradbroke, as an ac-

knowledge for his having reared more lambs from a given number of ewes within the last four years, than any other shepherd within the limits of the association.

The Earl of STRADBROKE next proposed "The health of Mr. Shawe, and the Committee;" three times three.

R. N. SHAWE, Esq., rose amidst loud cheering. After returning thanks, the hon. gent. said he would take the present opportunity of making an observation upon something that fell from the noble lord, in proposing prosperity to the East Suffolk Agricultural Association. If he had understood his lordship correctly, he had said, that in future stock not bred in the county of Suffolk was to be excluded from the exhibition for premiums. Now, he would very respectfully suggest, that such a regulation might in some degree interfere materially with the objects of the association. The object they had in view, was to promote the breed of cattle, and if they excluded from the premiums, those cattle that were imported into the county, they would at the same time exclude themselves from that improvement in the breed, which could be gained only by competition, and from that excellence in quality which he hoped to see the stock of this county attain.—(*Loud applause.*) When the society was first proposed, it was generally supposed that it was to be conducted upon the principle of the one in existence at Thetford. At that time his own feelings were, that the Thetford Society had scarcely answered the purpose for which it was intended. It produced a great meeting certainly, but it was not a meeting for the sale of wool only; it had other purposes to answer, but to which he should not now particularly allude. He had lately been in Oxfordshire, where a society was established, in which he believed a gentleman, well known to Sir Thomas Gooch, Mr. Ashurst, took an active part. He had consulted that gentleman upon the mode in which sales of wool were conducted in that county. Mr. Ashurst told him that they did not fix a person to sell in the room or at the dinner; but they left it to the parties themselves. They provided a large barn for the wool belonging to those individuals who choose to bring it and deposit it, in bulk or in sample. Thither the buyers resorted, and made their selections as they thought fit. He did not see that they should confine themselves to the mere offer, by the gentlemen, of wool to any single buyer at their wool fair. He thought it would be a much better plan to have parties to bring their wool for sale, or to sell it by sample, or in bulk, just as they pleased. The principal of the Dorchester Wool Fair was this: two large barns were provided; in one the wool was exhibited in the morning, and in the other, the parties having dined, and the chairman having necessarily provided himself with all the information he had been able to procure, they then resorted again to the wool barn, where the sales took place. This was found to be completely successful, and the buyers were brought together, because they could meet with the article, and much better prices were obtained. (*Cheers.*) He would now throw it out as a suggestion, that they form a Committee to re-consider the principle on which the Suffolk Wool Fair was established, and he had no doubt, if he could prevail upon the noble lord to give his consideration to the question, and attend a meeting of the committee for that purpose, that they would be enabled to put the matter in so tangible a form, as to be really beneficial to the interests of the community at large.—

(*Applause.*) He was sorry he could not say there was an immediate prospect of relief for the depressed agriculturist; but amidst all the gloom and all the darkness by which they were unhappily surrounded, there was, nevertheless, a speck of light which had at length begun to make its appearance. He must say, and he had told the agriculturists over and over again, that the attainment of high prices was impossible. He cared not to which party they belonged; for he only quoted the opinion of the committee of which his hon. friend, Sir T. Gooch, was chairman, who have declared, that so long as the low price of corn arises from the growth of the country, no legislative enactment can interfere to make a rise. (*Loud cheers.*) He believed that doctrine to be sound. (*Continued cheers.*) There were many fallacious opinions abroad. If they could not raise the prices, they might take off those burthens which press upon agriculture—which relate to agriculture alone—(*cheers*)—which are imposed upon real property alone; and in which no other branch of the community bears a share. (*Cheers.*) He alluded to local burthens—to the poor rate and to the county rate. (*Applause.*) To be sure in the course of the present session something had been done. (*Laughter, and cries of "Nothing,"* from the upper part of the room, which were answered by loud cheering from the other end.) Well, then, suppose that nothing had been done in the shape of substantial and immediate relief, still a most important principle had been embraced, for an acknowledgment had been made that they were paying that which they ought not to pay, except in conjunction with other classes. When they applied that principle to the principle of the land-tax, he wanted to know why the land should pay a tax, to which no other interest is subject? And again, if they applied that principle to other things bearing on the interests of agriculture, it would be found equally important. He knew that in speaking upon this subject, he touched upon delicate ground; and he felt it to be his duty, in addressing a large agricultural community, composed of all classes, and entertaining opposite opinions, to leave party feeling out of the question. He had said, there was a light that had, at length, broken in upon them. They were now going to experience the effects of the provisions of one of the most important laws that had been passed within the limits of his recollection—he alluded to the important change, now about to take place in the administration of the poor laws. (*Laughter.*) He knew it had been abused by parties, who though they might have read it, yet had not given themselves time to understand its principles. It had been said that it would be oppressive towards the poor. If it were so, he (Mr. S.) for one would not support it. So far from its being calculated to injure the poor, and so far from its not being calculated to afford relief to agriculture, he believed it would be beneficial to the one, and a boon to the other. Let them look to the state of the labouring poor at the present moment. During the last year he found 44 poachers in Ipswich gaol, 33 of whom were receiving parochial relief at the time of their commitment. How, he would ask, did this arise? Why, simply from the old system of giving men money for doing nothing. (*Cheers.*) He would then say, if they had been wrong, let them seriously and earnestly endeavour to set themselves right. They had a correct principle before them, upon which they might proceed with safety. It was not contended, as it had been reported, to take the poor man out of his cottage,

and to place him in the workhouse. By no means. The man who from infirmity or casualty was compelled to come to his parish for relief, was not put into the poor-house, but was provided for on the authority of a magistrate, who upon his own view of the case, was authorized to order such relief as should be found necessary. The effects of the bill would be, to show that commerce and manufactures, and agriculture, go hand in hand—that the capital of the country is fully capable of supporting the labouring population—and that the latter has hitherto been in some measure prevented by the law of settlement. He quoted the statement from the mouth of a gentleman who made it, and he had investigated the subject, viz., that at the present moment there was room for placing in Lancashire, not less than 90,000 families. And what were the terms? It was purely voluntary on their part: an agreement was made with the labourer for three years, to receive so much for his own labour, so much for the labour of his wife, and so much for the labour of his children. A cottage was provided for his use, together with every necessary article of furniture, and he had to sign a contract engaging to remain in it for three years. It may be said that a change may occur, and that in consequence of any depression to the manufacturing interest, the labourer may be discharged. The ability to afford future employment is calculated by an extensive inquiry as to the number of orders given for machinery, which at the present moment amounted in value to more than four millions of money, and the use of this machinery and its application to the cotton trade, had been carried on at almost an unlimited extent. The removals into Lancashire had gradually increased of late years, viz., from 4 to 8, and from 10 to 20, and ultimately, to 40,000 individuals, and yet there was still room for 90,000 more. Surely then, here was at once some relief for the local burthens which press upon us, and for a rescue from the anomalous situation in which we stand. (*Loud cheers.*) But this was not all; if they, by the formation of the different unions, could provide for a considerable proportion of the surplus labourers who pressed down the energies of agriculture, and if they could manage the affairs of the unions properly and economically, he would turn round and say, that having during the present year, admitted the principle that half the cost of prosecutions was fairly chargeable to other branches of the community—he said, the commerce of the country, the funded—(*“And the currency,” from a voice*)—and the landed interest might then readily and cheerfully and easily bear the burthen and share it between them.—(*Loud cheers.*) The moment they establish the unions—the moment there was an economical distribution—the moment, he repeated, that these things came into full play, then the agriculturists were entitled to have the remaining portions of the community take a share in the general burthens. After some further observations, the hon. gentleman sat down amidst loud cheering.

The CHAIRMAN gave “The Members for the County,” and observed that he had been requested by Sir Charles Vere, to state that he deeply regretted his absence, but his health was such as to oblige him to go to Cheltenham. Three times three.

Lord HENNIKER returned thanks in behalf of himself and his hon. and gallant colleague. After congratulating the society on its prosperity, he said, were he to enter on one or two topics that had been adverted to by his friend Mr. Shawe, he

felt that he should be bound to enter into a discussion of greater length than perhaps upon an occasion like the present, it would be fitting for him to do. He should, therefore, abstain entirely from entering upon those topics. (*Cheers from the upper end of the room.*)

The CHAIRMAN gave “The health of Mr. Bennett and the successful competitors for the various prizes.” (*Cheers.*)

Mr. BENNETT returned thanks, and as the only remuneration he could give in return, would state some little experience which his bailiffs had derived in the flock of last year. They tried an experiment with the ewes, in a complaint called “*straining*,” from which they suffered much. A great number of ewes had been saved in consequence of the application of the recipe he had obtained, but which he regretted to say he was not allowed to make public. (*A laugh.*) He hoped to see the experiment tried generally, as it would be attended with great advantage to the flock masters.

The Rev. E. WADE begged pardon for interrupting, but how could the experiment be tried, if they were not told of what it was composed, and how to apply it. (*Laughter.*)

Mr. BENNETT replied that it might be ascertained from an application to Mr. Gall. He then concluded by stating, that he had proposed and contributed a prize of two sovereigns for the following year, to be given to the shepherd who shall have lived the longest time with any member of the association. (*Applause.*)

The CHAIRMAN, after a high eulogium, proposed “the health of Sir Thomas Gooch;” three times three, and one cheer more for ‘the good old English gentleman.’”

Sir Thomas GOOCH returned thanks. He was grieved to see the low state to which agriculture was reduced, but there was one comfort even in their affliction, viz., that their courage seemed to rise with their danger. (*Cheers.*) He did not wish to see manufacturers rise upon their ruin, though no one rejoiced more than himself at their prosperity. When he was told that it was impossible for any minister, let him be whom he would, Whig, Tory, Radical, to do any thing for the relief of the landed interest, he must at the same time say it was possible for a minister to abstain from putting words into the mouth of his sovereign at the opening of the session, saying that their distress should be taken into consideration, and yet do nothing at all. (*Cheers.*)

Mr. REVANS, in allusion to what had fallen from Mr. Shawe on the subject of the Suffolk Wool Fair, said he was of opinion if the fair was managed agreeably to the principles on which it was established, it would prove totally adequate to the purposes for which it was intended. Much had been said about a combination among the buyers. That was a fallacy, and he thought the buyers might with as much propriety say something about combination amongst the sellers.

“Success to the West Suffolk Association.”

Mr. AMYS (Rickinghall) returned thanks.

The health of “the Judges of the stock, and thanks to them for their exertions.”

Mr. ETHRIDGE returned thanks.

The CHAIRMAN proposed “The health of the Secretary, whose services were fully appreciated, and who he need not say was of the greatest utility to the society.”

Mr. C. WELTON returned thanks.

After some further discussion, the noble earl retired, and the meeting broke up soon afterwards,

THE ARABIAN HORSES PRESENTED BY THE KING OF OUDÉ TO HIS MAJESTY WILLIAM IV.

## THE KING'S ARABIAN HORSES.

(Plate.)

Amongst the presents lately sent from the Nabob of Oude to William IV. were two Arabian Horses; and through the polite attention of Colonel Wemyss his Majesty's gracious permission was obtained to view these interesting animals, and also to present their likenesses to our readers, which were sketched with the utmost fidelity and truth, by Mr. W. H. Davis, painter to the Queen.

On the 26th of August, I visited Hampton, where the King's breeding stud is kept, and to which place the Arabians in question had been sent, after remaining a few days in the stables at Pimlico, and was highly gratified with a sight of these beautiful animals, which I looked well over. In the first place I must observe, that these horses had left the vessel which conveyed them from India to this country only a fortnight, after having been closely confined for four months, during which they had evidently encountered the heavy gales so prevalent in the neighbourhood of the Cape. Under such circumstances their condition could not fail to be very much reduced; and, although they were thus presented under the greatest disadvantage, they appeared lively, playful, good-tempered, and manifested the light, elastic, elegant characteristics of the genuine Arabian horse.

The more prominent figure, whose complete lateral form is presented to the eye, is the finer animal of the two, and his height is greater than that of any Arabian which has hitherto fallen under my observation; on standing up to him, I judged his height to be at least fifteen hands, perhaps a trifle more, yet scarcely reaching fifteen hands and an inch. The true form of the animal is well represented in the engraving, which the reader will perceive, exhibits that well defined obliquity of shoulder, wide spread, well set-in quarter, and length of posterior sweep, so pre-eminently indicative of speed and power, and which, even at the present moment, distinguish the beautiful variety of the tribe under consideration from all ramifications of this most elegant quadruped in nature. In these essential principles or elements, our turf horses are inferior to the genuine Arabian, as well as in the fine form of the head, which is truly and well represented in the engraving. Were we disposed to criticise this splendid horse with fastidious nicety, we might say that his hocks were rather too straight; in this part he is inferior to his companion, as well as in that prominent development of the muscle of the thigh, which appears so conspicuous in the latter.

The second horse, whose figure is only partially seen, is not so large as the animal already described; but superior in the shape of the hock, and in the muscular development of the thigh; yet, on the whole, not so fine a horse.

I was unable to ascertain the distinctive appellatives of the animals under consideration, as the swarthy sons of the East (two in number) who attended them on their passage to this country, were either unable or unwilling to communicate this intelligence to those to whose care they resigned them at Pimlico. But, that the horses were regarded by the Indian grooms as creatures of a superior class was evident, from their manner of treating them, as the following incident sufficiently demonstrates. On surrendering their charge they washed their feet very carefully, and on one of the stable attendants offering them a sponge for the purpose of finishing the operation, they turned away contemptuously, and drawing from their pockets fine white muslin handkerchiefs, substituted them for the superior instrument which had been offered them for the purpose; their medium of oral communication to the horses was a sort of whistle, varied according to circumstances; they appeared much attached to their charge, and resigned the animals with a sigh.

In colour they are a light or silver grey, black mane and tail, the smaller of the two, presenting that appearance to a trifling extent which is well understood in the language of the school, by the term *flea-bitten*. Mr. Worley, the principal stud-groom (from whom we received every attention) was kind enough to let me see them move; they were very light, very corky, and playful; but after so long a voyage at sea, in the close confinement of a vessel, it could not be expected that, in so short a period, they had regained their wonted action: indeed, the smaller horse was evidently stiff behind, while the extremities of his hocks bore indubitable indications of the boisterous weather which had been encountered during the passage from India to this country.\*

I have no doubt that the strain of blood of which these Arabians are a specimen, is very highly prized by the Potentate who presented them to his Majesty; and I am inclined to think, from their appearance, that it has been continued too long without intermixture.

Those who have exercised their goose-quill on the subject of the Arabian horse, have been, for the most part egregiously ignorant of the doctrine which they professed to impart to others: and, as if to make up for lack of knowledge by extraneous ingenuity, they endeavoured to amuse their deluded readers by a fanciful classification which never had existence except in their own prolific brain; thus the hard, but unmeaning, terms, *Koch-lain*, *Nezdi*, &c. &c. are pompously, yet mysteriously, displayed, as if they contained a sort of magic which rendered the subject a matter of marvellous astonishment rather

\* In the same building which contained the Arabians, we saw the favourite hack of George IV., a powerful cob-like flea-bitten gray; the last horse crossed by this monarch, who was, perhaps, the quickest judge of horse-flesh that ever existed.

than of sober philosophical investigation. The superiority of the thorough-bred horse or courser is derived from the quality of his bone, tendon, muscle, and animal organization. He is originally from the tropical or hot climates; and may be said to offer a sort of contradiction to the general rule, since we find that, in the burning regions of the earth, animated nature attains the largest size. This is strikingly exemplified in the lion, and all the varieties of the cat kind, the elephant, &c. These animals uniformly decrease in stature and bulk according as the climate becomes milder where they are found. In the vegetable kingdom also, we perceive a similar rule; trees and plants attain an immense size near the equator, and decrease in proportion to the distance they are removed from it.

The horse, however, forms an exception to this rule; he attains superior qualities, it is true, in the torrid zone, but in bulk, he is left at a very great distance by the unwieldy animal of the same tribe found in Normandy and the Netherlands, in the marshes of Lincolnshire, and also in the county of Leicester. The cause of this difference in bulk and quality is easily ascertained. The Arabian or Eastern horse, whence our thorough-bred horses have been derived, is bred and reared under a burning sun. The climate, judging from the living example, would seem to be favourable to the production of that ivory-like bone, large tendon, and firm elastic muscle for which the thorough-bred horse is so eminently distinguished; while the food which he receives, being principally hard and dry, and containing the greatest portion of nutriment in the smallest compass, must very much assist the climate in producing the effects already mentioned. This supposition seems confirmed by the circumstance, that the little mountain horse of the Arabian desert is the smallest of the various ramifications of the Eastern horse, while the texture of his bone, tendon, and muscle is decidedly superior to that which is found in any other variety of his tribe: \* he is fed almost uniformly on dry food; which, with the scorching heat of the climate, checks his growth, but gives him uncommon strength and solidity. If we look at the Persian or the Turkish horse, which is regarded as thorough-bred, we shall find him much larger than the mountain Arabian; yet by comparison, neither so strong or so fleet; because, being fed upon more succulent food, and breathing a milder atmosphere, he attains a greater bulk, but experiences a depreciation in those valuable qualities already enumerated. These degrees or gradations are ren-

dered manifest, as we proceed to milder climates and softer food, till we at length come to the enormous draught horse, whose immense bulk is attained in the luxuriant marshes of Flanders and other places, where the very succulent herbage increases the size of the animal, but renders his bone more porous, his tendon softer, and his muscle less firm and less elastic.

Hence it will be perceived that the horse acquires his superior qualities beneath a tropical sun, while he attains his greatest bulk in the mild regions of the northern hemisphere; but, if we follow this animal to the higher northern latitudes, we are again presented with the striking influence of climate upon him. He becomes small in the Highlands of Scotland, smaller in the Shetland Isles, a complete dwarf in Iceland, and in regions still nearer the Pole, he ceases to exist altogether. His coat attains a glossy silky compactness beneath the African and the Asiatic sun, it is much coarser in the milder parts of Europe, longer and coarser as we proceed north, till in fact it assumes the outward appearance of bristles, with a soft lining close to the skin, in order to protect the animal from the rigours of the climate.

Yet it may be remarked, that the Arabian horse reaches much greater perfection in this country than in his own native and arid deserts: he attains a much larger size, becomes more fleet and more powerful, a consummation which is effected by the English system of breeding, rearing, and training the racer. The foal is supplied with milk in profuse abundance in addition to that of its mother, which is seldom deemed sufficient for the object in view. As soon as it is able to masticate corn, it is liberally supplied with the choicest that can be procured; and, indeed, in all the early stages of its existence, nothing is withheld which it is supposed will increase its strength, its vigour, and its growth. It is kept warm, groomed with the most laborious attention, fed as highly as possible, and exercised accordingly. The animal thus attains a superior size, more strength and greater speed, than the source whence it sprung, its original parent, the native Arabian. It must be admitted, however, that this system, where nature is assisted by art to the utmost possible extent, is by no means destitute of its attendant evils; as the animal, thus highly fed, is very liable to inflammatory action, and consequently very subject to disease. It would seem as if nature were unable to bear the burden thus forced upon her; and, as the ordinary channels are not sufficient to carry off or dissipate the superabundant juices, curbs, spavins and a train of diseases are often the consequence,—the modern racer may be said to be constantly liable to "*fly to pieces*."

As the racer receives much more food than ordinary, so he is subjected to much more exercise also; and hence we frequently find

\* Such, at least, seems to be the case, if a judgment is to be formed on the subject, from the experiments which have hitherto been made in this country; but these experiments and their results are very inconclusive, and by no means satisfactory to an inquiring mind. I shall further discuss this subject in the course of the present article.

his legs will not stand; and, as like produces like, so to this cause, I think, may be attributed the faulty or diseased fore legs which we so frequently perceive in horses with any pretensions to breeding, the disease or defect having been communicated from sire or dam to the progeny. This is strikingly exemplified in the stock of Champion, as well as in the stock of many more horses which might be enumerated; in fact, it is a rarity to meet with a racer of four or five years old whose legs are perfect. The food of the racer is administered in such abundance, (and that too of the most nutritious and invigorating quality) and his exercise is so severe, that none but a thorough-bred can consume the one, or endure the other. I am aware I shall be told, that many cocktails (not thorough-bred horses) have been trained; and I am ready to admit, many that have been called cocktails have endured the regular system of training, have consumed the requisite quantity of food, have gone through the regular exercise, and have been produced on the course in splendid condition: in the season of 1833, such was the case with Napoleon le Grand, Swing, and many others; all of which I have not the least doubt were as thorough-bred as Eclipse or Smolensko; in fact, the thorough-bred pedigree of several of these horses was afterwards incontestably demonstrated. Many acknowledged thorough-breds are unable to bear training; nor need a greater proof of genuine blood be necessary than the capacity for feeding, and the qualities requisite for enduring the exercise to which the racer is subjected.

We have increased the size, the strength, and the stride of the Arabian horse; but in many cases have lost his light, elastic, bounding, deer-like action. In fact, it rarely happens that the *action* of the genuine Arabian is continued many generations from the original stock: it is manifest in the first or perhaps second remove, but becomes, as we proceed, lost or swallowed up in greater length of stride, and more bulky powers of propulsion. Three or four years ago, I went early in the morning, a day or two preceding the races, to the Liverpool course for the purpose of witnessing the exercise of the horses. A little chestnut attracted my notice: I observed him walk for some time: he then took his gallop: I felt a conviction that he was not far removed from the original stock. On inquiry, I found the horse to be Mr. Atwood's Argantes, his sire a genuine Arabian. His action was beautiful, and he won several minor stakes, but he had no chance against the much greater stride, and much greater power, of our first-rate horses. It is not till several removes from the original stock that the length and power of the English race-horse can be attained, when his Arabian progenitor can no longer contend with him on the Turf. Where our racers unite the Arabian action with their own immense stride, their speed is wonderful, such was the case

with the celebrated Sir Peter Teazle, and the same remark will apply to Lottery, to Long-waist, to Fylde, to Fleur de Lis, to Signorina, &c. &c.

From the present mode of conducting the operations of the Turf, our splendid coursers seldom, if ever, attain a perfect maturity. The elegant quadruped under consideration thrives, the male till he is seven years old, the female till she has reached her sixth year; whereas, few of our racers continue on the Turf till they attain this age, being battered to pieces before they have acquired their natural growth and strength. Having already noticed the manner in which the racer, in early life, is forced forward by calling in the aid of every artificial mode of assisting the rising operations of nature, we shall here state, that, at the age of two years, he is brought upon the course; indeed, yearling races are not unknown. But, to put the contest of yearlings out of the question, let us view the racer at the age of two years. At this period, his bones cannot have acquired solidity, nor his tendon that firm elasticity so essentially necessary in the violent, and frequently overstrained, exertion of the course. Now if, under such circumstances, an animal is put to the greatest possible exertions, it follows, as a necessary consequence, that his joints, and the ligatures attached to them, must undergo so much distressing tension as to injure, if not totally to ruin him. It is true, our two-year old races are for short distances; but then considerable weight is placed upon the young animals. Two-years old are frequently troublesome to start and manage; and therefore, instead of boys being placed on their backs, they are ridden by more experienced jockeys: the weights for two-years old are, in general, colts 8st 6lb, fillies 8st 3lb, which, although they might be well enough where the animal had attained something like maturity, become a very heavy load for a creature whose bones and sinews have not received half their developement.

Fillies suffer less than colts from these premature exertions, because they arrive at maturity sooner. Even at three-years old there appears not only something injudicious, but cruel, in subjecting the animal to such severity as the race-course generally calls forth, particularly if he is *large for his years*, as the term is; that is, has attained more than ordinary height, presenting at the same time an incipient appearance of large bone and tendon; such an animal must necessarily be weak; he has overgrown his strength, and if put to the utmost severity of exertion, can scarcely fail to sustain serious, if not irreparable injury. An instance of this sort was presented to my observation in the month of July, 1833: it was at the Liverpool Aintree meeting of that year; when Satan, by Lottery, a very promising three-years old, ran a very severe race for, and won a sweepstakes. The same day he started for one of the plates, which he also won, after four very distressing

heats. This colt was large for his years, and the business just mentioned ruined him for any further successful running that year: in fact, it ruined him altogether as a racer. On endeavouring to train him the following year, first one leg and then the other gave way. I well recollect the *destruction* of this promising young horse. After he had won his first very severe race, and I perceived his trainer (Dawson) was preparing him to start for the plate, I was proceeding to expostulate with him on the impropriety of compelling a very promising young horse, but large for his years, and consequently weak, to a reiteration of such desperate exertion; but I found it was by the consent of the owner, and Dawson himself was of opinion no harm would result from it. The plate was won by Satan, after four very severe heats (as I have before observed), when it was found necessary to bleed him. Two days after, he seemed well; and his owner was weak enough to start him in less than ten days after at Lancaster; but he could not race. Nature had been overstrained. He was ultimately allowed to rest for a considerable time; to no purpose, as I have already stated. Can it be expected that the stock of such a horse will be sound. Like generally produces like; and though from good sound mares, a superior animal might be produced, in general the result would be otherwise: the defects of the sire would be communicated to the offspring.

It often happens that a good free-going creature is destroyed by too much running. This was rendered strikingly manifest in the case of that excellent mare Sarah. When a few years ago, she belonged to Chapman, she started about eighteen times one season, and did not lose more than two or three races. The next year she could do nothing, though she looked tolerably well. She passed into the hands of Sir John Gerard, was allowed rest, and was brought out again, but to no purpose: the outrageous severity of the work she had undergone in the season just mentioned had completely crippled her powers of speed and endurance: nor would she be at all calculated for a brood mare, as no animal with a diseased or a battered constitution is calculated to produce a vigorous or healthy stock.

Had I the means, and were anxious to produce superior horses, I would not allow them to be put to any distressing exercise or work in early life: before they are called upon for the display of their utmost power and speed, they ought to have attained something like maturity. By this means we should see fewer blemished horses, and should possess a much superior stock. But the operations of the Turf are opposed to such a mode of proceeding. The great stakes are principally for three-year olds, from which aged horses are debarred. Cups would be open to the latter; but as many of these are handicapped, the superiority of a horse no sooner becomes known, than he is weighted to re-

duce him to the level of a common plate-horse.

The celebrated horse, Dr. Syntax, furnishes an example of what may be accomplished by judicious treatment. He underwent no distressing trials in early life; and when at length his extraordinary powers became ascertained, his owner (the late Mr. Riddell, took care to place him well, and never allowed him to start more than a very moderate number of times in any one season. The consequence was, he won more cups than any horse that ever appeared on the turf, was rarely beaten, and did not finish his racing career till (if my memory be correct,) he was fourteen years old.

When the genuine blood was first imported into this country, it must have been mixed with that of the indigenous horse, or with something of the kind; and what number of generations it must pass through before the acknowledged thorough-breed is produced, has not been determined; nor is it likely that it ever can be ascertained with precision. Where a stain finds its way into the pedigree or blood, it is sometimes difficult to obliterate; while, in other cases, it may perhaps be easily washed out. This is a matter which will not admit of mathematical demonstration; but we may reasonably conclude that our thorough-bred horse is the Arabian steed, improved in size and strength by superior keep, superior grooming, and superior management.

It has been stated, that eight removes from the impure strain constitutes genuine blood; but such an assumption is vague, unphilosophical, and, in fact, amounts to nothing: no definite period can be fixed.

It will be necessary to remark, that what are called Arabian horses vary very much in size and quality, and I am of opinion the genuine mountain Arabian has seldom been seen in this country. I have met with a score, perhaps, which have been called Arabian horses, but not more than six of them impressed me with the idea of the genuine unalloyed stock. I have several times been invited to see what have been reputed Arabians, the owners of which have been displeased when I ventured to doubt the purity of their blood. The most palpable attempt at imposition in this way which ever fell under my observation, was that of a light, dirty coloured dun horse, offered for sale in Liverpool, about twelve years since, called Bellerophon: this animal, in form, resembled the Suffolk punch.

We are told there are various classes of Arabians, and that the Barb inherits the genuine blood. We are further told that the celebrated Godolphin Arabian was a Barb, of which, however, I am doubtful, as his immediate descendants proved racers. There may be Arabians of different classes for aught I know to the contrary; and Bruce, in his travels, tells us, that he met with a breed of these noble animals (in Nubia, or Dongola, if I mistake not,) which generally reached the height of sixteen hands, with form and action

superior to the mountain horse, or what, for the sake of distinction, I will call the genuine Arabian. If so, and a fresh supply of Eastern blood were deemed requisite by our breeders, by the importation of a few of these horses, the greatest obstacle in the way of the little horse would be removed—size and stride could be immediately obtained.

I never saw a *black* Arabian; and as very few black racers have made any figure on the Turf, I am inclined to think there are no genuine blacks. When, therefore, I have observed a black racer, I have always attributed his colour to a stain in the blood, however far distant. It is well known that animals will *breed backwards*, as it is called; and I have more than once been surprised, amongst a litter of pointer whelps, to find one a complete setter, without being able to trace the strain to either the sire or dam.

After all, the superior power and speed of the thorough-bred horse is the result of a superiority of animal organization, and a superiority of texture in the bone, the tendon, and the muscle; and at the same time that I unhesitatingly promulgate this doctrine, I candidly admit, that this animal organization, this texture of the parts enumerated, will be vainly sought in any variety of the tribe except the genuine blood, or thorough-bred horse.

The true Arabian seldom reaches much more than fourteen hands; but the same blood in this country becomes much larger: yet, there would seem to be a maximum beyond which it were useless to attempt to force the animal under consideration, at least for racing. When a horse reaches more than sixteen hands, he seldom possesses the requisite qualities for racing. Our best racers, generally speaking, have been under sixteen hands; while very large horses have seldom appeared to advantage on the turf. The largest thorough-bred horse I ever saw stood nearly seventeen hands, and was uncommonly powerful. I saw him at Melton, in the month of November, 1832. He was the property of Mr. Little Gilmour, and as a hunter was supposed to be inferior to no horse in England. He was called *Vignt-un*: and when I first saw him in the stable and stood up to him, I was astonished at his immense size: nor could I scarcely believe that his performance in the field was equal to the current report concerning him till I had convinced myself by actual observation. *Vignt-un* could not race, but, as a hunter, was very fleet, carrying, I should think, about fifteen stone. When I saw him, he was in splendid condition. He appeared in colour a sort of chestnut, which, perhaps, might be the effect of singeing, a process lately introduced, and which appears much superior to clipping.

In the next stall stood *Plunder*, a thorough-bred bay horse, nearly as high and as powerful as *Vignt-un*, and little, if any, inferior to him as a hunter; so that it would appear if these over-grown thorough-bred horses make no figure on the turf, as hunters they

are unrivalled. I am very well aware, that when sufficient bone and substance can be united with what is called blood, the horse becomes invaluable as a hunter: no half-bred, no horse, with even a trifling stain, ever can go with him, can go through dirt and heavy ground so well, or can struggle for so great a length of time; he is as superior to all others in the field as the thorough-bred is to the cock-tail on the race-course, for reasons previously given, namely, greater solidity of bone, greater firmness, strength, and elasticity of tendon and muscle, as well as a decided superiority of animal organization. But the difficulty is to meet with thorough-breds of sufficient bulk; yet, that they are to be obtained is evident, as Mr. Little Gilmour had in his stable, at the period before-mentioned, eight thorough-bred horses, every one of which was equal to fifteen stone up to the fleetest hounds in the kingdom.

Fylde, bred by the late Mr. Clifton, of Lytham, was a remarkable instance of a large horse being able to race: he was sixteen hands and a half high. Had he been trained to hounds instead of the course, he would have made the best hunter perhaps the world ever saw. In early life, his action was observed to be of a very superior order; and when put into training, it was perceived that he possessed superior speed. The Arabian action was continued in him in a great degree, and, in consequence he became a very superior horse. He was ultimately sold to go to the United States, where he was safely landed, and is by far the best horse ever imported by the Americans; being well bred, finely formed, action beautiful, legs perfectly sound.

I have heard it remarked that thorough-bred horses do not jump well, and am ready to admit that when a horse has been trained to the course, and has raced, perhaps, for several seasons, his stroke and mode of going have become very different from those which should characterise the perfect hunter; but let the blood-horse be trained to the field instead of the course, and it will be found that he will become a superior jumper.

Having already slightly noticed the qualities of the thorough-bred horse, it will be necessary to say a few more words on the subject, in order to shew, that the term *blood* is a misnomer, and that the superiority of the horse in question is derived from his superiority of form and texture; and which, as I have before observed, has never been found in any other variety of the tribe. The elucidation of this question brings us to the consideration of the philosophical

#### PRINCIPLES OF SPEED AND POWER.

That progressive motion is the result of mechanical organization every one will readily admit who has ever considered the subject, however slightly; and this motion will be found superior or otherwise, precisely in proportion to the form and quality of the mechanism by which it is produced. This is sufficiently ex-

emplified in the movements of the horse and the ox; the power of propulsion produced by the mechanical organization of the former being much greater than that of the latter, consequently the animal mechanism must be of a much superior form and quality. Similar reasoning will apply to the progressive motion of the thorough-bred, compared with the draught horse; and, indeed, we shall perceive these differences in quadrupedal movement gradually lessen as we approach what is called full blood; and the ratio, generally speaking, will be in proportion as the animal is allied to the thorough-bred; or as a groom would describe it, in proportion to his blood.

Having already observed that the superior organization of the thorough-bred horse is to be found in no other variety of the tribe, at least in the same perfection, it will naturally be expected that I should produce something like proof to demonstrate the truth of this assertion. As the most striking example of power and speed, applicable to the present case, by way of forcible illustration, we may instance the hare, which, taking her size and weight into consideration, is the fleetest quadruped in the world. The weight of this surprising little creature varies from six to eight pounds, yet she is fleetest than the generality of horses! Whence, then, is this extraordinary speed derived? From her peculiar formation, or superior mechanical organization. At the first glance, the hare presents an uncommon length of hind quarters and hind legs, which gives to her fore legs a shorter appearance than is in reality the case; she is thus enabled to bring her hind feet so forward as to increase her stride to an incredible extent. The stroke of the hare is equal to that of the greyhound, though she is not more than a quarter his size, if so much. According to generally received notions, the length of the hare's hind compared with her fore legs, is quite out of proportion; yet this is the most obvious cause of her amazing celerity. The hare is low before, and very high behind; and when we consider her more attentively we shall find the leading principle of speed just mentioned is very much assisted by the backward slope of the shoulder, aided by a great depth and expansion of chest, while the quarters reach an uncommon length into the back, as it were, which, added to the length of her thigh, give her a sweep superior to that which is observed in any other quadruped; at the same time, she is equally remarkable for the breadth of her loins, as well as for her firmness of muscle. Her feet, unlike those of the dog, are destitute of ball, which enables her to distance her pursuers on hard, flinty, or sharp stony ground: and her extreme length of toe essentially assists her extraordinary powers of progressive motion.

In the figure of our fleetest greyhounds, we may observe something of the hare-like form, viz., the low-dropping chest, the sweep of the hind quarters: a fleet greyhound, like the hare, though not to the same extent, will ap-

pear high behind and low before: at the same time, he will be remarkable for breadth of loin and large muscle.

A similar remark will apply to the fleet and powerful modern foxhound. Yet, for the sake of illustration, it will be necessary to notice an error, which Somerville was the first to promulgate, and which has been uniformly adopted by breeders of foxhounds ever since. Amongst the requisite qualifications for speed in the foxhound, Somerville particularly recommends the "round cat foot."

"his rush grown tail  
O'er his broad back bends in an ample arch;  
On shoulders clean, upright, and firm, he stands;  
His round cat foot, straight hams, and spreading thighs,  
And his low dropping chest, confess his speed.

The *round cat foot* is in direct opposition to the principles of speed. If we look at the hare, we shall find, that her foot is *remarkably long*, by which her speed, beyond all question, is much accelerated, as very trifling reflection will incontestibly present to the mind. The foot of the hare may be compared to the pastern of the horse, as the one and the other exercise much the same influence on progressive motion. It is well known that a horse with very short pasterns can never be remarkably fleet: his action, indeed, far from being light, elastic and easy, will offer the very reverse to the eye of the spectator, as well as to the feelings of the rider. Let it not, however, be supposed for a moment, that I recommend a *very long* pastern. A happy medium should be observed. But I will venture to state, that a short pastern in the horse amounts to much the same as a "round cat foot" in the foxhound: they are both opposed to speed.

Therefore, in considering the principles of speed and power in the horse, let us not lose sight of the form of the hare or the greyhound. The horse is very much slower, by comparison, than either of the animals just mentioned; but it will be found, the nearer he approaches the form of them, the greater will be his speed. The best horses that ever appeared on the turf must have exhibited the form just described. This was the case with Eclipse, as the portraits of him clearly indicate. As a modern specimen, I would take Lottery, whose low-dropping chest, uncommon strength and sweep behind are sufficient testimonials of extraordinary powers. Bessy Bedlam is another remarkable instance of the same kind. A similar observation will apply to that once charming racer, Longwaist, and to fifty others which have fallen under my observation. Birmingham, though his hind legs appeared rather awkward, was very highly raised behind. Plenipotentiary, who won the Derby, at Epsom, in 1834, is a remarkable illustration of the principles of power and speed here laid down. From certain whippers which were buzzed about, Plenipotentiary became one of the favourites long prior to the day of running: in fact, the trainer found the horse could easily beat every one

against which he was tried, and yet was so surprised at the circumstance, that he could scarcely believe the evidence of his own eyes, because the horse was formed differently from his notions of speed: *his hind quarters were uncommonly heavy*, which may be thus interpreted:—he possessed immense length and power in his hind quarters. Speaking to a veteran turfite on the subject, he advised me not to back Plenipotentiary, as no horse could go with such heavy hind quarters.

It is not an uncommon observation with the unreflecting, that "*horses will go in all forms*;" but nothing can be more erroneous. I will admit that an object may be accomplished in more ways than one, and that therefore horses may be fleet which present a different figure to the eye; but they must possess the leading principles—they must be low before and elevated behind. Let any person capable of reflection, consider the subject for some few seconds, and he will perceive that, as the power of impulsion, or rather propulsion, is derived from the hind quarters, these must possess great strength and great length and sweep, to enable the horse to be a fleet or fast galloper. If, on the contrary, the fore legs are long, and the hind quarters short, the horse cannot bring his hind feet sufficiently forward, he is rendered incapable of the requisite stride, and must be slow. We meet with what are called portraits of celebrated horses (as that of Flying Childers, for instance,) where the reverse of the requisite form is exhibited—where the animals are represented high before and low behind; but these said-to-be portraits cannot be otherwise than grossly incorrect, as they appear in direct violation of the essential principles of speed.

Where there is great speed there must be great strength, as one cannot exist without the other. As the hare is distinguished for speed, so she is remarkable for strength also: any person who has held a living hare in his hand will acknowledge the uncommon strength which she is capable of exerting. A similar remark, but in a less degree, will apply to the greyhound; a similar observation may be extended to the thorough-bred horse.

The term, *Daisy-cutter*, is frequently applied to the thorough-bred horse, to the true courser; and very correctly so: but the term requires explanation. *Daisy-cutting* very expressively signifies that a horse goes close to the ground; that, in fact, his stroke is so fine, or passes over the surface of the turf so closely, that daisies, were they to intervene, would be cut by his feet, or rather shoes. A horse going in this form makes the most of the matter; and the advantage of it will be clearly seen, when we compare it to the high or lofty goer. If the horse, in galloping, lifts his feet high, his stride will be shorter than that of the near-going horse, or daisy-cutter; it will be shorter precisely in proportion to the elevation of his feet. All very fleet horses, therefore, must be *daisy-*

*cutters*. But this mode of going does not proceed from the quality of the horse, or on account of his being thorough-bred, as is generally supposed; on the contrary, it is entirely the result of education. The young animal intended for the turf, in his exercise, from the mode in which he is ridden, is thrown forward, and taught to go as closely as possible; and whenever it so happens that a horse can be got into this mode of going, he cannot be very fleet. If, in defiance of education (training), the animal perseveres in high or lofty going, his action is *lumbering*, he cannot get over the ground so swiftly as the daisy-cutter, while his mode of going is more laborious and more fatiguing.

All true racers will be found to be daisy-cutters: further, they will be found to carry their heads very low, or, as an old turfite would say, "*like a pig*." This mode of going was strikingly manifested in Lottery, in Long-waist, in Fleur de Lis, in Dr. Syntax, and, indeed, in all the best horses that ever appeared on the turf.

---

MR. COBBETT'S STARTING IN THE WORLD.—At eleven years of age my employment was clipping of box-edgings and weeding beds of flowers in the garden of the Bishop of Winchester, at the Castle of Farnham, my native town. I had always been fond of beautiful gardens; and a gardener, who had just come from the King's Gardens at Kew, gave such a description of them as made me instantly resolve to work in these gardens. The next morning, without saying a word to any one, off I set, with no clothes except those upon my back, and with thirteen halfpence in my pocket. I found that I must go to Richmond, and I accordingly went on, from place to place, inquiring my way thither. A long day (it was in June) brought me to Richmond, in the afternoon. Two-pennyworth of bread and cheese and a pennyworth of small beer, which I had on the road, and one-halfpenny that I had lost somehow or other, left three pence in my pocket. With this for my whole fortune, I was trudging through Richmond, in my blue smock-frock and my red garters tied under my knees, when, staring about me, my eye fell upon a little book, in a bookseller's window, on the outside of which was written: "*Tale of a Tub*; price 3d." The title was so odd, that my curiosity was excited. I had the 3d. but then I could have no supper. In I went, and got the little book, which I was so impatient to read, that I got over into a field, at the upper corner of Kew-garden, where there stood a hay-stack. On the shadowy side of this, I sat down to read. The book was so different from anything that I had ever read before: it was something so new to my mind, that, though I could not at all understand some of it, it delighted me beyond description and it produced what I have always considered a sort of birth of intellect. I read on till it was dark, without any thought of supper or bed. When I could see no longer, I put my little book in my pocket, and tumbled down by the side of the stack, where I slept till the birds in Kew-gardens awakened me in the morning; when off I started to Kew reading my little book. The singularity of my dress, the simplicity of my manner, my confident and lively air, and, doubtless, his own compassion besides, induced the gardener, who was a Scotsman, I remember, to give me victuals, find me lodgings, and set me to work. And it was during

the period that I was at Kew, the present King and two of his brothers laughed at the oddness of my dress, while I was sweeping the grass-plot round the foot of the pagoda. The gardener, seeing me fond of books, lent me some gardening books to read ; but these I could not relish after my Tale of a Tub, which I carried about with me wherever I went, and when I, at about twenty years old, lost it in a box that fell overboard, in the Bay of Fungay, in North America, the loss gave me greater pain than I have ever felt at losing thousands of pounds. This circumstance, trifling as it was, and childish as it may seem to relate it, has always endeared the recollection of Kew to me.—*Cobbett's Register*.

## THE NETHERLANDS.

(From Mr. Evans's valuable Work on Agriculture.)

The agriculture of the low countries, especially Flanders, has been celebrated by the rest of Europe for upwards of 600 years ; Holland, for its pasturage, and the Netherlands for tillage. The climate of Holland is cold and moist. The surface of the country towards the sea is low and marshy, and of the interior sandy, and naturally barren. The soil in the low districts is a rich, deep, sandy mud, sometimes alluvial, but more frequently silicious, and mixed with rotten shells. The soil of the inland provinces is, in general, a brown or black sand, naturally poor, and, for whatever it is productive is indebted entirely to art.

There are other parts of the country where the poverty of soil and abundance of produce bear ample testimony to the skill and perseverance of the Flemish farmers. In the fifteenth century this soil consisted of poor light sand, and barren gravel and heaths. This soil produces now, rye, flax, potatoes, oats, buck-wheat, rapeseed, clover, carrots and turnips, generally, and wheat in favourable spots.

The landed property of Holland is in moderate, or rather small divisions ; in the richer parts, generally in farms of from twenty to one hundred and fifty or two hundred acres ; often farmed by the proprietor. In the interior provinces, both estates and farms are much larger, some farms from five to seven hundred acres, partly in tillage, wood and pasture.

The marvellous improvement of soil in the Netherlands is owing to a combination of laborious industry and sedulous attention.

No crop is sown without two or three or four ploughings.

For wheat, two ploughings, with two harrowings.

|                                |         |
|--------------------------------|---------|
| Rye, two or three              | do. do. |
| Oats, three                    | do. do. |
| Potatoes, four                 | do. do. |
| Carrots, four                  | do. do. |
| Flax, two                      | do. do. |
| Buck-wheat, four               | do. do. |
| Rape, three                    | do. do. |
| Barley, three                  | do. do. |
| Tobacco, four, two harrowings. |         |
| Hemp, four, two do.            |         |
| Turnips, three, three do.      |         |
| Spurry, do. do.                |         |
| Beans, two, two, do.           |         |

Fallow, four or five, and same of harrowing.

In this way the soil enjoys the full influence of the sun and the atmosphere, and is kept perfectly free from weeds. "To make a farm resemble a garden

as nearly as possible," says Mr. Evans, "was their principal idea of husbandry."

Every kind of manure is collected with the greatest care, and dispensed with the most judicious skill.

Urine cisterns are found in the field, to receive the purchased liquid manure ; but for that made in the farm yard, generally under the stables or in the yard. In the first case the urine is conducted from each stall to a common grating, through which it descends into the vault, whence it is taken up by a pump. In the best regulated farmeries, there is a partition in the cistern, with a valve to admit the contents of the first space into the second, to be preserved there from the more recent additions, age rendering it considerably more efficacious. This species of manure is relied on beyond any other, upon all the light soils throughout Flanders ; and even upon the stronglands, (originally so rich as to preclude the necessity of manure,) it is now coming into great esteem, being considered applicable to most crops, and to all the varieties of soil.

The frequent manuring given by the Flemish farmer astonishes a stranger ; the sources whence it is obtained in sufficient quantity form the difficulty, and this can only be resolved by referring to the practice of *soiling*, &c. the numerous towns and villages, and to the care with which every particle of vegetable or animal refuse is saved for this purpose. Manure in Flanders, as in China, is an article of trade. The selling price of each description is easily ascertained. The towns let the cleaning of streets, and the public retiring places, at great rents. Chaptal says there are in every townsworn brokers, expressly for the purpose of valuing night soil ; and that these brokers know the exact degree of fermentation in that manure which suits every kind of vegetable at the different periods of growth.

Every substance that constitutes, or is convertible to, manure, is sought after with avidity, which accounts for the extreme cleanliness of the Flemish towns and pavements, hourly resorted to with brooms and harrows, as a source of profit. Even the chips which accumulate in the formation of the wooden shoes, worn by the peasantry, are made to constitute a part of the compost dung heap ; and trees are frequently cultivated in barren lands, merely to remain till their deciduous leaves shall, in course of time, have formed an artificial surface for the purpose of cultivation. The manures in general use are—the farm-yard dung, which is a mixture of every matter that the farm-yard produces, formed into a compost, which consists of dung and litter from the stables, chaff, sweepings, straw, sludge, and rubbish, all collected in a hollow part of the yard, so prepared as to prevent the juices from being wasted.

**PLOUGHING MATCHES.**—From the great importance of good ploughing, every means should be adopted, to extend a practical knowledge of the art, in its greatest state of improvement ; and no plan has been found more effectual for that purpose, than the establishment of ploughing-matches, by which a spirit of competition among ploughmen is excited, by rewarding those who excel. At such meetings, farmers have been instructed, when they only came to be amused ; their prejudices have worn away ; and they have been induced to try new instruments of husbandry, and new modes of culture. Were it possible to impress upon the minds of farmers in general, the great importance of good ploughing, more especially the advantages of using ploughs with two horses, and without a driver, the expenses of cultivation would be greatly diminished, and several millions in value would be added, to the produce of the United Kingdom.—*Sinclair*.

## ON BLACK LEG IN CATTLE.

(FROM THE IRISH FARMER'S MAGAZINE.)

SIR,—Permit me to offer the following observations on the above disease. They were called for by the complaints in your valuable periodical, of the total neglect of medical men on this branch of the science and by a desire I have long felt to throw some light upon the maladies of the lower animals, and which, however simple to those who make the variations in function or in structure of man their study, are but too abstruse and complicated to the lay portion of the community.

The malady of which I shall now very briefly treat, carries with it in its very name, amongst those of your readers to whom a knowledge of it is of much importance, the idea of nothing but the certainty of death, and a sort of horrid mystery as to its cause—a mystery that seems to defy or scare away all efforts at investigation as to its cause, cure, or prevention. Nothing can prove this more strongly than the innumerable receipts or *cures* daily recommended towards effecting these objects, not any two of which agree in their action—nay, many containing substances completely neutralising the effects one of the other, and sometimes, and but too frequently, prepared from the worst acrid and deleterious articles to be found in the whole natural and chemical world.

Black-leg, mortification, gangrene, are synonymous words, and, to speak in precise terms, are the *consequence* of disease, which always exists either chronically—that is, spread over a long period of time—or acutely, running its course rapidly and violently to a termination. Mortification may also be the result of mismanagement of a naturally weak constitution, and is, I apprehend, the cause where it appears in animals which have shown no visible sign of previous disease. But of this I shall speak more at large hereafter, should the present paper prove acceptable to your readers.

As the principles for guiding the treatment are unalterably the same, whether applied to the animal (human or bestial), and whether old or young, perhaps if I take an individual case and describe the general primary appearance, course, and termination of the disease, it may strike more forcibly than would more generalised rules.

A calf, or young horned animal, is of very vascular structure, and of delicate muscular fibre, liable by the first, through over distension, to inflammatory action, and unable through the latter, to resist and throw off its attacks when seized upon. This delicacy of constitution, this liability to disease, is confirmed and increased by the breeder. In order to bring him in the shortest space of time to the greatest possible state of perfection, the animal is given access to the richest pastures, and tempted with the most stimulating diets. The manifest consequences of this are, an increase in the quantity and stimulating quality of the blood, a plethora, or fullness of body, a quickening of the pulse—in a word, such animal may be truly said to be living *faster* than is natural, and is by so many steps nearer to that condition where excitement terminates in inflammation, fever, and their direful consequences. At last this stimulation arrives at the point where nature can no longer withstand the wear and tear of constitution; some accidental impulse is given, say a slight change in atmospheric temperature, or a peculiarity in the nature of the pasture, when the already excited materials are blown into a flame. The hard and bounding pulse, the quickened breathing, the hot skin, the red, suffused, and languid eye, the parched tongue, the

limbs stuck out, props as it were, to support the labouring body, are all so many symptoms exquisitely marked, indicative of the fury of the fire that rages within; at last, the strength fails, the creature falls, the circulating system, unable to force its vital stream through every part, ceases in some; on these gangrene seizes. Just so we have seen many a gourmand, with red, and rounded cheek and bloated body, having undergone a precisely similar process of stimulation, hurried off by apoplexy, or seized with a brain fever, which if it cut him not off too suddenly, would assuredly terminate in mortification gangrene, or if you will, *black-leg*.

I am aware how loose and imperfect the above description is; it will answer, however, the purpose of this hurried notice, and will serve sufficiently to point out the only chance of cure.

In a disease which generally marks its span by *hours*, and of those but a few, on the prompt and judicious employment of *moments* safety alone depends. Lose not one instant; bled by a large orifice from the neck vein, and let your only stop be when you can get no more blood. In scientific language—remove the congestion, unstrain the distended vessels, and cut short inflammation, by inducing a new action. On recovering from the faintness (for on it depends your safety) and in a few hours, and should the pulse be still hard and jerking, bleed again, and in like circumstances and time, *again*, if the arterial action be not reduced, and the pulse low and soft. A solution of Epsom salts should be administered at the first bleeding, and an injection of the same with oil an hour after, and these should be repeated until the bowels are thoroughly freed.

Young animal whose immature strength are unable, like those of a coarse fibre, and with a poorer nourishment, to withstand the violence of disease, yet who still are exposed to the evils of high feeding and little exercise, should in some way be guarded against their injurious effects. "Prevention," says the proverb, "is better than cure."

To *prevent*, them.—Animals at all stages of growth should on being turned out into rich and luxuriant pasture, be moderately bled and physicked, and these should be repeated every three weeks or month. These precautions apply particularly to young cattle, which should be closely looked after, the last at night and the first in the morning; and, I may observe, instead of marring improvement they promote and secure it. Another excellent means is the seton, which inserted in the dewlap and carefully kept open and clean, establishes an admirable drain—a safety-valve in short, to the constitution.

Your correspondent in a former number who recommended his stimulating inoculation in the "*tails*," of stock, recommended upon the results of a practice of *twenty years*, nothing more than the successful treatment by *seton*. To the want of explanation in his notice of its mode of action, which possibly he, with others, might not understand, must I lay the blame in presuming to present you with this very imperfect essay. However, should it not be rejected, I propose returning to this subject, and to offer explanations in plain and comprehensible language of some of the more common diseases to which the inferior animals are liable; of their remedies; their mode of action; of the nature of the constitutions which they work; and to dispel according to my abilities, some of the clouds of ignorance which hang over this most interesting branch of medical science.

J. W. M'K.

[The insertion of seatons in the dewlap has been practised with much success by intelligent graziers, who do not altogether confine themselves to one pre-

cautionary measure. Mr. John Lawrence, who has published a very useful work on cattle, recommends short keep or an inferior piece of ground "as a digesting place," into which the cattle should be occasionally turned to empty and exercise themselves, but should the beasts be observed to advance rapidly, they may be bled monthly for some time; but as the disease appears to arise from over repletion, he (differing from our Correspondent), agrees with many other excellent authorities that occasional purges, or alternative medicines, should be also used.—ED.]

## PAROCHIAL GOVERNMENT.

(FROM THE ORIGINAL.)

In the article on government in my second number I have said that the only machinery by which the greatest moral improvement can be effected, must consist of local governments, so ordered that those who are most successful in the honourable conduct of their own concerns would be selected, and being selected, would be willing to give up time sufficient to superintend the affairs of their respective communities. By the most successful in the honourable conduct of their own concerns,—I mean those who by prudence, sagacity, integrity, and industry, attain independence at least, or being born to fortune, exhibit those moral qualities which make fortune a blessing to themselves and to those around them. Now in order to secure the selection of such persons, it is necessary that those who are to select, should have uppermost, or indeed solely in their minds, their own individual well-being; and that being the case, it must follow that they would choose the best qualified to serve their respective communities. This is a principle which, though probably in some degree anciently in force, has long since fallen into neglect; and the relation between the electors and the elected, in parishes as elsewhere, is now too slight to make the electors sufficiently careful in their choice. For instance, in any parish it is ordinarily matter of indifference, or nearly so, to the parishioners at large, whom they elect to govern them; and if they do interest themselves, it is only on some extraordinary occasion, or for some party purpose; but indifference is the rule. The reason is two-fold:—first, because the powers of government are much too small;—and secondly, because the elections are by too large masses. The remedy is also two-fold:—first, to divide every parish, if not already small enough, into such districts, that one individual, to be elected by each district, might be perfectly cognizant of its interests; and secondly, to give him such powers that those interests would be materially promoted or injured according to his qualifications for using the powers intrusted to him. Then each elector would have the strongest possible inducement to make a judicious choice:—first, because he would be one of a number sufficiently limited to make his vote of decided consequence;—and secondly, because he would personally and continually feel the good or ill effect of his selection. Now, the fittest persons to preside over the several districts would be also the fittest to be the governors of the whole parish, and therefore the self-interested feeling, which is the strongest and most constant, of each elector, would be made subservient to the interest of his community. This is what I mean, in my former article, by the words—"As the electors would come much into immediate contact with the objects of their choice, they would most likely—at least after a little experience—be more careful and discriminating than electors under other circumstances usually are. Mob-

flatterers, adventurers, and jobbers would be too nearly in view long to escape detection." Under such a system these characters must either mend their course, or sink into insignificance, to the great blessing of the country.

In the election of the heads of districts I should be inclined to give a vote to every man of competent age having anything like a settled inhabitancy, and I should make the elections annual. The elected should be the representatives of their districts, to all intents and purposes; the inhabitants delegating to them for the year the whole of their political power. Here would be the first step in a graduated system of representation—a principle absolutely necessary for the well-ordered government of a population so numerous as that of this country. The artificial system of electing electors is a false one; but here the soundest test is applied. The head of a district, besides being its representative in the parish, and its delegate every where, should be a peace officer with others under him elected like himself; should superintend the collection of rates; and should see to the enforcement of all laws relating to his charge—so that his attention to his duties, or his neglect or vexatious execution of them, would be felt by all within his jurisdiction. The evils arising from the present deficiencies of government might then be expected to vanish, and the effects of moral influence, the most powerful of all, would appear in their place. Division into organized districts would afford practicable fields for the well-disposed to work in, instead of the unmanageable and hopeless masses at present continually exposed to confusion and misrule. The consideration of the inducements to the most fitting persons to give up time sufficient to superintend the affairs of their respective communities, I shall defer till my next number. I will just add an observation of Dr. Johnson's as applicable to my doctrines. "I am a friend to subordination, as most conducive to the happiness of society. There is a reciprocal pleasure in governing and being governed."

## VICTORIA WHEAT.

The success of this wheat has been most complete in the island of Jamaica, and a prospect is thus opened of rendering our West India colonies less dependent than they have hitherto been upon the United States of America for that essential article of human sustenance, wheaten flour. By the Sheldrake Packet Dr. Hamilton has received an interesting letter from Dr. Bancroft, of which the following is an extract.:

KINGSTON, JAMAICA, July 9, 1835,—As you express in your late letters a desire to be informed as to the growth of various plants which you have been the means of introducing, I will now proceed to give you such particulars of several of them as I have been able to collect to the present moment.

VICTORIA WHEAT.—The Jamaica Society have received samples from three or four different places of the wheat produced there, all of which appeared to be of a favourable sort.

1st, From the mountains of St. Ann's, where the seed had been sown the latter end of January and the corn was ripe the latter end of April. In another part of the same district the dates of sowing differed from the above, but the wheat ripened in nearly the same period,

2nd, From the mountains of St. Andrews. On one property, Fair Hill, (2,000 feet above the level of the sea) the sowing and the ripening happened at the same dates as in the first mentioned case. Of this corn one grain produced twenty-eight ears, contain-

ing altogether fifteen hundred grains (being an average of fifty-three grains for each ear.) Notwithstanding this apparent success, the proprietor of the place thinks it unlikely that the planters would grow the Victoria wheat in preference to the great corn, as it is called here, that is the Zea Mayz.

On another plantation again, Charlottenburg (4,000 feet above the sea,) the seed was sown early in March, and received a top dressing, in the course of a few days it had already sprung up three inches above aground, and, as favourable and moderate rains continued to fall subsequently, the corn thrived well, and ripened in the early part of June, producing abundantly grain of a larger size than the parent seed: the ears being in general large and full. Six of these, for instance, yielded 336 grains, weighing three ounces, making an average of fifty-six grains, weighing half an ounce, to each ear.

The owner of this plantation, Mr. W. B. King, an Assistant Judge of Assize, and member of Assembly, has since sent me two bundles of the ears of his wheat, and I intend to inclose one or two of them as a specimen of the produce of the Victoria wheat here.

From the trial just made, Mr. King has no doubt that this grain could be cultivated in many parts of the island, and that it might become a profitable resource.

Such is the nature of Dr. Bancroft's highly important communication, which establishes beyond all possibility of dispute the practicability of cultivating wheat at elevations of from 2,000 to 4,000 feet above the sea, within the tropics—a fact of the first importance to our colonial interest, and not without its value as connected with our domestic wants. Now in those unfavourable seasons which have so often injured not only our English but our European harvests, generally producing the utmost severity of famine and distress, we may reasonably hope, by promoting the culture of this valuable grain in such parts of our West Indian settlements as admit of it, to have a source of supply within ourselves, placed beyond the dangers of injury from the capriciousness of European seasons. To Sir Robert Ker Porter, whose patriotic exertions have contributed so much to the solution of this important problem, a large debt of gratitude is due, not only by the inhabitants of our West India islands but of Europe generally; and we only hope his generous exertions may be appreciated as they deserve. We could have wished for information as to the mean temperature of the months during which the wheat was growing—the degree of atmospheric humidity during this period—and the number of inches of rain which fell. It would also have added to the interest of the account, had the previous days of sowing and reaping been specified; as it is, however, Dr. Bancroft's account strikingly confirms the truth of Baron Humboldt's statement of the shortness of the period required for the maturation of harvest. Wheat sown about the middle of October, ought, in favourable seasons, to be fit for reaping by the middle of January; the same ground re-sown immediately, and well limed and manured, would yield a second crop in the beginning of April, a third in the month of June, and a fourth (if the hurricane months did not interpose) in the month of September or beginning of October.

**PARISHES.**—Parishes are so many little commonwealths, capable in different degrees of being made by effective organization nurseries of useful ambition, manly intelligence, and social virtue. It is here that public men should begin their discipline, cultivate their sympathies, and learn to see their way. It is here that the lowliest citizen should proudly feel within the

reach of merit the first step to advancement. It is from this goal that all should have a fair start, and the State place her sons in their proper order. Then might representation be the extraction of the choicest of the land, legislation become something like the essence of wisdom and simplicity, and police an ever vigilant force having for its chief characteristic moral influence. —*The Original.*

## THE CORN LAWS.

(From the *New Statistical Account of Scotland*).

BY DR. SINGER, OF KIRKPATRICK JUNCTA.

The most threatening obstacle to agriculture in Britain is the dangerous and erroneous idea that poor soils ought not to be cultivated. Now, about three-fourths of the corn lands of Britain were poor soils at one time, and some of these have become rich by manures and culture; and to what subject is it possible to apply capital and industry to more advantage than the improvement of barren moor and moss, turning the former into cultivated fields, and the latter into meadow? The most useful employment is here conjoined with the means of obtaining subsistence for the labourers, as well as for the community; and the permanent returns from, and value of, land, are steadily advanced. The last corn law, by admitting grain at all times, and letting it out when the prices are high, has prevented all cause of alarm, and has also preserved the prices at a moderate and rather equal rate, allowing them even to fall too low. The rash project of abolishing this law, trusting to foreign supplies, and throwing the poor lands out of cultivation, is fraught with ruin to the capital, the industry, and the resources of the kingdom. Let the currency be made safe, but allowed to circulate in sufficient abundance, let the land produce, as well as the manufacturing produce, be duly protected, and let the corn laws encourage a liberal and extended cultivation; and, in the nature of all things, all classes will find the benefit. Then give a preference to home produce in the granaries and markets of the kingdom, and it will become plentiful and cheap also; but let foreign produce pay duty, when imported, and the merchants will purchase *home-grown*, as well as *foreign corn*. The dread of constant and speculative interference with that industry, which it requires long time to establish—indeed the very proposal of interference made by men in public office or station, and not discouraged, has a most pernicious effect on the public mind. It paralyzes industry, deranges improvement, withdraws capital, and renders experience and skill of little use.

The Annual Show of the Northamptonshire Farming and Grazing Society took place on Wednesday Sept. 9, at Brampton. The weather was fine, and the show of cattle extremely good. The sheep, in consequence of the long drought, were not so remarkable as in former years. Some variations from the former mode of conducting the business of the show it may be as well to mention. The Judges commenced their duties on Tuesday at eleven o'clock, and the awards, with the exception of those for extra stock, were all made on that day. No persons attended the examination of the cattle for this purpose but the President, the Stewards, and the Judges, and the awards were delivered to the President, and not declared to any person until one o'clock on Wednesday. Ample time was thus afforded for the speculations of the public. The Judges were wholly unacquainted with the ownership of the cattle, and their decisions were distinguished by numbers. The various ownerships were not declared till the following morning.

## LAW REPORT.

## HOUSE OF LORDS.—APPEAL.

LIEUTENANT-COLONEL GORDON V. ANDERSON AND OTHERS.

The action in this case, which gave rise to the present appeal, originated in the Sheriffs' Court, at the instance of the appellant, against the respondents—he being landlord, and they tenants—to compel them to use the fodder of the away-going crop upon their farms, in conformity with this article in the lease—viz, “the whole fodder to be used upon the ground, and none sold or carried away at any time, hay only excepted, and all the dung to be laid on the farm the last year of the lease.” It was maintained by the landlord that the tenants were prohibited by that article from selling or carrying away, at their removal, the straw of the way-going crop; whilst on the other hand it was insisted for the tenant, that even if the conditions were binding upon them, which they disputed, the obligation did not extend to the straw, which they said it was never meant or understood to include. The Court below held that the respondents were justified, having disposed of the straw, and the landlord brought the case to the House of Lords.

Lord BROUGHAM recommended their Lordships to affirm the judgment pronounced below, and with costs.

Judgment affirmed with costs.

## LINCOLNSHIRE ASSIZES.

HUTTON (ROBERT) V. WARREN (REV. WM.)

Plaintiff is a farmer at Wroot, of which parish the defendant is Rector: the action was to recover 95*l* for tenant-rights on quitting the glebe farm belonging to the defendant. The declaration set forth that the plaintiff was tenant of the farm, which he undertook to cultivate according to the rules of good husbandry, and that on leaving he was entitled to his tenant-rights according to the custom of the country. The defendant put four pleas upon the record: 1st, that he had not promised to pay; 2dly, that the plaintiff was not tenant according to the terms set forth; 3dly, that he had not cultivated the farm according to the rules of good husbandry; and 4thly, that according to the custom of the country he was not entitled to the tenant-rights he claimed. In his replication, the plaintiff negated all these pleas, and upon this issue was joined.

Mr. Humfrey stated that the plaintiff had been tenant of the glebe farm for upwards of 20 years, under the Rectors of Wroot: until 1832 the Dean of Banger was Rector, but in that year his son, the present defendant, succeeded to the living; and at Michaelmas 1833 the plaintiff received notice to quit at the next Lady-day. He did quit then, and he now sought to recover compensation for seed and labour, and the value of the crops he left upon the farm, which he was bound, according to the rule of good husbandry, to sow. Mr. Warren thought fit to deny that the plaintiff was tenant upon the terms mentioned; and, to the learned counsel's astonishment, had put upon the record a plea that he was not entitled to anything for the value even of his seed and labour. According to honesty, he ought to be; and he should satisfy the Jury that, according to the custom of the country, he was. At the time of the notice being given, an interview took place between the plaintiff and Mr. Capes, attorney for the defendant, at which the reverend gentleman was present, when some discussion took place about the next year's crops, which the plaintiff refused to sow: Mr. Capes said, “Won't you? but according to the custom of the country you will be compelled to do so.”

So that the defendant first insisted that the plaintiff should sow the land, according to the course of good husbandry; and then he said, according to the custom of the country, you are not entitled to be paid for it! This, certainly, was not a very righteous proceeding. Although the defendant had denied by his plea that the plaintiff was entitled to be paid for his tenant-rights, he had actually applied to the valuer who was ultimately employed by the plaintiff, to value that right. The learned counsel, in conclusion, said he had no wish to enlist the prejudices of the jury in the cause—the claims of the clergyman or of the farmer were equally entitled to their impartial attention; but it was to be lamented that differences had arisen, and that this defendant had first distrained upon the plaintiff's property, and then commenced two actions which he had not ventured to proceed with.

George Hutton, son of the plaintiff, proved the defendant's hand-writing to the notice to quit, which was dated 11th Sept. 1833. The Rectory farm was under 100 acres of land; witness's father quitted it on the 25th of March, 1834, after having held it for 22 years. The defendant came to the living about three years ago. In October, 1833, my father and I went to Mr. Capes' office at Epworth; Mr. Warren also came. My father asked if they would allow him for the crop of the seven-acre close if he sowed it—it wanted sowing. Mr. Warren said he should have nothing to do with it, he left it all to Mr. Capes. Mr. Capes said, “the custom of the country will compel you to sow it, and keep the farm in a regular course.” A few days afterwards a letter came from Mr. Capes to my father. [The letter, which was dated 31st Oct. 1831, stated that the writer was authorised by Mr. Warren “particularly to caution the plaintiff against committing waste or injury, or neglecting to cultivate the land in due course of husbandry.”] The farm was cultivated according to due course of husbandry. The seven-acre piece was sown in November, the proper time, with blend-corn (wheat and rye mixed): if it had been delayed till after Lady-day there would have been no chance of a crop. A piece of six acres and a half was sown with barley in March, not long before we quitted; that is the time for sowing barley at Wroot. There were four and a half acres of clover which had been sown in March 1833; it is a two-years' crop, and would be fit to cut in July 1834. Mr. Charles Capes, brother to defendant's attorney, succeeded my father as tenant of the land, and reaped all the crops.—Cross-examined: The barley was sown not so much as a fortnight before we left: we quitted on the 25th March; my father did not hold over: he removed to a farm of his own in the parish, and to his own house. He quitted the parsonage-house in April, but I cannot say what time; but the land he gave up on the 25th March. My father gave up to Mr. Capes part of the house to put his furniture in, and only occupied it himself until he had time to remove his furniture: he gave up possession of the land to Mr. Capes and his brother on the 25th March: they came to demand possession of it. I remember an action of ejectment being brought against my father, and also that there was a distraint for rent.—Judge: A very unfortunate ending of a twenty-two year's tenancy.—Re-examined: I am sure all the corn was sown before the 25th March.

Wm. Simpson, land-valuer, of Loversall, near Doncaster, about 12 miles from Wroot: I know the custom of the country: on field land (old inclosure) the out-going tenant recovers his full tillages. I have been over the farm: was first employed by Mr. Hutton, sometime in the summer of 1833, to value his tenant-rights—his quitting claims: and some-

time afterwards Mr. Warren applied to me for the same purpose. The farm appeared to me to be cultivated and cropped according to due course of husbandry, and to have been managed very well. For the  $6\frac{1}{2}$  acres of barley I allowed 46l 4s 4d; the 7 acres of blend-corn, 41l 8s 8d; 4 acres of clover-seed (small seeds and sowing) 2l; seeds on the common 6l 4s 6d. I consider that a fair allowance from landlord to outgoing tenant. I have been employed by Mr. Warren to value tithes in Wroot, and have valued in that parish for 15 years. The custom upon which I have valued the tenant-right has prevailed for 20 years.—Cross-examined: My notions of the rights of outgoing tenants are governed by the terms on which they entered: I always valued a tenant out on the same terms as he entered, if the entry was sanctioned by the landlord or his agent. When the incoming tenant has paid nothing, he certainly is not entitled to be paid again. The tenant is bound to leave the manure, if the landlord will take it at a valuation: that is the custom of the country. 95l 17s 6d is the total claim according to my calculation.

The Judge asked whether this matter had not better be referred: the relation of landlord and tenant was at an end between these parties, but that of pastor and parishioner subsisted; and was it not advisable, on that account, to leave the decision of the matter to some indifferent person?

Mr. Balguy, for the defendant, said neither his client nor the attorney was here: Mr. Capes was ill, and another gentleman was conducting the cause for him: under these circumstances, he was not authorised to adopt his Lordship's suggestion.

Cross-examination resumed: I valued the tenant-right two ways: by one mode—that of "emblements"—I made it 99l 17s 6d. My first valuation was only 90l, but that was made immediately after the seed was sown; the valuation of 95l 17s 6d was made on a view of the crops in the following July.

Mr. Balguy here intimated that Mr. Warren had come into court, and would accede to his Lordship's suggestion: but Mr. Humfrey declined: the jury he thought were the very best arbitrators in a matter of this sort—it was one on which they had greater knowledge than any gentleman of the bar could have.

Mr. Richard Tilburn, land-valuer, of the neighbourhood of Wroot, confirmed the fairness of Mr. Simpson's valuation.—In cross-examination, he said there were cases in which an off-going tenant would be entitled to compensation for his tenant-right, even if he had not paid anything on entering.—Re-examined: If the tenant had been so long upon the farm that there was no evidence whether he had paid or not, he would be entitled by the custom of the country.

By the Judge: If there is a general custom that an out-going tenant should be paid, it would be presumed that he had paid on entry, unless that presumption was contradicted by evidence.

Mr. Balguy, for the defendant, complained of his learned friend's having forfeited his pledge of not endeavouring to enlist the prejudices of the jury in the cause, and said under those circumstances it was right that the jury should know on what terms the plaintiff had quitted this farm: the defendant had been obliged to bring an action of ejectment, because the plaintiff persisted in over holding; and he had also been obliged to distrain for rent: it was on that account, and that only, that the defendant had refused to continue him as tenant. It had been opened to them that Mr. Simpson had been employed by the defendant as well as by the plaintiff to value this tenant-right; and undoubtedly if the fact had been so, he should have felt it press heavily upon him,

because it would have been an admission by the defendant that the plaintiff had a claim for some tenant-right.

The Judge said the evidence certainly was to the effect that Mr. Simpson had been applied to by both parties.

Mr. Balguy said he had been employed by the defendant merely to value tithes.

The Judge repeated that the evidence was that Mr. Warren had also applied to Mr. Simpson to value this tenant-right.

This was confirmed by Mr. Simpson's being recalled; and by the production of a letter from Mr. Warren, in which he complained of Mr. Simpson's not having apprised him that he considered himself retained by Mr. Hutton.

Mr. Balguy: The case being so, I am bound to admit that Mr. Warren at that time appeared to believe Mr. Hutton had some claim; he had, however, only recently come into possession of the living, and was not acquainted with all the facts: but if he had since discovered that Mr. Hutton had no claim, he was of course at liberty to resist this action; and in the course of the proceedings he had discovered that Mr. Hutton was holding under a lease which had expired by time. It was dated 1811, and was for six years: at its expiration no fresh contract was entered into, and he (Mr. Balguy) took it to be a clear point of law, that where a tenant under a lease continued his tenancy after the lease had expired, without any fresh contract being entered into, he was considered as holding on the same terms as were imposed by the lease. That was an established principle of law; and therefore the custom of the country would in this instance be superseded by that lease. He admitted that ordinarily, where there were no specific terms imposed in a lease upon any particular matter, as to that matter the custom of the country would still prevail—where the lease was silent the custom of the country spoke: but in this case there was a specific condition imposed by the lease, which showed that the holding was not to be in any matter subject to the custom of the country. The lease expressly declared that the tenant was to consume three-fourths of the hay and straw upon the land, and convert it into manure; and that so much as should not have been put upon the land at the time of the tenant's quitting, should be left for the landlord's use. Now that was perfectly accordant with the custom of the country; and if the parties had intended to be governed by the custom, such a specific condition in the lease was unnecessary. The fair inference therefore was, that the parties intended in no instance to be governed by the custom, but only by the terms of the lease; and as that instrument was wholly silent upon the tenant-right, he contended that this action could not be supported: the parties had nothing to do with the custom of the country, but only with that written agreement. But even if it were otherwise, he should be able to show that the custom of the country was not as had been represented: the custom was that as a tenant entered so he should quit; if he had paid when he entered, he was entitled to receive when he quitted; and if he had not paid, he was not entitled to receive. The plaintiff had not proved that he had paid; he might have proved it, if he had; and as he had not done so, it must be presumed that he had paid for no tenant-right.

Thos. James, parish-clerk of Wroot, proved the signatures to the lease which Mr. Balguy had put in.

A question was raised as to the stamp on the lease, which was 1l 10s: the rent reserved was 350l, but the lease being under the 48th George III., the stamp was found to be correct.—A long argument

also took place upon the point whether this lease being silent upon the point of the tenant-right, the custom of the country was let in; or whether the lease was to be conclusive, and so leave no question for the jury.—The Judge said he should hold that the custom of the country was operative upon those points on which the lease was silent; but he would give leave to the defendant to move for a nonsuit, in case the court above were of a different opinion.—Mr. Humfrey said he must reserve his right to object that this lease was binding upon the plaintiff, it having been made with a previous landlord, and not with the present defendant.

Robert Bunby, of Wanworth, deposed that his uncle was tenant of the glebe farm at Wroot before the plaintiff; did not know that his uncle received for the tenant-right.

Mr. Humfrey here produced a receipt for 50*l* paid by the plaintiff "for manure, seeds, and wheat sown," dated in 1811, signed Mary Bunby, the widow of the witness' uncle, and whose signature the witness proved to be her writing.

Mr. Balfour, after a conversation with the defendant, who was in court, said this document came by surprise upon him—it had never been communicated to him before; and as far as the value of the seed and labour was involved, he was willing it should be so taken, subject to the question reserved as to the lease.

This reduced the point in dispute to a question of amount—the defendant valued the seed and labour at 27*l* 7*s* 6*d*, denying the right of the plaintiff to the value of the crop of wheat, which was included in Mr. Simpson's estimate of 95*l*.

Mr. Simpson being recalled, said the custom of the country was to give the full value of the outgoing crop, after deducting a year's rent, assessments, and the tithes (if any were payable): for seeds they only estimated the labour and the cost price of the seeds.

Mr. Peter East, farmer, of Epworth, had valued the seed and labour only, at 27*l*; but in cross-examination he admitted that it was customary to allow the value of the crop of wheat, and that Mr. Simpson had so valued for him (Mr. East) as outgoing tenant. A valuer named Winter made a similar admission.

Mr. Balfour addressed the jury upon the receipt that had been put in, and contended that it was clear from the sum that in 1811 (when corn was of high price) the plaintiff on entering had paid only for seed and labour.

Mr. Humfrey, in reply, said that he had no wish to excite prejudice as had been imputed to him, but it was quite clear that his poor client was by no means a match for the clergyman and the lawyer together, for the jury would remember that the brother of the defendant's attorney was the incoming tenant; and whatever the landlord allowed to the outgoing, the incoming tenant would have to refund. Great part of his friend's speech had been occupied in complaining what a wicked man Mr. Hutton was, in wishing to receive for a tenant-right when he had never paid anything. But when he produced a receipt proving a payment to the previous tenant, then it was said, "Oh, but it was only for seed and labour!" Why it was proved by the defendant's own witnesses that it was the universal custom at Wroot to pay for the crop; and he could not understand why this glebe farm was to be an exception to the rule, unless it was that the incoming tenant was the brother of the attorney. The argument as to the amount paid in 1811 was most fallacious; they had no evidence of the number of acres of corn, and they all knew that that number varied every year.

Mr. Simpson, being recalled, said he did not know

that any difference was made as to glebe farms; and Mr. Tilburn said he had valued between the outgoing tenant of the glebe farm in the adjoining parish, and had given the full value of the crop.

The Judge, in summing up, briefly remarked that the only question was whether the tenant was entitled to receive for the crop.

Verdict for Plaintiff, damages 95*l* 17*s* 6*d*, the Jury remarking that that was agreeably to Mr. Simpson's valuation.

Mr. Balfour signified that he should apply to the court above.

## OXFORD CIRCUIT.

### IMPORTANT TO LANDLORDS AND FARMERS.

PIGOT *v.* BIRTLES AND ANOTHER.

Mr. Sergeant TALFOURD (with whom was Mr. WHATELY) said, this was an action brought by an industrious pains-taking farmer, against his landlord, for a long continued series of oppressive, illegal, and most harassing and ruinous conduct. Mr. Pigot was a tenant of Bostock Hall Farm, near Wixall, in the parish of Prees, under a lease from a gentleman named Becket, at the yearly rent of 285*l*; payable half-yearly. He continued to pay his rent with the greatest punctuality, and to work his farm in a manner which did him honour. In 1833 Mr. Becket died, and was succeeded by the defendant and others as trustees of the farm in question. It would be proved that the rent due at Lady-day 1834 was paid on the 14th of the ensuing April; and that the half-year due on the 28th of September was paid on the 29th of the same month; yet all of a sudden, without any notice,—on the 27th March 1835—only two days after the Lady-day rent became due, a distress was put into the plaintiff's premises,—his whole stock and effects were taken in execution—the beasts at the plough were seized, although there was on the premises thrice more than would have satisfied the distress; and no remonstrance from the Plaintiff received any attention. But the prosecution did not cease here. On the very day after the sale took place, a second distress was made on the same premises, and every thing carried off, and sold under that distress at less than half its value, although there was twice as much taken under the first distress as would have satisfied all claims. The defendant, however, had become aware of the illegality of his proceedings, and had paid 60*l*. into Court to satisfy the plaintiff for the oppressive result of his second distress. But it would be proved that a much greater injury was inflicted than that sum would cover; and as the law gave to the sufferer double the value of all goods illegally distrained, the Plaintiff came before a jury of his country to claim their protection against such oppressive conduct. He complains that an excessive distress was levied on his premises; that the beasts of the plough were illegally taken under that distress, when there was enough besides to satisfy it; that the goods were not appraised before they were sold; and that they were sold at not the best market; that there was no rent due when the second distress was made; and therefore that double the value of all sold under it ought to be repaid to the Plaintiff.

The receipt for the half year's rent due on the 29th of September 1834 was put in; it was dated on the 30th.

J. Downes, servant to Mr. Pigot, proved his occupation of Bostock Hall, which consisted of 175 Acres.

On the 27th March last, a distress was made on the farm. There was a stack of hay on the farm of 20 tons, worth 4*l.* a ton. There was thirty acres of capital growing wheat, which would produce on an average twenty-five bushels an acre, at 6*s.* per bushel. The two plough mares were taken, worth 26*l.*; and other goods to the value of 17*l.* 2*s.* 6*d.* The hay, which was worth 80*l.* was sold for 52*l.* to the Attorney's Clerk; and no account of the proceeds was rendered to Mr. Pigot. The day after the sale heard voices about the yard, and next morning found that the Bailiffs had again taken possession of the horses in the stable, and other things bought in at the previous sale. These were sold at Whitchurch. Their value was 74*l.*

Cross-examined.—Pigot owes me about 20*l.* of wages. The farm had been let out as a ley in 1834, and was advertised to be so let this year. There was a sale on the premises on the 14th of March 1835, a few days before the rent became due. There was upwards of 100 acres of the farm in grass. The Sheriff's officers were on the premises in 1834. He kept the officers out of the dwelling-house in 1835, by making all the doors and windows.

Re examined.—Taking in cattle to ley is a good thing for land. Mr. Pigot gave up dairying, and sold his dairy utensils. That was all the sale he made on the 14th of March.

Charles Pigot, son of the Plaintiff, gave similar evidence; as did his brothers. On their cross-examination it was admitted that in December 1833 a distress was put in for rent, owing to a great deal of expense plaintiff had been put to in conducting an action for his landlord, who dying in the mean time, his trustees refused to reimburse him one farthing. There were two sales on the farm in January 1834—one for rent and another under an execution from a Mrs. Cliff who had lent plaintiff the money to pay the costs of the action.

Thomas Hughes, apprentice to Plaintiff, proved being ordered by the officers to return the horses to the stable after they were geared for the plough on the 28th of March. In his cross-examination he said, this is the third year a white crop has been taken of the fields where the wheat is now growing. A wagon, a tumbril, and other things were sold on the 14th of March, as well as the dairy vessels. Pigot had no cattle of his own on the farm; formerly he used to have as many as 20 or 30, besides sheep. The cattle put in to ley, were all taken out on the 28th of September, the day before the Michaelmas rent became due. The doors of the house were all made whilst the officers were in possession; and a sort of basket was made of the cheese fillets, with which they wound the inmates up through the window.

Henry Pigott proved that the whole of the things taken under the second distress were worth 74*l.*, but were sold for 36*l.* That 17 acres of the farm had been drained, and seven irrigated at Pigot's own expense.

Mr. Sergeant LUDLOW, for the defence, was in a condition to prove that no illegality had been committed, except in the second distress, and for which 60*l.* had been paid into court. The facts were, the Plaintiff, who had been repeatedly distressed, both for rent and other debts, had turned the chief part of his property into money ten days before his rent became due, and never offered to pay one farthing of that money to his landlord. There was next to nothing left on the farm on which to make a distress,

except the growing crops, and these were on the 27th of March not in a condition to be sold. All that the goods taken under the first distress brought was 17*l.* 7*s.* besides the hay, making only 71*l.* 7*s.* towards 142*l.* 10*s.* If the defendant had been a cruel landlord, he had ample means of gratifying himself on a tenant who had for three years successively raised a wheat crop from the same land; but he was quite of an opposite character, and behaved generously and kindly till he found every thing going off the premises, and no attempt made even to conceal that the Plaintiff's object was to permit nothing to remain from which the rent could be raised.

Mr. Justice WILLIAMS.—The chief question for the Jury is, Have the defendants distrained more than was their due? for that question involves all the others; the answer to that question will mainly depend upon what value you put on the growing crops. Although the hay is valued at 4*l.* a ton, yet it is proved the auctioneer did his best in selling it; and in that case the defendants are not bound to make good the difference. If you think the value of growing wheat in April is much the same as it is in August, then you may take some sort of an average, say twenty-five bushels to the acre, and valuing the thirty acres at five shillings a bushel, you will have 220*l.*, which was considerably more than the rent due, and therefore rendered unnecessary and therefore illegal the taking of the beasts of the plough. But if you think the growing wheat a speculation, and that its value at the time the distress was made was less than, with the other things would make up the rent and expenses, then the defendants have done nothing wrong, and you will give them a verdict. Under the second distress it is proved the goods were sold for 36*l.*; they were valued by the plaintiff at 74*l.* Your verdict will say which sum is nearest their value. The defendants have paid 60*l.* into court, being 24*l.* more than the goods fetched. You will give your opinion if that is sufficient to reimburse the plaintiff for that distress, and if not, you will give him double the value of the goods thus taken under that distress. But your chief enquiry will be as to the value of the growing wheat, which decides all the other points.

The Jury retired for a considerable time, and returned into Court with the following verdict for Plaintiff:—

We find the value of the growing wheat on the 27th of March to be 190*l.*

We find 100*l.* damages for the excessive distress.

We give 10*l.* damages for taking the beasts of the plough.

We give 100*l.* damages, as double the value of the goods taken under the second distress.

We find that the goods were made the most of at the sales.

A Verdict was entered for the defendant on the other counts: and his Lordship gave the defendant leave to move the Courts above to enter a verdict for the defendant on all the counts, if it should be found that he had improperly left it to the Jury to put a value on the growing wheat.

A Verdict was then recorded for Plaintiff.—Damages £210.

#### IMPORTANT TO PURCHASERS OF HORSES.

Saturday se'nnight, at the Lewisham Petty Sessions, Mr. Marshall, proprietor of the Potteries, Tanner's-hill, Deptford, was summoned by Mrs. Martyn, of Chislehurst, for having in his possession a valuable bay gelding, her property. It had been stolen in May last

from the complainant, and no tidings were heard of it till a few days ago, when her coachman saw it grazing in a field of Mr. Marshall's. It appeared, from the evidence adduced, that Mr. Marshall had purchased it from Mr. May, a respectable horsedealer at Deptford, and that he (Mr. May) had bought it at Hertford fair in May last of a person whose name he did not know, but whom he had been in the habit of meeting at the different markets. The magistrates said that the horse having been proved to have been stolen, it must under these circumstances be given up to the owner. Mr. Parker, the magistrates' clerk, read several clauses in the Act of the 2d of William and Mary, in which it was enacted—"That it should not be lawful to purchase any horse, mare, or gelding, at any fair or statute market, unless such animal had been publicly paraded up and down such market or fair for one hour at least; and that the purchaser should require the seller to go before the clerk, or person appointed to take toll, who should there enter the name and address of the seller in a book to be kept for that purpose, and if such seller were not known to such clerk, the seller must produce one credible witness to speak to his knowledge of the seller; and the clerk should also take one special mark on such horse, so as to enable him to identify the same; and that the purchaser should take a certificate of the entry thereof from such clerk, under a penalty of 5*l*.; and in default of his producing the same, if the horse should be proved to have been stolen, a justice of the peace should be empowered to order the restoration of the animal." Mr. May said that none of these regulations were observed at horse-fairs, and that no registers were now kept. The magistrate replied, that, though the custom might be obsolete, the law was still in force.

### HOP PLANTING.

NORFOLK.—The inhabitants of this district are aware of the obligations they lie under to Richard Crawshaw, Esq. since his residence at Honingham, for the impulse his science and example have given to Horticulture in general, and especially to the cultivation of grapes both within and without doors. From his simple yet extraordinary application of the principle of growing single stems in a sufficient space of earth made permeable to air and water in the greatest possible degree, almost every vine-grower in Norfolk and Suffolk, gentle and simple, the possessor of the forcing house or of a garden wall, has learned to produce grapes with certainty and regularity—the vines look more like fruit hung by art than the natural product, so exactly do they spring from the spurs, while they reach a far greater perfection, and last not least, are become so plentiful that price is greatly reduced. Taking this special instance, together (we repeat) with the impulse given by his success to Horticulture generally, we have never known any public improvement so rapidly propagated over the entire district.

Mr. Crawshaw has now turned his attention to the introduction of the growth of Hops into Norfolk. This hardy though uncertain plant is now and then seen in the county upon the hedges of cottage gardeners, and there was within our recollection a plantation of some extent at Blofield Globe. This however, we believe, was given up when the original former of it died, and hops cannot be said to have made any part of the agriculture of Norfolk. The general belief has been that the soil is not adapted to their production. Mr. Crawshaw thinks otherwise, and he has selected, with his own hand, from the best grounds in Kent, both cuttings and plants sufficient for two acres. Nothing could be more unfortunate than the season. During their selection and transit, a cold drying wind did them serious injury, and the total failure of rain,

together with a blighting south-west wind, has materially impeded their growth, to speak in the most favourable terms. Notwithstanding all these evils, the bine is strong and has reached a height which the Kentish cultivators neither expect nor encourage during the same period of growth. Mr. Crawshaw, it is to be explained, proceeds upon his own plan, trusting to the general principles of vegetation rather than to the routine of the Kentish growers, and he feels so certain of success, even under the very disadvantageous circumstances that have attended the commencement of his experiment, that he has prepared about nine acres more ground for the enlargement of his hop garden next year.

The place selected is a valley sheltered on all sides except the south-west—the soil a sandy loam. We have visited the spot, and can confirm by our own observation the particulars above stated. We can but consider the experiment to be exceedingly important, not only to Norfolk but to the country, since if successful, it will have no slight effect eventually upon that almost monopoly which the hop-counties (as they are now called) enjoy, by introducing them into more general culture, and thus add to the means of the farmer by extending his views and objects. Mr. Crawshaw's indomitable energy and indefatigable attention to what he undertakes, his thorough acquaintance with the principles of vegetable nature and the science of gardening, may well lead to the most sanguine hopes that he will prosecute to perfection this new attempt, and lay another and more valuable obligation than he has already conferred upon his neighbourhood and the public.

TRAFFIC ALONG HOLBORN-HILL.—"I have ascertained (says Mr. Wishaw, in his pamphlet on the Holborn-hill improvements) from repeated observations which have been made for me, that the annual traffic along this line is upwards of 20,000,000 of pedestrians, 87,640 equestrians, 372,470 carts and waggons, 78,876 stages, 157,752 hackney-coaches, 82,258 carriages, 135,842 omnibuses, 460,110 chaises and taxed cabs, 354,942 cabriolets." Surely this immense traffic requires something for its improvement, such as Mr. Wishaw and others have recommended; such as a viaduct, to avoid the ups and downs of the way from Holborn to Cheapside.

PLYMOUTH. — SMUGGLED CORN. — The *Gulnare*, Laurens master, a Jersey trader to this port, is detained on account of having a quantity of tobacco, spirits, and tea on board. The master is out on bail; the crew are in confinement. To the uninitiated it has long been a matter of surprise that this vessel and others of her class should make a trade of fruit, &c., from Jersey, answer their purpose. It is said that foreign wheat has found its way to this port, contraband *via* Jersey, and it is not a little strange that the parties connected with the *Gulnare* are those who have been the loudest in condemning the evidence on this subject of a highly respectable gentleman in the corn trade at this port.

FREE TRADE.—"But how about the free trade cry?" Why, friend, 'tis beautiful in theory, but in practice, death! It means neither more nor less than "no dividends" to the fundholders—"no rents to the landlord"—"no profits" to the farmer, manufacturer, or shopkeeper—"no wages" to the labourer. It means "cheap corn," and no money to buy it with.—*Oastler's Letters to the Duke of Wellington.*

market.

## REGULATIONS FOR THE VETERINARY COLLEGE.

1. The establishment shall consist of a society  
and school, to be called the Veterinary College.2. The business of the society shall be con-  
ducted by a president, twelve vice-presidents,  
twenty-four directors, and a treasurer, forming a  
a council; in whom shall be lodged the whole  
executive power of the college, subject to the con-  
trol of the members at large in general meetings.3. The president, vice-presidents, and treasurer,  
shall be chosen annually. The twenty-four direc-  
tors shall be divided into four classes; one class  
shall go out each year, and six directors be elected  
in their place. No director shall be re-elected till  
after the intervention of one year.4. Ten members shall form a quorum at a  
general meeting, five a quorum of the council, and  
three a quorum of the committee.5. Five auditors shall be annually chosen, three  
of whom shall not be of the council, nor on any  
committee.6. The 18th of February being the day on which  
it was resolved to establish a Veterinary College,  
shall be the anniversary; on which day the sever-  
al officers of the college shall be elected, and themembers invited to dine together, unless it shall  
happen on a Saturday or Sunday, and in that case  
the meeting shall be held on the Tuesday follow-  
ing.7. Four quarterly general meetings shall be  
held in the year: viz., on the first Tuesday in Fe-  
bruary, the first Tuesday in May, the first Tuesday  
in August, and the first Tuesday in November; at  
which meetings the minutes of the last quarterly,  
and all subsequent general meetings, shall be read.8. No regulation shall be altered or repealed,  
nor shall any new regulation be enacted, but by  
the consent of two-thirds of the members present  
at two successive quarterly meetings; and every  
proposed regulation, alteration, or repeal, shall,  
after the first meeting, be fairly written, and exhi-  
bited in the council room, for public perusal and  
consideration. This regulation shall extend also  
to the removal of any of the officers of the college,  
whose salary shall amount to £150 per annum or  
upwards.9. A discretionary power shall be lodged in the  
council, by which they may, in cases of emer-  
gency, or where the advantage of the institution is  
evidently concerned, make orders, which shall  
have the force of regulations, till the next quarterly  
meeting, when they shall be submitted to the de-  
termination of the meeting.10. Any sum, not less than two guineas, shall  
be a qualification for an annual member, and not  
less than twenty guineas for a perpetual member.11. No person shall be entitled to debate or  
vote at any meeting who has not been a member  
six calendar months, nor until his subscription for  
the current year and all his arrears are paid; and  
no person shall be entitled to be present at any  
meeting whose subscription shall be two years in  
arrear.12. At all elections, peers, and members of par-  
liament, and ladies, (having been subscribers six  
months,) shall be allowed to vote by proxy; such  
proxy being a member of the college.13. All elections shall be by ballot, and shall be  
determined in one day, between the hours of  
twelve and three o'clock. The president, vice-  
president, treasurer, or such other member as shall  
be in the chair at any general meeting, council, or  
committee, shall, in all cases of equality of votes  
or ballot, have a double or casting vote or ballot.14. No member who shall, in any manner, directly  
or indirectly, derive any advantage, profit, or emo-  
lument, from the funds of the college, or who shall  
be charged by the college, with any office whence  
such profit shall accrue, shall be elected into the  
council: and any member of the council so re-  
ceiving shall immediately vacate his place. Nor  
shall any member who receives any advantage or  
emolument from the college be chosen or continue  
on any committee.15. No officer or servant of the college shall  
presume, under any pretence whatever, to accept  
of any present or gratuity from any member, or  
from any tradesman or other person having deal-  
ings with the college, on penalty of dismissal.16. A volume of the transactions of the college  
and school shall be published annually, and de-  
livered to each subscriber or his order, at the  
college, gratis.

17. A medical experimental committee shall be chosen, who shall meet occasionally for the purpose of suggesting and making experiments, with a view to throw additional light on the animal economy, and to ascertain the effects of medicines upon different animals, to be procured for that particular purpose; and for inspecting the drugs and medicines bought for the use of the infirmary.

18. A professor of veterinary medicine shall be appointed, whose appointment shall be subject to rule No. 8.

19. A secretary shall be appointed, whose appointment shall be subject to rule the 8th.

20. A collector shall be appointed, whose appointment shall remain during the good conduct of the officer.

#### THE PRESIDENT

Shall preside at all meetings of the college, and shall have the power of convening a special general meeting, giving ten days notice to the members, by advertisement, in two or more morning papers.

#### THE VICE-PRESIDENTS,

In the absence of the president, shall preside at all the meetings of the college, in the rotation of the list; and any three of them are empowered to convene a special general meeting in the same manner as the president.

#### THE COUNCIL

Shall meet the first Tuesday in every month, and as much oftener as shall be found necessary.

A superintending committee shall be chosen, who shall meet every Tuesday to receive the reports of the officers, and to examine into the state of the college. This committee shall consist of three of the directors, who shall attend in rotation, and who shall receive notice thereof from the secretary on the preceding Monday. This committee shall be open to any member of the college.

Such directors as shall not attend, in one year, four councils, or shall not have attended in rotation the superintending committees, or engaged other directors to attend for them, shall vacate their places as directors, and, at the annual election, others shall be chosen in their stead into the classes they belong to.

Any six of the directors are empowered to convene a special general meeting, in the same manner as the president or three vice-presidents.

If a requisition for a special general meeting be signed by nine members entitled to vote, and the business declared in the requisition, the president, vice-presidents, or directors, shall convene the meeting, and, on refusal, the nine members are empowered in the same manner as the president, vice-presidents, or directors should have done.

#### THE TREASURER,

In the absence of the president and vice-presidents, shall preside at all meetings of the college, and shall report monthly to the council the state of the college accounts. He is to pay no bills exceeding twenty pounds without a written order signed by three of the council.

#### THE PROFESSOR

Shall have the arrangement and direction of the

studies and occupations of the pupils, of the distribution of his lectures, and of the number and nature of the subjects required for dissection. He shall likewise judge of the kind and quality of the forage provided for the infirmary, and of the regulation of the cattle therein, and of the remedies employed. He shall make a report every week to the committee of the state of the college: viz., the number and condition of the animals admitted into the college; the number and condition of the animals discharged from the college; the conduct of the pupils, the conduct of the servants, the different sorts of forage as well as of stores and materials wanted, including drugs, &c., except such articles as it shall be found necessary to provide between the meetings of the committee, which is to be reported at the next meeting of the committee. He shall have a copy of the several articles ordered from time to time by the committee, and he shall not receive any thing into the college but what is so ordered, (except as above,) nor without a bill of parcels.

#### THE SECRETARY

Shall reside at the college, and be present at all meetings, councils, and committees; he shall take minutes of all such meetings, and shall announce and read all letters, papers, communications, &c., and shall take care of the official books and papers belonging to the college. He shall write the letters directed to be sent on account of the college, by any meeting, council, or committee. He shall keep the accounts of the college which may arise as well from the general business as from the particular departments; this will include the superintending of the receipts, and delivery of what may be brought to or taken from the college, or any of the departments of shoeing, pharmacy, &c. He shall produce a state of his accounts every week to the committee.

#### THE COLLECTOR.

He shall within one calendar month, after notice is given him by the secretary, of the admission of any member, call on him for his subscription; and shall call on all annual members within one month of the date of their admission, for their subscriptions. He shall have receipt books provided, which receipts shall be signed by the treasurer, and countersigned by himself when he delivered them. He shall at no time retain more than £20 in his hands; and as soon as that sum is collected, he shall pay it to the treasurer. He shall produce his books to the committee every week, and make his report of members in arrear every month.

#### THE SCHOOL AND PUPILS.

1. Any person desirous of becoming a pupil on the foundation of the college, must be able to read and to write legibly; preference shall be given to those youths who shall have received the elements of a good education, and more especially to those who have some knowledge of surgery and pharmacy.

2. Candidates qualified according to the preceding article, and not being under the age of fifteen years, nor more than twenty-two, shall

apply to the secretary, to whom they shall deliver a paper, containing their names, age, and place of abode; and the secretary shall refer the same to the next meeting of the council or superintending committee. The limitation of the age is not extended to practitioners in medicine or surgery, or to persons having made some progress in those studies.

3. The pupils on the foundation of the college, shall be appointed by the council; and care shall be taken as much as possible to admit them from different counties, for the purpose of disseminating the science.

4. When a pupil is admitted on the foundation of the college, he shall engage to remain so long in the college as an assistant, as shall be required by the council, not exceeding two years, and shall give security to the college for that purpose; and for his proper conduct during that time; but he shall be at liberty to retire on paying to the college so much as he would have done not being on the foundation.

5. Persons qualified according to rules No. 1 and 2, will be admitted into the college on paying twenty guineas, which will constitute them perpetual pupils.

6. Pupils on the foundation who appear to have a taste for drawing, shall have a master to instruct them. The other pupils may also attend such master upon paying for such instruction.

#### OF THE DISTRIBUTION OF THE STUDIES.

Although the particular distribution of the studies shall be referred to the judgment of the professor, yet the general order of them shall be nearly as follows:—

The knowledge of the animal economy being indispensable to those who would make any progress in the art of healing, the pupils shall be first instructed in zootomy.

##### FIRST COURSE.

The study of zootomy shall begin on the 1st of November, and end on the 30th April of the following year.

##### SECOND COURSE.

The study of the exterior knowledge of the horse shall begin on the 1st of May, and end on the 30th of October. In this course the pupil shall be taught the good and bad conformation of the animal, as also the external diseases which affect his body and limbs.

##### THIRD COURSE.

The course of operations shall begin on the 1st of November, and end the 30th January of the following year. From the 1st of February to the 30th April, the pupils shall put in practice those surgical operations which they shall have been taught in the preceding course of lectures. This shall employ them the mornings only; in the evening they shall be instructed in the *materia medica*.

##### FOURTH COURSE.

The pupils shall attend a course of pharmacy, to obtain a knowledge of the different preparations; they shall divide their mornings between the dispensary and laboratory.

##### FIFTH COURSE.

A knowledge of the common plants and herbs being necessary to the veterinary physician, the pupils shall attend a course of botany relative to veterinary medicine. This course shall take place in the afternoon, and shall as well as the preceding continue during the summer.

##### SIXTH COURSE.

It being necessary that the shoeing of horses shall be perfectly understood, the pupils shall attend the forge in the morning. In the evening lectures shall be given in pathology, to prepare them for the practice of the infirmary.

##### SEVENTH COURSE.

The pupils, after having gone through every branch of the veterinary art, shall be obliged to attend the infirmary every day, when the professor shall employ them according to their respective abilities. He shall confide to their care, one, two, three, or more animals, whose symptoms they shall be obliged accurately to observe, and note down in a journal, and report the same daily to the professor. But the treatment of the patient shall always be directed by the professor, and strictly attended to by the pupil.

##### EIGHTH COURSE.

The design of the institution would fail in a great degree if the pupils were not to be instructed in the nature of epizootic diseases to which animals are liable. The veterinary physician having before him the table of symptoms which characterise diseases, will be enabled to discern the nature of the maladies which he has to encounter, and consequently to make a better choice of remedies proper to remove them. In this course, therefore, the pupils will be taught the method of distinguishing, preventing, and curing diseases as they occur in particular animals. The pupils, having completed their studies, shall undergo a public examination in the theory and practice of every branch of the veterinary art; and those who shall be considered as perfectly instructed therein, shall receive a certificate signed by the professor, and confirmed by the council.

It appears by the above division of the studies that a term of three years is sufficient for a complete education, provided the pupils are capable, assiduous, and well inclined.

#### OF THE INFIRMARY.

An infirmary shall be open for the reception of diseased animals belonging to the members of the college.

No horses or any animals shall, under any pretence whatever, be received into the college, but those actually the property of subscribers; and to prevent imposition by servants, no horse or other animal shall be received, unless accompanied with a cheque signed by the owner. Blank cheques are always to be had on application to the college.

When horses, &c., are taken from the college, the expenses either of keeping or shoeing shall be paid by the groom or other person taking the animal from thence, before it shall be delivered to him.

The price of shoeing shall be 1s. per shoe, and the price of keep for horses taken into the infirmary shall be 2s. per day.

Each subscriber shall have the privilege of sending one horse at a time to the infirmary, and when the stalls are occupied, the horses sent shall be taken in rotation as the stalls become vacant. A book shall be kept in which shall be inserted the applications for the admission of horses.

Eight stalls shall be kept vacant for the purpose of admitting horses in very acute or accidental cases, out of the plan of rotation.

Monday, Wednesday, and Friday, shall be the only days of admission into the infirmary, (except in cases of accident,) and Tuesday, Thursday, and Saturday the only days of delivery from thence.

When the owner of a horse or other animal receives notice of his horse being ready to be discharged from the infirmary, he shall send for him on the day mentioned in the notice; and shall also send by the groom or other person, the amount of the keep, (which will be specified in the notice,) with the notice itself, to prevent any imposition on the college. On neglecting to send for the horse or other animal on receiving such notice, the price of keep will be advanced double from that time; and on continuance of such neglect, the committee shall either send the horse to a livery stable at the expense and risk of the owner, or sell it to pay the charges, as they may think proper; giving the proprietor a week's notice of such determination.

No person whatever, the members of the council excepted, shall be permitted to go into the infirmary without the permission of the professor, nor at any time but between the hours of eleven and two o'clock.

If any animal die in the infirmary, the body shall belong to the college, and the professor shall open it before the pupils for their particular instruction.

#### RULES CONCERNING THE GROOMS AND HELPERS.

No grooms, helpers, &c., shall be retained in the service of the college, but such as are sober and diligent, and approved of by the superintending committee.

As the food shall be ordered every day by the professor, according to the state of the patient, the groom shall not increase or lessen the portions ordered. This article must be observed with the most rigid exactness.

The infirmary shall be kept in the greatest degree of cleanliness.

An assistant shall be appointed, who will be charged with the care of the dispensary and laboratory, under the direction of the professor.

The most gentle treatment of the animals is strictly enjoined. The groom or assistant who shall be convicted of having abused a horse, &c., shall be instantly discharged.

A steward shall be appointed who will be charged with the care of the forage, &c., belonging to the college.

A smith shall be appointed, who will be charged with the care of the forge, subject to the professor, by whom he shall be appointed or dismissed, with the approbation of the committee.

Other servants shall be hereafter appointed as occasion may require.

#### REGULATIONS FOR THE INTERIOR DISCIPLINE OF THE RESIDENT PUPILS.

##### CONCERNING THE HOURS OF RISING, RETIRING TO BED, AND MEALS.

1. The pupils are to rise at six in the morning, from Ladyday to Michaelmas; and at seven, from Michaelmas till Ladyday.

2. The hour of breakfast is eight; of dinner, two; and of supper, in the summer, nine, and, in winter, eight o'clock.

3. Immediately after supper, the pupils are to retire to the common sitting-room till 10 o'clock, at which hour each is to retire to his bedchamber.

4. No pupils will be permitted to burn candle in the night, under pretence of study; the lights are to be extinguished before the pupils go to bed, and none are to remain up after 11 o'clock.

5. The pupils are to take their places at table according to the order of precedence in their several classes.

6. No commons are to be carried into any private room, but in case of sickness, and with leave of the professor.

7. No provisions but the commons are to be dressed in the kitchen for any of the pupils, nor to be introduced into their apartments from any other quarter. Wine and spirits are absolutely prohibited.

##### CONCERNING THE STUDIES.

1. Every pupil is required to attend his studies and the lectures regularly, according to the appointment of the professor.

2. The studies of the morning are to commence at nine o'clock, and conclude at one o'clock; and, in the afternoon, to commence at four o'clock, and conclude at 7; the afternoons of Thursday and Saturday excepted.

3. The professor is to keep a book in which he is to record the attendance or non-attendance of the pupils in their respective classes, which book is to be produced to the committee at their meetings.

4. There will be a vacation, commencing the 15th of August, and ending the 13th of September, except with those pupils who are in the third year of their studies.

##### CONCERNING THE LIBRARY.

1. Every pupil who takes a book out of the library for his private use, is to make an entry of it in the library book, and is to be accountable for it.

2. Every pupil is to return the books to their proper places in the library by four o'clock on Saturday afternoon.

3. No book belonging to the library is to be left in any public room or passage, but must be carefully kept in the possession of the pupil who takes it from the library.

4. No pupil shall take pens, ink, or paper, the library book, or the catalogue of books, out of the library, nor write in any book belonging to the library, except the entry of the books he takes from thence.

##### CONCERNING ABSENCE FROM COLLEGE, AND RETURN, AND OF TIME OF SHUTTING THE GATES.

1. Nothing but illness shall be admitted as an

excuse for any of the pupils absenting themselves from some place of public worship.

2. No pupil will be admitted to go to London, except by desire of a parent, guardian, or persons properly authorised by them, expressed by letter to the professor, unless on some particular emergency, of which the professor shall judge and report to the committee at their next meeting.

3. No pupil is to go beyond the boundaries of the college after the gates are closed in the evening, without permission from the professor; and every pupil who has leave of absence in the day is to return to the college before the gates are locked.

4. The gates are to be locked, from Ladyday to Midsummer, at eight o'clock, and from Michaelmas to Ladyday at seven.

5. Every pupil who leaves or enters the college premises, by any other way than the gates, is guilty of a misdemeanour, and if this offence be committed after the gates are locked, it will be considered as a high aggravation.

6. Every pupil who passes the night out of the college, without leave from the committee, (except as requested in No. 2.) will be expelled, or suffer such other punishment as the circumstances may require.

#### MISCELLANEOUS.

1. There shall be no intercourse between the pupils and the domestic servants; nor shall they go into the kitchen, or those parts of the house where the servants are occupied in their necessary employments.

2. Whoever breaks, or in other respects injures, the utensils or furniture belonging to the college, shall pay for or replace the articles.

3. No visitors shall be admitted but in the intervals of study, and the pupils shall not be allowed to entertain them, or each other, with any thing but tea or coffee.

4. No pupil shall, on any pretence whatever, take from the college, or lend to any person, any copy of the professor's manuscripts, or any notes or memorandums of his lectures.

5. No pupil shall interrupt the studies of the other pupils, by quarrelling or playing, nor will any improper language or conversation be tolerated on any account, either in the hours of study or at any other time; and the only distinction in the college shall arise from regular behaviour and diligent application.

6. Every pupil shall punctually attend to the foregoing regulations, and also to the directions of the professor. Every act of disobedience will incur, on the first offence, the reprimand of the professor; on the second offence, the professor is required to make a report to the committee, who may either impose a fine, or, if they think proper, report the matter to the council at their first meeting, with whom remains the power of expulsion.

Payment of fines is not considered as in any degree an adequate compensation for an habitual breach of any of the laws; and, as the professor is expected to make a regular report to the committee with regard to the observance or violation of them, they will be strictly supported, as well for the reputation and improvement of the pupils as for the general credit and benefit of the institution.

## BONDED CORN.

TO THE EDITOR OF THE PUBLIC LEDGER.

Sir,—Seeing in your paper on Saturday last that you not only notice my petition which Sir Edward Codrington did me the favour to present to the House of Commons on the preceding day, on the subject of grinding bonded corn, but that you gave it at length, and although Sir Edward distinctly stated the object and difference of the present prayer of the petition from that of the last session and former years, in order to meet the anticipated objections alluded to in the speech of the right hon. the president of the board of trade, it was not noticed by him, as a set off, although I had previously proposed to the right hon. gentleman and his Majesty's ministers, that if bonded corn only should be permitted to be ground, the offal consisting of the bran and pollard, should become the property of the Crown, and which provision I considered would be a sure preventive against fraud, and that the whole of the flour, middlings &c., should be immediately transmitted to a bonded warehouse; and again, if my last proposition of using one-fourth of British corn with three-fourths of foreign should be attended to, I proposed that seven bushels of flour and middling out of eight bushels of the mixed wheat should be also immediately sent from the mills (which I propose also to be under lock) to a bonded warehouse, and that the remaining weight of offal, consisting of the bran, pollard, &c., only should be brought into the home market. With such provisions, therefore, by what possible contrivance can fraud be contemplated, or how can any be concocted under such restrictions? There can be no smuggling in either case, or connivance. The first is protected by government receiving the offal gratis, and the latter provides that one bushel weight in flour more than the whole of the foreign wheats used in every quarter should be exported.

As however, the right hon. president intimates that it would be better, in his opinion, to delay the consideration of this question until a more favourable opportunity presented itself, or, in other words, until an alteration of the corn laws is propounded, I take the liberty, as one of independent principles, humbly however, to say, that I differ with him in the main, because in the present depressed state of the agriculturists, I think that question cannot now be brought forward with any chance of successful termination. But as that idea has been thus hinted from the quarter it has, I consider myself now free to state, without arrogating too much, that I was the first proposer of the triple measure, for the consideration of the executive government, without considering party politics, and which I first did by letter to the Chancellor of the Exchequer, then Mr. Peel, March 1827, viz.:—The total repeal of the malt tax, as a direct boon to the agricultural interests, in exchange for, or extension of, a moderate standing duty on the importation of foreign corn for home consumption, with a drawback on grinding it for exportation. I also proposed and urged the same combined measures to Lord Althorp, as Chancellor of the Exchequer, with my reasons thereon, immediately on his lordship's accession to office, Dec. 1 and 30, 1830; also again to Sir Robert Peel, Feb. 2, 1835; and immediately to each Chancellor of Exchequer, whenever any agitation of the corn laws or malt tax was promised, all of which, however, was done privately from whom I have the honour to acknowledge a prompt reply. But as the public have so recently experienced a defeat of the two latter, I do now humbly consider that the prayer of my present petition ought not in justice to be fettered by any entail.

ment on the promised revision of the corn laws (as hinted) in the present state of excitement, but that it should now rest on its own basis and just foundation for the interest of all. And hence I have no doubt the gallant admiral will honour any aerial ship that may appear in the horizon with a grappling broadside, in his usual style of dexterity.

If you consider the subject worthy of your further notice, and that of the public and the interest you represent, I will, in another or succeeding letter, give my reasons at length for the proposed combination of the three measures, and in what manner, with such combination, the deficit of revenue caused by the demise of the malt tax could then have been mainly maintained.

I have the honour to remain,

Sir, your most obedient, humble servant,  
JAMES SURRY,

York House, Battesea, Sept. 3, 1835.

**ALDERBURY UNION.**—On Thursday, Aug. 27, a meeting of the churchwardens, overseers, and many gentlemen interested in the proposed Alderbury Union was held at the Council-house, Salisbury, when Col. A'Court, the Assistant Poor Law Commissioner, explained at some length his views on that important measure, and clearly demonstrated, from a variety of documents, the great advantages which had been experienced in the Unions already formed, both to the rate-payers, by a diminution of expense, arising from superior management, and also to the poor, themselves, by causing more wages to be given to the industrious independent labourer than could be afforded under the old system; and affording the increased comforts of well-regulated asylums to real objects of distress, for whom alone the poor laws were designed to provide. Amongst many other interesting subjects, a report was read of the migration, some time since, of fifty families from one parish into Lancashire—of their increased wages, comforts and advantages, and the mode was pointed out whereby many thousands of sober and industrious families might there obtain employment, and be well paid for their labour.—In the course of his address, Col. A'Court said he took it for granted that in the present day there was no one bold enough to stand up for the old system—a system under which the labourer must be demoralized—must be pauperized; a system under which the really industrious and independent labourer had no chance—which left no inducement to industry, no motive to exertion; but under which our peasantry were brought up from infancy to look for parochial relief, instead of trusting to their own conduct and activity, to make their way through the world. And so low had the rate of wages become, under the operation of this system, that a man with a family absolutely found himself better off when receiving parish relief than when supporting himself by his labour! Col. A'Court said, he had no hesitation in asserting, that had this state of affairs gone on much longer, not only would landlords have been compelled to lower their rents to a ruinous extent, but farmers would have been at length totally incapacitated from paying either rates or rent. In a word, the whole nation would have become a nation of shopkeepers.—The first union formed in Hampshire was at Alton, where, as in every other place, Col. A'Court encountered the strongest opposition, although the whole of Hampshire was now grouped into districts. After three week's trial of the new system at Alton, he sent to know the result of its operation, and was informed that the rates had decreased from fifty to seventy per cent.!! that a saving of two-thirds had been effected!! So far for the rate-payers: and now for the independent labourers. The farmers said if this was to be the effect of the new system, they could have no objection to raise the labourer to the station which he ought to occupy; and the farmers of that district actually came forward voluntarily, and raised the wages to ten shillings per week.

## BRITISH AGRICULTURE.

English farming is remarkable for a peculiar refinement in the distribution of employments, according to various circumstances of soil and climate. The county of Kent is somewhat more congenial to the growth of hops than the neighbouring county of Sussex; the Sussex farmer, therefore, abstains from growing hops, even for his own use; the beer which his family drink is made of hops grown in Kent. There are some districts especially fit for the growth of natural and artificial grasses for fattening cattle; and the farmer of such districts is seldom a cattle breeder, but purchases lean cattle from jobbers, who have purchased them from farmers in districts best suited to the breeding of cattle. Though the inhabitants of Norwich require a great deal of cheese, yet the farmers thereabouts do not attempt to supply that demand. Their land is less suited to dairy farming than the land in Cheshire, from which county comes great part of the cheese consumed in Norwich; while there are towns again in Cheshire which obtain the greater part of their flour from distant spots peculiarly suited to the growth of corn. Examples without end might be cited of this division of agricultural employments, which seems to be carried to a much higher pitch in England than in any other country. In France and the United States, though much greater differences of climate occasion a more marked separation of some agricultural employments,—such as the production of sugar in the southern states for the use of the northern states, and of oil in the south for the use of the north of France,—still a French or American cultivator generally seeks to raise whatever can be raised on his own land, which he either wants himself, or for which there is any demand in his own neighbourhood. The division of agricultural employments in England is all the more remarkable, because in England the differences of soil and climate are not very remarkable.

The advantage which England derives from confining her agriculturists to agricultural pursuits, and, in various parts of the country, to that particular mode of agriculture best suited to each district, becomes manifest in the superior skill of her farmers. The corn growers of Essex, Suffolk, and Norfolk, the hop-growers of Kent and Worcestershire, the sheep farmers of Sussex and Hampshire, the dairy farmers of Gloucestershire and Cheshire, the cattle-breeders and cyder-growers of Devonshire and Herefordshire, the breeders of horses in Lincolnshire and Yorkshire; all these, and many more which it would be tedious to mention, apply to their several pursuits a wonderful degree of knowledge, forethought, and calculation. It is rather a science than an art which each of them pursues; storing up the facts which come to his knowledge, and from a knowledge of those facts, adopting, as a system, that mode of proceeding from which he expects the most beneficial results. Thinking of the pains which an English farmer takes in draining and manuring his fields, in the disposition of his land for various crops, in the selection of seeds, in the use of the best instruments, in keeping up or improving his fruit trees, in the management of his working cattle, in maintaining a peculiar and perfect race of cattle or sheep, and in subdividing the work performed by his united labourers, one might venture to call him a philosopher; though the term would excite ridicule in England, where science is almost as much despised in the abstract as in practice it is industriously cultivated.—*England and America.*

## TO THE RIGHT HON. THE EARL OF STRADBROKE.

MY LORD,—I feel assured that your lordship has an earnest desire to promote the agricultural interest of this county, and will, on that account permit a farmer to suggest to your lordship an improvement upon the Suffolk Wool Fair. Its establishment at present has not conferred much benefit upon the generality of wool growers, because it is impracticable for them to sell their wool by sample, and there is no common place at the fair to deposit the bulk. I therefore beg leave to suggest that a capacious building be procured in an eligible situation in Ipswich, and fitted up in compartments, each holding from 100 to 1,500 fleeces. Farmers and wool-dealers might, in these compartments, (each under lock), deposit their wool previously to the fair, which the following reasons induce me to think might then become a mart, advantageous to buyers and sellers. Ipswich being a port from whence much of this county's wool is sent, there would be no loss of carriage upon most of the wool sent there for sale. Farmers might then compare different qualities and conditions of wool, and obtain more knowledge of that important article than the generality of us at present possess. The buyers by one journey and in one day might look at and have the offer of many parcels, and sellers have the advantage of offering their wool to different purchasers without requesting them to take a journey to look at a single parcel. The growers of 100 fleeces and the large flock masters would have equal chances of a fair price. But they are both under a great disadvantage in offering to sell at a fair (if it can be so called) an article, without exhibiting either sample or bulk, and which they are unable to describe in a manner satisfactory to the buyers. From a wool hall in Ipswich buyers could pack and send off their several parcels with less trouble than from farm houses; and farmers could—with as little trouble as if it were sold—send their wool into such compartments of the buildings as might be adapted to the number of their fleeces; they might there remain until sold, in better preservation than on the generality of dusty granaries. It may be premature to suggest any details for carrying the proposed plan into execution, until it be known how far it meets the approbation of your lordship and the gentlemen who have established the fair. I shall, therefore, only further suggest that the money requisite for carrying the plan into execution be raised in 10% shares, transferable, and bearing interest to be paid by a moderate charge for each compartment, according to its size, where wool might be deposited; and also from whatever else can be made from such parts of the building as might not be wanted for wool. A competent responsible person, capable of packing and weighing wool, should have the care of the premises, and live upon or near the spot, who should hold himself engaged on certain days previous to and after the fair, to take in wool and deliver it from the hall. The chamber of the building might be exclusively devoted to wool compartments. The ground floor when wanted for wool should not be devoted to any thing else; but at other times might be let for a public auction mart, for furniture, or for any other purpose for which it might be adapted.

Thus, after a few years, the shares might become profitable, and those wool-growers who, to establish the fair, might pledge themselves to send their wool there, would be likely to reap the ad-

vantage of their exertions to forward the plan. I apologize for addressing this letter to your lordship, and subscribe myself, with every respect,  
Your lordship's humble servant, A FARMER.

BROMSGROVE. — At a meeting of the Select Vestry of the parish of Bromsgrove, held May 4, 1835, it was resolved:—"That it is the opinion of this vestry that all property held in trust applicable to the relief of the poor of this parish should be made *publicly* known; that the particulars of such trust property be ascertained, with the mode it is *appropriated*, and hung in a conspicuous place in this vestry-room; to be open to the inspection of the inhabitants of this parish." Application was made to obtain the necessary information, but without effect. In consequence of which, a communication has since been made to the Poor Law Commissioners by Mr. W. A. Greening, and the following is their reply:—

Poor Law Commission Office,  
Somerset House, 19th August, 1835.

Sir,—The Poor Law Commissioners for England and Wales have to acknowledge the receipt of your letter of the 13th inst. With regard to the subject of Charities, the Commissioners are aware that they are entrusted with full powers, by the Poor Law Amendment Act, to compel the production of any documents, deeds, or accounts which may appear to them necessary to explain the administration or appropriation of any charitable funds applicable to the relief of the poor, and this power they are prepared to exercise in all cases where, after due inquiry, they are satisfied that there has existed malversation on the part of those who have the management or disposal of such funds or where the production of such accounts may in other respects be deemed necessary. In the case which you have brought under their notice, the proper course to be pursued, in the opinion of the Commissioners, would be for the Select Vestry of Bromsgrove to make a formal application, in writing to the Justices, for the information which is required respecting the appropriation of any such charitable estates applicable to the relief of the poor of your parish, reporting the result for the Board's information.

Signed by order of the Board,  
E. CHADWICK, Secretary.

MAIDSTONE. — NEW POOR LAW. — A meeting convened by Sir Francis Head, took place at the Star Inn, on Thursday se'nnight, to hear the Hon. Commissioner's statement respecting the introduction of the system into this part of the county. It was very numerously attended by farmers residing in the parishes in the neighbourhood of Maidstone. After explaining the mode adopted in East Kent, at considerable length, and the great reduction of rates it had effected, the Assistant Commissioner proceeded to detail the expenses attending the formation of unions of parishes. He states that it certainly was in the power of the board to form unions wherever they thought proper to do so, but he had always consulted the feelings and wishes of the rate-payers themselves, and uniformly found that they were willing to try the system. The officers of the unions were a clerk, whose average salary in East Kent was 42l, two relieving officers at 80l, an auditor at 32l, a medical officer at 160l, making a total of only 394l;—while, in one instance which had come under his notice, the medical expenses alone of the parishes forming the union had amounted to 420l. After communicating a great deal of information on the subject, Sir Francis left it to the meeting to say whether they were desirous that the system should be introduced. At the request of Lord Marsham, who acted as chairman, hands were held up *pro* and *con*, when out of 313 persons only fourteen were opposed to the measure. The meeting then separated.

TO THE EDITOR OF THE NORWICH  
MERCURY.

SIR,—The carriage which I use myself is on four wheels, and may more properly be termed a van than a waggon. For all purposes I consider four preferable to two-wheel carriages. How often are horses injured, and sometimes rendered useless, by the injuries they receive from the carriage bearing or hanging too much, and frequently from falling under a heavy load. In a four-wheeled carriage this is avoided—added to which two horses abreast will draw (if not as much as three) considerably more than when placed at length. I use a pole in my carriage, it being much cheaper and equally serviceable as shafts. But the principal advantages in using light vans instead of waggons will be, first, a great difference in the expence. My van cost me, on springs, 26*l*.; a good waggon cost, as I am informed, about 50*l*. Again, the bottom of my van is somewhat less than three feet from the ground and is from fourteen to twenty inches lower than waggons generally in use. The difference of labour in loading the two is immense; the difference in weight is also very great, and of course requires less labour in the draught of the horses. On mentioning these advantages to two farmers of my acquaintance, they stated as an objection, (the only one mentioned,) the difficulty of unloading in the harvest from the height of the stacks. I suggested that the stacks might be built lower, but that would increase the expence of thatching. I then suggested the erection of a stage, that would require the expence of an extra man.

It did not occur to me, Mr. Editor, to relate an anecdote which will at once remove the difficulty. A friend of mine, a public brewer, some time since, purchased a copper. In conveying it to its destination he had to pass a gate-way too narrow for his purpose. Do you think, Sir, that in order to remove the obstruction, he removed one or both of the posts? No, he raised the earth two feet, and his copper thus topped the posts.

Let these farmers go and do likewise, and thus reap advantages which I have pointed out from having low and light, instead of those high and cumbersome carriages now generally in use. Yours, truly,

A PRACTICAL AGRICULTURIST.

CLYDESDALE ORCHARDS.—The amount of the sales for large fruit this year is.....£4134 18 6  
For small fruit, including the parishes of Hamilton and Bothwell.....1000 0 0

Total for large and small fruit.....5134 18 6  
The large fruit in 1834 brought.....£2779 3 6  
We may add that the prices this year are less than half what they were at the same time last year. The fruit has sold this year from 3*s* to 5*s* per boll, according to quality, and the distance it is from the Glasgow market. In general the Orchardmen are content as something will be had this year for labour, after satisfying the landlord's claims.

MANURE EXEMPTED FROM TOLL.—It is not generally known that an act passed in July last, 5th and 6th Wm. 4th, ch. 18, entitled an "An Act to exempt carts carrying manure from toll," which exempts carts and carriages carrying manure, dung, compost, soil, and ashes for manuring land, (lime excepted) from toll, wherever they may have come from or be going to, unless they are specially charged by some local act.

## FOREIGN CORN.

Mr. Dillwyn, in moving for the following returns in the House of Commons, on the 20th inst., which were ordered,\* stated it to be his principal object to ascertain whether there were any grounds for a prevailing opinion, that foreign wheat in considerable quantities had been smuggled into the markets in this country from the bonded warehouses or elsewhere:—

Wheat and Flour.—Returns ordered, "of the quantities of wheat and flour sold in Mark-lane in each year since 1824;

"Of the quantities of wheat sold in each of the other 149 markets from which returns are made since 1828, and in the other towns which made returns prior to 1828, for each year since 1824;

"Of the quantities of wheat and flour imported into this country from Ireland, as the produce of that kingdom, in each year since 1824;

"Similar returns with regard to Scotland;

"Of the quantities of foreign wheat and flour entered for home consumption, and upon which duty has been paid, for each year of the same period;

"Of the quantities of wheat, flour, and biscuit imported into this country from Jersey, Guernsey, and the Isle of Man, in each year since 1824; distinguishing the ports at which they were entered;

"Of the quantities of wheat, flour, and biscuit exported from the same Islands in each year of the same period; specifying the places to which they were sent;

"Of the quantities of wheat and flour imported into this country from Canada, and entered for home consumption, in each year of the same period;

"Of the quantity of foreign wheat in bond on 1st Oct. 1824;

"Of the quantity of foreign wheat bonded since that date;

"Of the quantity of foreign wheat remaining in bond, at the time of making up the last return;

"Of the quantity of foreign wheat taken out of bond in each year since 1st October, 1824."

HINT TO AGRICULTURISTS.—Incalculable damage has been sustained this season from the ravages of a black caterpillar (provincially called "the Negro") which has appeared in myriads, and carried off most of the white round turnip crops in the western part of Sussex. The daily papers mention that in Devonshire the ravages of this insect have been also equally destructive there. Mr. Amore of Poling, near Arundel, hit upon the following novel and successful plan of ridding his turnip crop of the noxious insect: he drew over the ground a light bush harrow three mornings in succession which completely destroyed the troublesome visitors.—*Sussex Advertiser*.

RURAL FEAT. — Mr. William Mead, of North Petherton, farmer and butcher, cut, on the 19th of August last, six statute acres of barley, between the hours of two in the morning, and ten at night, for a wager of five pounds, which he accomplished easily, to the astonishment of all present. The quantity of barley was a fair average crop.

Two philanthropists of the town of Bar have just made an important discovery, copied into the *Journal de la Meuse*: they have with the greatest success employed the skin of the potatoe in place of tobacco; and further assure us that even competent judges in the art of "pulling a cloud," as well as amateurs who advocate the use of a pipe, have one and all been deceived by it.

\* The order has since been discharged, on the motion of Mr. P. Thompson.

## POOR LAWS IN IRELAND.

TO THE EDITOR OF THE SUSSEX ADVERTISER.

Sir,—Having trespassed so largely upon your paper for several weeks past, I will endeavour in bringing this subject to a conclusion, to be as brief as possible, trusting that while “labouring to be concise, I shall not become obscure.”

It is but little creditable to the vaunted humanity and wisdom of the age, that no effort has yet been made to improve the condition of the miserable peasantry of Ireland. The legislature have wasted session after session in discussing measures of relief for the wealthier classes; but it can scarcely waste one hour to search for means to remedy the misery in which the mass of the people is steeped. Never was the poor of any nation, either Heathen or Christian, left in so destitute, in so pitiable and forlorn a state as those of Ireland. In all other countries, some revenues have been set aside for the relief of the impotent pauper; but in Ireland the dreams of the economist have been realized, and the lame, the halt, the blind, the aged and the orphan poor have been left entirely to the unaided assistance of casual and individual charity. Idleness and vagrancy are the real impediments which stand in the way of the improvement and prosperity of Ireland. As things are now managed an enormous proportion of the whole population actually subsist, in a state of perfect idleness, upon the bounty of the remainder, which is seldom more than half employed. Hence it is that the naturally fertile soil of Ireland is but half tilled; and of the produce, which land imperfectly cultivated must yield, a considerable portion is daily wasted upon athletic and unoccupied vagabonds. The idleness thus fostered is the true cause of the misery of the Irish population:—this pernicious practice preys upon the vitals of the land; like a worm it secretly eats into the germ of her prosperity; and until the thousands and tens of thousands huge-limbed and long-backed vagabonds, now maintained in idleness, be employed productively, Ireland can never emerge from her poverty. All authorities, acquainted with the condition of Ireland, concur in stating that “Itinerant mendicacy has proceeded to an enormous and lamentable extent”;—“The number of people supported by charity in Ireland, is quite inconceivable.” General vagrancy is the unavoidable result of the want of a system to provide a maintenance for the poor: where no poor laws exist, persons unable to work must necessarily be allowed to ask for charity; the affluent are compelled to submit with patience to the inconvenience of being importuned and beset in the streets, on the roads, and at their houses. It must also be obvious that wherever the support of the indigent is left to private charity, the burden must fall unequally upon the members of the community possessing means to contribute. The benevolent, the feeling, and the religious are induced to bestow their property and their time, and even endanger their health in efforts to alleviate the afflictions of their fellow-creatures, but the proud and hard-hearted make no such sacrifices: they continue in the selfish enjoyment of their riches and their property remains undiminished by the calls of benevolence and by the tears of the wretched. An equal rate for the relief of the poor is therefore the only means of reaching the pockets of this class, and compelling them to bear their fair proportion of the burden of maintaining the poor.

In a former letter I stated that when this question is brought before the House of Parliament, it must be dealt with without consulting Irish Absentee Landlords on its propriety or impropriety, and I

think that the speech made by the Earl of Limerick, the other night, in the House of Lords, on the presentation of a petition by the Duke of Richmond, praying for the introduction of poor laws into Ireland, fully bears out my assertion. It was a speech most unjust, unfeeling, and illiberal, bounded by narrow views and petty prejudices, and wholly characteristic of the opinions entertained by the great body of these Irish land-proprietors. Let the people of England and Scotland look well to this. Could the wishes of these liberal absentees be realized the farmer might maintain the Irish poor; and unless some measures are speedily adopted to prevent such flagrant injustice, such will be the case. Two thousand of these Irish vagrants were landed at Liverpool during the last week from one steam-boat, and nearly every packet brings a fresh supply; surely these facts require no comment.

I now bring this subject to a conclusion. I am fully aware that I have not been able, through lack of ability, to do anything like justice to it, but I trust I have said quite enough to shew the absolute necessity which exists of governing Ireland with poor laws. I beg to thank you for your courtesy in inserting my former letters in your paper, and I trust that this will also have a place in it.

I am, Sir,

Your Obedient Servant,  
JUSTITIA.

Lewes.

## CIDER.

Cider, which is the fermented juice of apples, is conjectured to have been originally known in Africa, it being noticed by the two African fathers, Tertullian and Augustine, and it was introduced by the Carthaginians into Biscay; where as well as in other countries uncongenial to the culture of the vine, it has been usefully adopted. It appears that the Normans obtained it from Biscay, and if *cicera* means cider, the mention of it occurs in Hengist's feast in Nennius, which is not improbable, because cyder is Anglo-Saxon. It is not known from whence we first received the cultivated apple, though in its wild state it is probably indigenous. In the time of Pliny upwards of twenty varieties were known, and Parkinson, in 1629, enumerates fifty-seven kinds: Gibson says, that Lord Scudamore, ambassador to the court of France in the reign of Charles I., obtained scions of cider-apple trees in Normandy, and encouraged the grafting of them in Herefordshire, which has since been so celebrated for its cider. Hartlib, in 1650, believes that there were 500 sorts in this country.

The fruit-catalogue of the London Horticultural Society of 1831 contains the names of 1400 varieties of apple, and it does not include many of the names known in the west of England, though perhaps some of them may be synonymous. Apple-trees were anciently sprinkled with a libation of cider and toast on Christmas day or Twelfth Eve, and this, which was probably a remain of the sacrifice to Pomona, was considered conducive to the production of an abundant crop, and on St. James's day (July 25,) the apples were blessed by the priest. The apples used for cider in the West of England are, among others, the Longney Russet—the Exel—the Duke—the Ansell—the Styre—the Redstreak—the Golden Harvey—the Devonshire Wilding, &c., &c., of which the Styre and some others are becoming extinct; but their loss is supplied by new apples of equal excellence. Generally speaking, those apples that are considerably astringent, and are unfit for the table or culinary

purposes, make the best cider; while the Ashmead Pippin, which is sweet, and perhaps one of the best table-apples that we have, is not at all adapted for cider. Different apples are sometimes advantageously used together for the production of cider, and almost every cider-maker has some favorite sort, and some peculiarity in the manufacture. Mr. Knight has ascertained that the specific gravity of the juice of an apple recently expressed denotes with very considerable certainty the strength of the future cider; and according to Mr. Brande's table, the highest average of spirit or alcohol per cent. in cider is 9.87.

The process of cider-making in the West of England is to have the apple-trees gently shaken at two or three different times, that only the ripest fruit may fall; the apples are then laid in heaps, which if circumstances permit, should be under cover, with a free admission of air. They are suffered to remain ten days or a fortnight, and some kinds even longer; and the good cider-maker takes care that the decayed apples and other impurities may be removed before they are taken to the cider-mill, where they are crushed by a large circular stone which is turned by a horse. When the apples are completely mashed, the must, as the crushed apples are then called, is placed in large square pieces of hair-cloth, each hair-cloth being folded over so that nothing but the juice can escape when they are put under the screw-press to which they are removed, and where they remain till the juice is all expressed. The juice is received into a large tub, from which it is conveyed to the casks. Those who do not rack their cider (about which there is a difference of opinion) cover the bung-hole of the cask with a tile, and let it stay till March or April, when to every cask of 100 gallons is put half a pound of hops, and a little colouring made of burnt sugar, and the cider is then stopped close, and is fit for drinking at the end of the year. It is doubtful whether the hops improve the cider, but they probably make it keep better: this method makes the strong cider, which is the principal beverage used in the cider countries: that consumed in London being prepared and sweetened by persons who purchase the cider from the maker.

In Devonshire the cider is racked (which is, drawing the clear cider from the dregs, and putting it into clean casks) as often as the fermentation comes on, a brimstone-match being burnt in each cask before the cider is put into it: this management preserves the sweetness but in an equal proportion diminishes the strength. Seven or eight sacks of apples will afford a hundred gallons of cider, the expense of making which does not exceed 10s. A cider-mill has been lately constructed in Gloucestershire, which is much superior to the old mill, it is driven by water, and makes from 300 to 400 gallons a-day. In this mill the apples are placed in a large box, with an aperture in the bottom, which drops the apples between two iron rollers; these break them in pieces, after which they fall between two stone rollers set so close to each other as to crush the kernels of the apples, which is essential to the flavour of the cider. The must is in this mill received into a large tub beneath the rollers, and from thence put into the press.

## A HINT TO AGRICULTURISTS.

TO THE EDITOR OF THE HEREFORD JOURNAL.

Sir,—your two anonymous correspondents on the delinquency of our county member, puts me in mind of the pot-and-kettle story; I am glad, however, to find that Sir Robert has an advocate

among us, in hopes that he will have the kindness to enumerate the good deeds that gentleman has rendered to his constituents, as I fear that if brother farmers have no better representative, they must shortly go to the wall; I may be mistaken, and shall be very glad to find things better than expectation; but again to oppose our best friend Chandos, is really to bad! and much at variance with professions again and again repeated a few months ago. The Marquis, however, having declared perpetual war on the subject, the cause being so good, the minorities in our favour being so respectable, and the defences being so delapidated, that with half a legitimate share of support, he must succeed. (Put a spoke in the wheel Brother Farmers.)

As to the mode of attack in the house of late against the free-traders, I cannot say that I have been at all sanguine of success; it has been only by feelers, blank shells, to measure distances, &c, and these have so far succeeded as to expose the weakness as well as the foolhardihood of the defence. We are, it seems, gladly to embrace "practicable relief, from local taxation," as the "surplus revenue" is so very small. Truly, my friends, these are weighty considerations; about sixty millions a year is but a mere trifle to be raised when wheat is at 4s 10d a bushel! This excuse is now become very stale—we have been amused with it many years.

What then is to be done for "the foundation," the "source of all our greatness?" I would change the mode of attack. I have long proposed to increase the revenue and this "small surplus;" fix a permanent import duty of forty shillings a quarter on all foreign wheat imported. This is the old mode, the tried mode, the mode which has right-well succeeded; the mode under which our debts were chiefly contracted; the mode under which all parties have been well-doing, and paid astonishing sums with cheerfulness; and which, under still worse circumstances of greatly increased debts, must be again adopted.

I again publicly challenge Sir Robert, the farmer of 800 acres, Sir Robert the Spinner and manufacturer, (whose family are said to have thereby accumulated millions,)—and all the fraternity of free-traders, Whigs, and Tories, to point out a family or industrious individual, who would have just cause of complaint from the price of English wheat being ten shillings a bushel, or twopence a-day per individual; and if one mode of relief to the English farmer in the opinion of our wise men will not do, they who reject proposed methods, ought to prescribe some other which will do.

Every quarter of corn we import is hiring and paying foreign labour, while our own men are starving for want of employ.

Every labourer we banish as an emigrant, is improving foreign soils, while our own thirty millions of waste acres are sterile for want of labour only. Let them only tell us the value of any country without labour or inhabitant.

The hubbub of foreign trade is nothing new. The bubble has been often inflated, and as frequently burst, as it must and will do again, when our legislators come to their senses and can dismiss party and selfish motives, so far as to profit by the experience which they may find in history, and in the ruined condition of the soil and cultivators to be seen around them, in the country's best friends, "the foundation and source of all its greatness".

Something must be done, and they cannot mend

the old plan; all other expedients are weak and futile, mere fleabites, robbing Peter to pay Paul. It is a mere whim of the moment to suppose that the march of intellect and the march of machinery too is active here only, and asleep in other countries.

What if "local taxation" was removed, or agriculture relieved to the amount of a few millions (a few hundreds much more likely,) where will they fall? Every hundred increased to a thousand, must be paid by the lands of John Bull at last. The land must, and does pay all.

The lowering of rents too, is now a rather unpopular proposition, and if the landlords were thus mulct of a few millions (less than half, would be of no use, and that but a short time,) twenty millions would be given to foreigners, and they we may expect, would pay our taxes, but we should experience no such thing! Who would then benefit by this robbery?—not free-traders by any means.

A few sums may, and ought to be screwed out by economy, if our legislators were economists in earnest. A trifle of local taxation may be removed from one shoulder to the other, but what is that to do? a mere drop in the bucket, where hogsheds are wanting, and the absurdity of such chicanery is exposed by a knowledge of its simple amount, and the consideration of the fact, that every shilling per bushel advance in the price of bread-corn (although not perceivable by the consumer) is adding six millions sterling, to the "foundation and support of our own country." Sir Robert of late, is become the plumed advocate of public credit; will anybody believe that he and the sneering Chancellor are among the public creditors below 50*l*. a year? or will any body give them credit for real patriotism, in calling so loudly (not only for two pounds of flesh for one, which they at present obtain) but for the blood also of the deluded agriculturist!

Will they give us a fair statement of the sufferers in each case, the thousands of agriculturists with their dependants, to the scores of public creditors and foreign traders, who are rioting in luxury, and laughing in their sleeves at the nimble thousands they accumulate, while their supporters (and would-be customers) are wasting their property to starvation?

Whoever (brother farmers), either Whig or Tory are the advocates of such measures, they are no real friends to yourselves or the country, and by no means should have your support.

And whoever traduces and vilifies our established church, or encourages those who do (being not men of bible principles) are by no means worthy of public confidence.

The thirty-nine articles, liturgy and discipline of our protestant religion, are wholly founded upon the commands of our Maker, strictly conformable to scripture, and are part and parcel of the laws of the land, as you may find in the writings of many antient divines, and particularly in the commentary and practicable observations of the late Rev. Thomas Scott, who began with prejudice and ended in conviction, after 33 years study of the subject in his bible, are answered very moderately, every doubt and every cavil which has or can arise.

Innovators, therefore, who are continually contriving new plans and schemes, have as much and no more right to set up new doctrines than had Cain, the Sodomites, the Company of Koræ, the worshippers of Baal, or any other idolatrous sect, antient or modern. I remain, Sir, yours, &c.

J. B. TURNER.

## PLUMS.

The plum tree is a native, or naturalized in Britain, being frequently found in hedges; but, its original country is supposed to be Asia; and, according to Pliny, it was brought from Syria into Greece, and thence into Italy. The natural colour of the fruit is generally considered to be black; but the varieties in cultivation are of yellow, red, blue, and green, and of different forms and flavours. Tusser enumerates ten varieties of plums; Parkinson, 60; Miller, only 30 sorts. In the Luxembourg garden catalogue are 68. Professor Lindley enumerates no less than 150 varieties, a few of which it may be seasonably interesting to notice.

First, among the Black or Blue-fruited, is the Blue Gage, a small, round plum, about  $3\frac{1}{2}$  inches in circumference. It has a pale, blue bloom, and its juice is smart; but has little richness of flavour. The Blue Perdrigon has been a long time in our gardens. Hakluyt, in 1822, says, "Of late time, the plum, called the *Perdigevena*, was produced out of Italy, with two kinds more, by the Lord Cromwell after his travel." Kirke's Plum is a very handsome variety, and an excellent bearer; both as a standard, and upon a west wall. It was brought into notice a few years since, by Mr. Kirke, of Brompton, who found it by accident in a fruiterer's window. In the *Pomological Magazine*, it is stated to be "as hardy and prolific as the Orleans, as handsome as the Damask, and as handsome as the Green Gage." The Morocco is one of the very best of our early plums: it is very hardy, bears well as a standard, and ripens fully a month before the Orleans, coming in at the beginning of August. Of Damsons there are several sorts with black fruit, cultivated in England, such as the Common Black, with smooth, spiny branches; Prune Damson, of the smallest size among plums; Royal Damson, somewhat larger; and the Shropshire Damson, with smooth branches, but not spiny. Damsons raised from suckers, and planted in hedge-rows, and grown among nut-bushes, or crowded among and under other trees, can never be expected to produce such fine, thick-fleshed, high-flavoured fruit, as those which are grown upon sound, healthy standards, in proper situations, unincumbered with coarse, strong-growing trees. The Violet is an old plum, and was cultivated by John Tradescant, gardener to Charles I.: it is an excellent bearer, and Mr. Lindley thinks it ought to be planted in the garden of every poor cottager throughout the kingdom: it might then not unaptly be called the Cottager's Plum.

Foremost in the Green-fruited varieties is the Green Gage, without exception the best plum in England. When grown upon a healthy standard, and fully exposed to the sun, although not so large, it is much richer than when produced against a wall. The fruit is thus minutely described by Lindley:—"skin yellowish green, but when fully exposed to the sun of a purplish colour, marbled with russety, muddy red. Flesh yellowish green, very melting, juice abundant, saccharine, of the richest and most exquisite flavour." Sir Joseph Banks notes in the *Horticultural Transactions*, that a plant of this sort was sent from France by the Earl of Stair to the second Duke of Rutland, by the name of Green Spanish. The name of Green Gage is said to have originated from the following accident: the Gage family, in the last century, procured from the monks of the Chartreuse, at Paris, a collection of fruit-trees.

When they arrive in England, the ticket of the Reine Claude had been rubbed off in the passage. The gardener being, from this circumstance, ignorant of the name, called it, when it bore fruit, Green Gage. Lucombe's Nonesuch is a valuable variety, lately raised from seed by Messrs. Lucombe and Co., of Exeter: in the *Pomological Magazine*, it is described as "undoubtedly the nearest approach that has yet been made on the part of a seedling to the famous Green Gage of the English, Reine Claude of the French; and, although it cannot be said to equal, in all respects, that celebrated variety, it is, nevertheless, entitled to a character of very high excellence."

Of the Red or Purple-fruited is the Cherry Plum, somewhat like the Biggareau Cherry, except having a small, slender prickle at its summit. It is planted chiefly in shrubberies, and in the pleasure-ground, for its early flowering. The fruit, however, is very handsome in the dessert, and also makes very excellent tarts. The Fotheringham is a very useful and hardy plum, and has been in England many years, having been cultivated by Sir William Temple,\* at Sheen, near Richmond, before the year 1700; whence it was called the Sheen Plum. The German Prune, or Questrche Plum, is grown for the purpose of drying, and sold in the shops in this country under the name of Prunes. It is cultivated and well known throughout Germany, Thuringia, Saxony, Silesia, Moravia, Bohemia, and Hungary. On the Continent, prunes are stewed and served as a dessert-dish; but, in this country, they are mostly used in medicine: they are emollient and laxative, and are often taken by themselves as a gentle aperient, when there is a tendency to inflammation: the pulp is likewise employed in electuaries, and is an agreeable vehicle for senna. Prunes are chiefly prepared in France from the variety of plum called the St. Catherine; and, in Portugal, from a sort which derives its name from the village of Guimaraens, where they are principally dried. They contain so large a quantity of sugar, that brandy is distilled from them when fermented; and it has even been proposed to manufacture sugar from them.

The Goliath, as its name implies, is a very fine, handsome plum, with juice similar to that of the Orleans. The Imperatrice is an oblong plum, with a rich, deep, purple skin, covered with a thick bloom, which is more copious than on any other plum in Covent-Garden-Market; the flesh is somewhat rich, but exceedingly sweet and rich: it ripens in October, but may be kept till the middle of December. The Imperial Diadem is a very handsome plum, and was raised from seed near Manchester, a few years previous to 1819; it is very juicy, sugary, and highly perfumed when ripe. La Delicieuse was brought to this country from New Jersey, about ten years ago, and first

sold by Mr. Kirke, at a guinea per plant, in 1825: it is very rich and abundant. The Nectarine Plum is very like a nectarine in shape and size: it is much finer and richer than the Goliath, and decidedly the best plum yet known of its size. The Orleans is one of our most common plums, and known in every market through England: the date of its introduction here is uncertain; but it does not appear to have been known to Ray, who died in 1705. The Purple Gage, or Reine Claude Violette, is of very high quality, equal to the Green Gage in flavour, and having this superiority, that while the latter is apt to crack in wet summers, and will never keep after having been gathered, this, on the contrary, will endure, if kept in a dry room, through August and September, even till October. The Red Magnum Bonum is an old plum of our gardens, having been cultivated by John Tradescant. Cobbett says, in his usual knock-down phraseology, "the Magnum Bonums are fit for nothing but tarts and sweetmeats. Magnum is right enough; but as to Bonum, the word has seldom been so completely misapplied." The Violet Diaper is a fleshy, firm plum, very good in the dessert, and excellent when dried as a prune. The Wheat Plum is ripe about the time of the wheat harvest, and is also called the Harvest Plum; it is amber and bright red, and sugary and subacid. The Winesour is said to have originated in the neighbourhood of Rotherham, in Yorkshire, many years ago; "it is," says Lindley, "the most valuable of all our plums for preserving, and great quantities preserved are sent annually from Wakefield and Leeds to distant parts of England. As a preserve, they will keep one or two years, and are preferable to those imported from abroad."

Among the White or Yellow-fruited varieties are the Apricot Plum, considered by some, nearly equal to the Green Gage. The Brignole is named from Brignole, a town of France, famous for its prunes, of which this ranks amongst its best sorts: its colour is pale yellow, for all prunes are not blackish purple, as are those commonly distinguished as prunes. Coe's Plum will hang some time upon the tree after it is matured, and may be kept a long time after it is gathered, either by suspending it by the stalk upon a string, within a window facing the sun, or by wrapping it in soft paper, and keeping it in a dry room. By this latter method, it has been eaten exceedingly good in October, twelve months after it had been gathered. It was raised about thirty years since, by Jervaise Coe, a market-gardener, at Bury St. Edmunds, Suffolk: he told Mr. Lindley it was from the stone of a Green Gage, the blossom of which, he supposed, had been fertilized by the White Magnum Bonum, the two trees of which grew nearly in contact with each other in his garden. The Drap d'Or Plum is the colour of cloth of gold, a bright yellow. The June Hative is the first plum that ripens,—on a south wall, in the middle of July: its flesh is yellow and melting, and its juice sweet; and it is as old as the time of Tradescant. The Washington Plum is a modern variety, of which it is related that the parent tree was purchased at New York, towards the end of the last century. It remained barren several years, till, during a violent thunderstorm, the whole trunk was struck to the earth and destroyed. The root afterwards threw up a number of vigorous shoots, all of which were allowed to remain, and finally produced fruit. It is, therefore, to be presumed, that the stock of the barren kind was the parent of this, trees of which were sent to Robert Barclay, Esq., of Bury Hill, in 1819. The Wentworth

\* The Moorpark Apricot, now so universally known throughout England, is said to have been brought into this country by Sir William Temple, and planted in his garden at Moorpark: if so, it must have been an inhabitant there more than 100 years, as Sir William died in 1700, at the age of 72. In 1830, an old workman was employed in the gardens at Moorpark, who remembered quite well what had always been considered as the original tree, and he used to point out the place where it stood; but this tree has been dead some years, and its place is now occupied by an Orange Apricot, which appears to have been planted ten or twelve years ago.—*Lindley's Guide to the Orchard and Kitchen Garden*, 1831.

is an old plum, and is said to have been named from its having been first planted in the gardens of Thomas Wentworth, Earl of Strafford, at Twickenham: it resembles the Magnum Bonum, and, like that, is excellent for preserving. The White Bullace mostly abounds in Norfolk, and large quantities are brought into the market at Norwich; they are highly esteemed for tarts, and are by some preserved by boiling them in sugar, in which state they will keep twelve months.

Such are a few cultivated varieties of plums, with the names of which some interesting circumstances are connected. Among the neglected varieties, we should not forget the Sloe, which Mr. Knight and others consider as the parent of the bullace, and all the varieties of the common plum. When ripe, it forms an excellent preserve; unripe, the inspissated juice forms an almost indelible ink, used to mark linen. It is used in home-made wines, to communicate the colour and roughness of port; and sloe-juice is almost synonymous with low-priced port-wine. Its leaves have been employed as a substitute for tea, and are well known to afford one of the means used in Europe for adulterating the black tea of China. As a shrubby plant, the sloe is most ornamental, blossoming before all others of the Prunus tribe:—who does not remember “the white-blossomed sloe” of English song. Moreover, its very bark is useful, it being said to possess properties akin to those of Jesuit's Bark.

The wood of the plum is used in turnery, cabinet-work, and in making musical instruments. Its well-known gum is analogous to tragacanth, or gum-dragon: it does not readily dissolve in cold water; but, in other respects, its properties resemble those of gum-arabic.

## BRISTOL AGRICULTURAL SOCIETY.

The third show of this society took place at the Cattle Market on Monday, August, 31st, being the day preceding our autumnal fair. There were about 150 prime beasts exhibited, which called forth the approbation of all present. The pens of sheep and pigs were also good. After inspecting the show the members assembled in the large room of the Inn, when J. S. Harford, Esq., being appointed chairman, the business of the day was opened by that gentleman requesting the secretary to read the report of the committee, which was accordingly done by Mr. Marmont.

After stating that several new members were added to the society, the report alluded to the exhibition of sheep shearing, and announced that the work was performed in a masterly manner; it then proceeded to offer the following suggestion relative to the shows:—

“Your committee feeling anxious that nothing may be left undone to increase the prosperity of the society, and to give the best possible chance to competitors in every description of stock, respectfully beg to recommend that the society should hold only one exhibition in each year, at which premiums of higher value may be offered, and that the time of holding such meeting should be at a period when the animals to be shown shall have arrived very near maturity, and the farmers have a chance of showing them to advantage at other meetings.”

This recommendation, after some discussion respecting the time for holding such meeting, was adopted; and the Friday after the Bath annual

show was fixed as the best. A report of the special committee to inquire into Mr. Smith's claim for the society's premium for draining land was read and adopted, and 10/ voted to Mr. Smith accordingly. Mr. S. was then called upon to explain his mode of draining, and several questions were put to him by the members. The mode is to be communicated to the secretary, and a section of the drains to be laid before the society at the next meeting.

A communication from Mr. John Hobbs, of Stapleton, recommending a specific for the destruction of the fly in turnips, was read, and a vote of thanks passed to Mr. H.

It was resolved to offer a premium for the best method of curing the disease of scouring in cattle.

It was announced that Mr. D. Peters intends offering a premium of 5/ for wool; Messrs. Barber and Edwards 5/ for flax, to which Mr. John Hare's annual donation of 5/ is (by his request) to be added; Mr. Emery, of Banwell, 2 guineas for the best cultivated allotment by a poor person. The thanks of the society were severally voted to those gentlemen.

The judges of live stock (Messrs. Evan David and — (York) then declared the following—

## PREMIUMS AND BOUNTIES.

*Adjudged at the Cattle Show, August 31st, 1835.*

| LIVE STOCK.                                                                                                     |  | £. |
|-----------------------------------------------------------------------------------------------------------------|--|----|
| Mr. Wm. Gibbons, for the best bull, cow, and offspring, the premium of.....                                     |  | 13 |
| Mr. R. Jolliffe, for the best fat ox, the premium of .....                                                      |  | 5  |
| Ditto for a grey steer, a bounty of .....                                                                       |  | 1  |
| Ditto for three steers, a bounty of .....                                                                       |  | 2  |
| Mr. Thos. Smith, for the best fat steer, the premium of .....                                                   |  | 5  |
| Ditto for the best fat heifer, the premium of .....                                                             |  | 4  |
| Ditto for three heifers, a bounty of .....                                                                      |  | 2  |
| Mr. G. Limerick, for the best fat cow, the premium of .....                                                     |  | 4  |
| Ditto for a Durham bull, a bounty of .....                                                                      |  | 1  |
| Ditto for a heifer, a bounty of .....                                                                           |  | 1  |

#### PREMIUMS FOR INDUSTRY AND GOOD BEHAVIOUR.

|                                                                                                          |   |
|----------------------------------------------------------------------------------------------------------|---|
| Wm. Flue, for 49 years' servitude with Sir John Smyth, Bart. and family .....                            | 4 |
| John Goding, for 26 years' servitude with George Emery, Esq. ....                                        | 3 |
| Thomas Felford, for 21 years' servitude with Mr. J. D. Pountney and 10 years' with his predecessor ..... | 2 |
| Geo. Parker, Whitechurch, for bringing up 8 children without parish relief .....                         | 3 |
| John Pike, of Leigh, for bringing up 6 children without parish relief .....                              | 3 |
| Mary Parmiter, for 50 years' servitude with Mr. Edward Smith and family .....                            | 4 |
| Ann Barratt, for 26 years' servitude with Sir John Smyth, Bart. and family .....                         | 3 |
| Elizabeth Hasell, for 23 years' servitude with P. Bower, Esq., and family .....                          | 2 |

After the business of the day was concluded, upwards of fifty gentlemen, members and friends of the society, assembled at the Montague Tavern, and sat down to an excellent dinner, provided by Mr. Marshall, to which Sir John Smyth had kindly contributed a very prime buck. J. S. Harford, Esq. presided at the head of the table, and was ably supported by E. Sampson, Esq. of Henbury, as Vice-President.—The evening passed off much to the satisfaction of all present.

#### NEW POOR LAWS.

The following humane and practical remarks on the evils of the old Poor Law, and the best mode of educating the good derivable from the new, are extracted from a pamphlet on this important subject written by Sir Culling Eardley Smith, Bart. :—

“The allowance system may be said to be confined to certain districts of the kingdom, but there is scarcely a parish in England where the labourer does not consider himself entitled (either in the first instance, or as a last resource) to wages of labour out of the parish funds, for work more or less profitable, as the case may be, to the employers. A principal object of the new poor law is ultimately to make the labour market entirely free, leaving it to every employer to make use of the workman who best answers his purpose, and to every workman to seek for occupation where his diligence and industry will be best rewarded. It was intended to free the occupiers of land from the necessity which has compelled them to employ on their farms, under the penalty of employing them still less profitably out of the rates, labourers whom they do not require, or who do not give them satisfaction; it was intended to free the honest labourer from that mysterious bondage which obliges him to work for an unwilling master, although many persons in other parts of the country would readily employ him at good wages, supposing that they themselves were not compelled to give the preference to the idle and the useless of their own parish. The question is, how much of this undoubtedly beneficial result do the commissioners contemplate effecting during the present year? I do not ask this from mere curiosity: it is important that their intention should be known, because it would

enable the friends of the labouring class to prepare them for the change, by pointing out to them the necessity of exerting themselves to earn an independent livelihood, and the best means of doing so. For instance, if it is intended that the rule shall be that no parish work shall be given during the winter of 1835-6, and that the exception shall be its temporary continuance in certain densely populated parts of the country; then I trust that the commissioners will enable the friends of the labourer to tell him so before his summer earnings begin, and to direct his attention to the best means of increasing and economising those earnings. Foremost among the resources of which the industrious labourer may be reminded, is the cultivation of small allotments, from a rood of land upwards. I do not hesitate to say, as the result of some experience and of a good deal of impartial inquiry, that a poor man with a garden proportioned to his means of cultivating it, and with a probability of earning wages for only two months of the winter, will be more comfortably provided for than if he were sure of private or public employment during the whole winter, but did not possess the advantage of a good garden. It is only those who have seen the increased comforts, and improved habits, and grateful demeanour of the tenants of the “garden field,”—the fattening pig and its “follower,” the store of meal, the cask of ale, the decent dress, in places where such luxuries were before unknown,—who can appreciate the full value of this excellent charity. If then the labourers have early notice that they must absolutely depend on their own exertions, they will become the more anxious to obtain this accommodation; and most landowners, some from kindness and others from policy, will be willing to meet their wishes.

“If when the labourer shall have lost the resource of parish work, he shall find that, in his own neighbourhood, the lowness of wages is such as to prevent his economising against the winter season, and that there are no facilities for obtaining small gardens, it will be in the power of his friends to inform him of other parts of the country better circumstanced in both these respects. I suggested to the commissioners last October the propriety of distributing information in the more distressed districts, as to the rate of wages elsewhere, and the cheapest and quickest means of transport. I am glad to see by the newspapers, that the commissioners have done more than this, and that they have negotiated with employers in or near Manchester, to receive labourers from poor agricultural districts; the result of which, I have no doubt, will be that these labourers will earn a comfortable livelihood, while their masters will receive a benefit in the reduction of the rate of wages at Manchester.

“If, indeed, the prices for the same description of labour in different parts of the country were to be reduced into a tabular form, I believe the public would be astonished at the inequality. During the autumn of 1834, in some parts of the marshes of Lincolnshire, the rate of wages was from 12s to 15s a week, and this after harvest was over: at the same time, nine shillings a week was the usual rate in parts of Hertfordshire; and I understand seven shillings a week was not unusual in Sussex. Now any spirited labourer in either of these low-rated counties, needed only to walk to London, and the next day he might be transported by steam, for five shillings, to the banks of the Humber, where he would be within reach of the higher-rated country. The inequality is so great between the two counties, that it has been found worth while, very recently, for an occupier of land on a considerable scale, to convey a

little colony of labourers from Hertfordshire, to farms on the Wolds of Lincolnshire. Such migration, however, cannot take place to any great extent without some organized assistance, on the part either of the commissioners, or of individuals desirous of the good of the labouring class; for a stranger making his appearance in a distant country might be looked upon with suspicion, unless he carried with him testimonials of character; and though he might succeed in getting high wages during the summer and autumn, yet in the winter months (so long as the occupiers of land are compelled to employ their own parishioners) he might fail in obtaining employment, even if he were the most desirable workman in the place. But first and foremost, a system of mutual information is needed. The farmer who is paying high wages, does not know that there are abundant labourers who would gladly accept a lower rate; and the labourer who is driven to desperation by an over-stocked labour market and scanty pay (as in Sussex), is not aware that a very trifling effort would make him comfortable and independent.

"To return, then, to my proposal: let it once be known that it is the intention of the commissioners that the able-bodied labourers shall, more or less, and *exceptis exceptendis*, depend on their own resources in the winter of 1835-6; and then it will either be competent to the commissioners themselves to assist in equalizing the distribution of labour over the country, or it will be in the power of unions, parishes, or individuals, to disseminate information with a view to the same result."

### LAND IN PORTUGAL.

The following letter was received a short time since from a British gentleman, who has been in the Portuguese military service for two or three years past, and on whose statements reliance may be placed:—

"I am very glad to see your hand writing again. I feel somewhat delicate as to answering your letter. I enclose you the Decree as to the Sale of Lands, by which you will see that if you buy 1,000*l.* worth of land, you must pay down 2,00*l.* and grant sixteen bills bearing interest, payable every year for sixteen years. I think it a most capital speculation, that is to say, I consider it far better than our own Colonies, and if a man is active and resolve to be satisfied without making a fortune in a year, he can live comfortably and indulge in luxuries which he must not think of at home. If a purchaser picks out a fit property, he must make a fortune. If he choose dry land, he must understand irrigation; if he choose wet soil he will get it for nothing, as no Portuguese understands draining, but always put seed into the ground, adapting the seed to the ground, not making the ground in a fit state to receive the seed. Do you understand me? I myself know what I mean, and so must hope that you do. There will be a decided improvement in the breeds of cattle and sheep. Baron de Sa being so aware of it, that he has lately improved ewes for 15*l.* each, and rams at 35*l.* His property is opposite Santarem. Mr. ——— told Mr. ——— his two last years have been very bad, he having made no profit, only being able to support his family comfortably without any loss. Can the ——— farmers do the same many of these bad years? If a purchaser would settle in a rich wine or grain country, and have beside him a few hundred pounds to speculate with, he may at certain seasons make immense profits, by purchasing from the poor peasantry on the spot their grain and wine, serve him-

self, and become a great favourite in the country, no one being his enemy except the merchant with whom he interferes and whose shop he shuts. You see I am favourable to your scheme, but there is one difficulty to overcome. If you bring your own countrymen, they will either quarrel with the neighbourhood or get dissipated and drunk: but if it could be arranged to have one foreman and one labourer, upon whom you could rely, and who must be bribed by getting a share of the profits, that may do; and let all your other labourers be Portuguese, the thing may go on, and then gradually break them in, but all British never will do. I understand the thing very slightly, but I consider all the seeds here very bad, and if you could show an improvement, I think you would have many followers and supporters, as, although they are a jealous crew, still they are a vain set and flattered by a foreigner preferring Portugal to his own country. As yet none of the English officers have settled in the country, but that, *entre nous*, is no criterion by which to judge, as they are now only beginning to find out that there is no more monthly pay or rations, poor and small though they be. You know I used to complain of want of exertion. As to myself I have by no means made up my mind, as I would rather *fight* than *farm*, and as I think old mother Liberty is stalking abroad, I should prefer backing her if it was only through curiosity to see how far the old lady can walk. The Hopes and Dundasses of Scotland instilled into me such a detestation of aristocracy, tyranny, and oppression, that when the feeling comes across me (which it often does) I forget every thing. I think the chances are that I shall invest some money in Portugal, but at present I have not the slightest intention of settling here; my first great wish is to get home among my family and friends, and do my endeavour to have a better opinion of human nature than I now have. As to the security of this country, there is not the slightest chance of Don Miguel or the priesthood coming back. If the Queen dies, to a certainty there would be a row, and at all events if France becomes a republic, Portugal will follow the example, but faith will be kept with the public purchaser—depend on that. This is just, in my opinion, the time to purchase (if you can lay out your money for two years), as there is an alarm about Spain and ridiculous talk about Miguelists. There are a few robberies and murders, but I think it safer than Ireland, and not worse than New South Wales, the Caffres, nor South America and the Canadas, which have their own troubles, and Portugal is near home. But of course there are difficulties to contend with, but none, in my opinion, insurmountable, and none that I would hesitate to encounter. Of course Church property is always the best, and is decidedly better to buy than rent, as by improvement before sixteen years are over, the land should be able to pay the three last instalments. ——— and ——— have been in Algarve looking at old ——— estate. He gave them a plan and rate of expense and return, leaving a clear balance of 1,754*l.* per annum, which he offered to ——— for an advance of 250*l.* I astonished old ——— by asking him if he was ———'s son that he should be so kind. They are not yet returned from their view, but I have a letter from ———. He says "——'s speculation is a decided failure. ——— says he would not have the land for nothing. It consists of a light sandy soil, without water or any house near it for several miles. The old fool has done the English here a deal of harm by taking land and then deserting it, thinking that we are to do the same. We have explored a variety of properties, of which we have taken notes for perusal."

If they return before the packet sails, I shall give you some of their information. I have now seen —and—who have examined many properties, and are so favourably inclined, that they go down in a short time to take farms. Upon a farm of 80 acres and 50l the outlay, they make 450l, with 230l. for living, being 600l, should leave a profit of 400l. I have told both to write to you scientifically, which they are to do. I shall let this go as it is.

### AMERICAN AGRICULTURE.

Mr. Sheriff reached New York in May 1833, and began exploring the agriculture of this portion of the Union, of which he gives the following account:—

"Grass crops are mown for hay five or six years in succession, without being top-dressed or manured in any way—the aftermath, which is seldom abundant, being depastured. Five pounds of red clover, and half a peck of Timothy seeds (*Phileum pratense*), are sown on an acre; and also occasionally, small quantities of herd-grass and red-top, two kinds of poa. I believe the red clover lives longer than it commonly does in the cultivated fields of Britain, having seen many plants after five successive crops of hay. The grass on being ploughed, is followed in the first year by Indian corn without manure, by potatoes with manure, in the second year, and, if early, they are followed with buck-wheat; barley is taken in the third year, and in the fourth, oats accompanied with grass seeds. Potatoes are grown in drills as in Britain, and sometimes in hills three or four feet distant, formed by the surface being marked into squares by the plough. A whole potatoe, or three cuttings, are placed above the manure, and both covered over with earth by the spade. Disease in the potatoe was said to be unknown. The fruit crop is often injured by spring frosts, and wheat by mildew. Swede turnip is sown in August, and stored before winter. Geese are plucked three times a year—live goose feathers being a general article of commerce.

"Farm labourers or helps, get from ten to twelve dollars a-month, with bed and board, including washing, and a deduction is made for sickness or voluntary absence. A married man is allowed from ninety-five to one hundred and twenty dollars a-year, instead of board; and pays from twenty to twenty-five dollars for house and garden rent. The hours of labour are from sunrise to sundown, without a specified time for meals, to which they are commonly summoned by sound of horn. Hired men do not consider themselves bound for any length of time, and occasionally absent themselves for a day or two without giving notice of their intention. Hired spademen get seventy-five cents, or three-quarters of a dollar per day, without board, all the year round."

In the adjoining state of New Jersey, Mr. S. remarked—

"The crops to consist chiefly of rye and Indian corn, and were uniformly bad. Clovers and Timothy grass are seldom seen. In several instances lime or gypsum had been applied where Indian corn was growing, having been carried to the fields in waggons, and spread thinly over the surface. In one instance farm yard manure was being applied in imperfectly formed drills, which, I suppose, were destined to receive potatoes. Women were seen hoeing Indian corn in the fields, and I could not discover whether they were white or coloured. Many orchards, consisting chiefly of peach trees, the fruit of which is dis-

tilled into brandy, had been lately formed, and seemed the only thriving thing on the face of the earth."

This is not the only instance where Mr. S. observed women at work in the fields—a thing which both Mr. Stuart and Mr. Fergusson state is unknown in America.

"In the neighbourhood of Philadelphia, land of fine quality, and in high condition, may be had from 100 to 120 dollars per acre. Produce of all kinds is high, and the straw of a wheat crop has been sold at thirty dollars per acre. Wheat is often mildewed."

The following passage will illustrate the favoured condition of the labourers in America:—

"Men assisting at farm work in the neighbourhood of Philadelphia, get from ten to twelve dollars, with maintenance, per month, and they are not easily obtained to attend regularly at work. Young men and women of the industrious classes in the country, dress in fashionable clothes of the finest fabrics before marriage, after which, the wife becomes a lady, and generally engages a hired girl or help. Thrashing machines are common, but not good; and when the flail is used, barley and oats cost three cents, rye seven cents, and wheat twelve and a half cents per bushel when found.—that is, food provided for the workmen. From the high price of human labour, compared with the price of food, Indian corn is often trod out by oxen. Cradlers generally mow round the field when the crop admits of doing so; and stop only when the scythe requires to be sharpened. Hay costs in cutting from one, to one and a half dollar per acre. Mr. W—— pointed out a field of ryewhich was a good crop, and which he had a few days before let to be cradled at seventy-five cents per acre, without board or any other etcetera. The cradler not being permitted to sit at table with the family, and disliking to eat in the kitchen, had agreed to board with one of Mr. W——'s labourers for forty-five cents per day, and would be thus fed, viz., breakfast at seven o'clock, on wheat-bread, rye bread, fish, cheese, butter and coffee; luncheon at ten o'clock on cold meat, pickled pork, cheese, butter, pickles, bread, and coffee; dine at twelve, on every thing that is good and substantial; at five is served coffee, with bread, butter, fruit, and fruit pie. Occasionally supper is taken at seven, but this meal is considered superfluous."—*Sheriff's Tour in America.*

A valuable discovery in the management of fruit trees has been made by Mr. Crozier, nurseryman, late of Alnwick, and now of Newcastle. The object is to obtain new wood where it may be wanted, and for this purpose a nick is made above the eye where it is wished to produce new shoots, and after many experiments Mr. Crozier has found the expedient completely successful. In a garden, at the Barras-bridge, is a pear tree which has sixteen shoots produced by the above means this season. It has been applied with equal success, to apple, pear, and plum trees, and to the cherry to a certain extent.

We are given to understand that two eminent wool dealers, who occasionally make large purchases in Breconshire, have entered into an arrangement, by virtue of which, low prices are shaped, and consequently little is sold. If this be a fact, more distant dealers will, no doubt, ere long, find their way into the county. To curtail the fair profits of farmers at this period of beggaring depression in other branches of their industry, would be, indeed "too bad."—*Cambrian.*

# FIRST ANNUAL REPORT OF THE POOR LAW COMMISSIONERS FOR ENGLAND AND WALES.

TO THE RIGHT HONOURABLE LORD JOHN RUSSELL,  
HIS MAJESTY'S PRINCIPAL SECRETARY OF STATE  
FOR THE HOME DEPARTMENT.

Poor Law Commission Office, Somerset  
House, 8th August, 1835.

MY LORD,—We are required by the fifth section of the Poor Law Amendment Act, to submit annually to one of His Majesty's Principal Secretaries of State, a "general Report of our Proceedings," in order that it may be laid before both houses of parliament.

In discharging this duty for the first time, we consider that the extent and novelty of the powers created by the legislature, and confided to us by his Majesty, and the peculiar character and importance of the interests which we have been called upon to superintend, demand from us a full exposition of the measures we have adopted; of the reasons for adopting them; and, as far as they can be ascertained, of the effects they have produced.

On the day on which we were sworn into office, we received notifications that the officers of several extensive parishes in the metropolis had prepared to yield up their offices to new local officers, who, it was conceived, were to be immediately appointed by us for the administration of relief throughout England and Wales.

We were at the same early period informed, that in extensive districts great confusion and uncertainty prevailed, arising from an impression that not only had the administration of relief been subjected to our general superintendence and control, but that the whole of the immediate and direct management had devolved upon us, and that the churchwardens and overseers, and other local officers, were no longer authorized to act in any case, unless under our specific directions. We were also apprized that in other parishes under the control of select vestries or boards of guardians, the danger of sudden interruptions of relief to large numbers of paupers was incurred by the want of preparation, arising chiefly from the absence of precise and authentic information, on the part of most of those bodies, to enable them to comply with the enactments contained in the 54th section of the Poor Law Amendment Act, which provides that, after the passing of the act, all relief in any such place "shall appertain and belong exclusively to such guardians of the poor or select vestry."

In a large proportion of this class of parishes, the select vestries and boards of guardians had been accustomed to meet irregularly, at intervals of a fortnight or a month, or still less frequently, the great bulk of the out-door relief being dispensed weekly, wholly in money, by the overseers. So soon as the provisions of that section of the act became known, the overseers of these parishes found that they were prohibited from granting any relief whatever, except under the express directions of the select vestries or boards of guardians, and except also in cases of urgent necessity, in which they were limited to the administration of relief in kind. The overseers, in the instances to which we advert, were unprepared with arrangements for any extensive substitution of relief in kind for relief in money, and the boards of guardians

and select vestries were unprepared to meet frequently, or to enter upon the extensive charge which suddenly devolved upon them.

Our best information at the time of our first entrance on the duties of our office led us to believe that these states of management prevailed, together or separately, in numerous districts, comprising a large portion of the country. Our first proceedings were directed to dispel these various errors promptly by all the means in our power, by verbal explanations to deputations, and direct communications to as large a portion as possible of the officers of the parishes in and near the metropolis, and in the distant parishes by a circular address, advertised forthwith in all the daily papers.

Our chief object was, in all these communications, to impress upon the parish officers generally, that the legislature had not exonerated them from the performance of their duties; that they were still to continue to administer the existing laws for the relief of the poor of the parish or place for which they acted; and that, subject to the provisions of the Poor Law Amendment Act, the general transaction of parochial business should be continued (with strict attention to economy) in the accustomed course, until we should be enabled to take specific measures thereon.

In reference to the change of the law effected by the 54th section, we directed the immediate attention of the select vestries and of the boards of guardians throughout the country to the expediency of adopting measures either by establishing rotas or otherwise, for securing more frequent and regular attendances for the performance of their altered duties in the ordering and superintending the administration of the necessary relief of the paupers.

With a view to promulgate the most authentic explanations of the law, we forwarded to each parish or place in England and Wales, a copy of the act, with an explanatory analysis of its various provisions in the form of a copious index. We at the same time transmitted with the copy of the act the circular letter above adverted to. In this circular to the parish officers we included a set of queries preparatory to further inquiries, with the view of ascertaining accurately the amount of workhouse room, state of pauperism, and the administration of relief in each parish.

Notwithstanding these communications, which we believe had the effect of preventing much disorder, and of retaining in the performance of their duties a large proportion of the officers charged with the immediate distribution of relief, who were prepared to abandon them, we found that a conception had been extensively propagated amongst the overseers in the rural parishes, which yet remained as constituted by the 43d of Elizabeth, that by the operation of the Poor Law Amendment Act they were entirely released from the control of the magistrates. The consequences of this error were stated to us in complaints and appeals from paupers themselves, and in statements of many of the magistrates, who also entertained the belief that in such parishes their power was at an end. These consequences were represented to be, that those dependent on parochial relief were harshly treated, and subjected to privations unwarranted by the legislature.

At the commencement of the winter, the fall in the price of agricultural produce appeared to press heavily upon the farmer, and render necessary a reduction of the wages of the labourer. In those districts where the vicious system of making up the wages of labour from the poor-rates had been established, and where the farmer commonly acts in the incompatible relations of employer of labour in confined labour markets, and of distributor of relief, any alteration of wages, which would in a natural state of things be determined as a question between purchaser and seller, is commonly contested as between paupers with indefinite claims, and a niggardly administrator of a legal fund for relief, believed to be inexhaustible. The first disturbances brought to our cognizance were represented to us as arising out of the interruption of the accustomed administration of relief; but they appeared, on examination, to have originated mainly in questions as to the amount of wages, arising not from the change of the law, but from the alteration of the prices of corn.

Whatever might have been the opinion which we had entertained as to the policy of the law in continuing the power of the magistrates to regulate wages by determining the rate of allowance, we held ourselves bound to use our best exertions for the enforcement of the existing law, according to the manifest intentions of the legislature. In this instance we felt it our duty to exert ourselves to make it known, by a circular letter, and by other means of communication, that in all parishes in which there are no boards of guardians, no select vestries, nor other similar bodies constituted under any general or local act, inasmuch as the acts of the 3 Will. and Mary, c. 11, and the 9 Geo. 1, c. 7, are not repealed, those Acts still authorize justices of the peace to exercise a control over the overseers in the administration of relief. We endeavoured at the same time to make the conditions under which this control was required to be exercised by the existing statutes more completely known than they appeared to have been at any time since their enactment. We may observe, however, that the evidence presented to us in the course of our first experience seemed to prove, that considerable inconvenience would have been incurred had the control of the magistrates in such parishes been at once abrogated, previously, to the transference of their duties in the superintendence of relief, to the boards of guardians created under the new act.

As a consequence of these proceedings, we were immediately led into a widely extended correspondence, in answer to solicitations from all parts of the country for more detailed explanations of the law, and of its application to the peculiar cases of parishes, and even of individuals. Combined with these applications were others for instructions upon questions of administration. Applications of the nature of those which occasioned the circulars and correspondence adverted to, from magistrates, from parochial officers, from rate-payers, as well as paupers, collectively or individually, have from that period continued to increase. They now form a considerable portion of the business of the department, and of the demands upon our attention. The wants thus indicated, we have endeavoured to satisfy by all the means in our power. Being deeply impressed with the extent and importance of the interests affected by our answers, we have availed ourselves of the assistance of counsel upon legal questions, and have from time to time had recourse to the aid of the law officers of the crown. On questions of administration, we have resorted to the

best available sources of information. This information we have extensively disseminated. The varied circumstances under which cases of the like description have been presented to us, in the information we received from all parts of the country, form an increasing body of illustrative evidence, enabling us to meet these applications, and to act with greater confidence than could under any other circumstances have been warranted. The frequent necessity of such references as those to which we have adverted, we would mention as a cause of occasional delays in our proceedings; in addition to which cause, we may also allude to the fact, that as we had no precedent for our guidance, the department being entirely new, every arrangement was required to be made *de novo*, and on the exigency. Our earlier proceedings have also been frequently impeded by the necessity of settling new forms of procedure, and of making detailed arrangements, which rendered it difficult to act with that promptitude which we deem otherwise practicable and necessary.

On the approach of the late winter, when large bodies of the agricultural labourers were thrown out of employment, the applications for advice as to the course which should be taken, and for assistance in particular parishes, and in districts, became numerous and pressing, and difficult to answer satisfactorily in all cases. We found that however particular were the statements of the evils requiring correction, how trustworthy soever might be the applicants, we seldom could feel assured that some material circumstances were not inadvertently overlooked and omitted in the statements transmitted to us. The existing sources of information, independently of the information obtained by personal inquiries on the spot, we found extremely defective as a foundation for the local application of new measures.

Although the investigations of the late Commissioners of Inquiry were more extensive than any preceding, and were fully adequate to the purposes of legislation, (as all our subsequent experience has proved,) yet those investigations did not extend directly or specifically to more than about 5,000 out of the 15,635 parishes or places separately relieving their own paupers; and we are aware that it was an opinion entertained by that board that, for the purpose of the practical application of the new law, a renewed and more detailed inquiry was requisite. On obtaining the answers to the queries which we have mentioned as having forwarded with our first circular, we found that those answers were extremely defective; and that at the best they would only yield general indications with respect to the actual condition of any parish or district. Even where we could entertain no reasonable doubt of the completeness of the information as to the general condition of a parish, attainable by the old means, we could seldom feel assured of the adequacy of the local agency for carrying into execution any general and complete change of system we might require.

In a large proportion of the cases, moreover, there was obviously no agency existing in the single parishes to execute any elaborate change of system. Under these circumstances, and in those cases where applications were made for instructions for an immediate and entire change, we felt that until we could re-examine the parishes or districts in question by our assistant-commissioners, our instructions to the local officers must of necessity be general and discretionary, and could not be safely extended to numerous details.

The applications for directions, however, were too numerous and urgent to admit of our dealing with them separately or specifically by means of our

assistant-commissioners. This state of things, together with the occurrence of some cases of precipitate and violent change made by some of the overseers on their own responsibility, suggested the expediency of issuing another circular of the date of the 8th of November, setting forth, as general recommendations, some of the chief preparatory measures which it might be necessary to adopt. In the instances of voluntary change made by the parish officers, it was stated that the most severe alterations were too frequently adopted towards the aged and infirm persons, they being the least capable of opposing a powerful resistance. In this communication, as in most others relating to the first alterations of relief, we deemed it necessary to urge caution as regarded this class of paupers, and to endeavour to extend protection to them. With reference to the able-bodied paupers, we endeavoured to enforce the adoption of a more correct principle for their employment, namely, by task-work, at such wages as would render the condition of the independent labourer the most eligible.

Another measure, which we then urged in our recommendations, was a preparative to the final adoption of the system which it was the view of the legislature to carry into complete operation, was the gradual substitution of relief in kind, *i. e.* in bread, and other necessities, for relief in money. We have never failed to urge the adoption of this form of relief, whether in cases in which it was necessary to give relief accompanied by the exaction of a return of labour, or in cases in which it appeared that no parish labour could be enforced.

We have found that in parishes where there are no workhouses, or where there are classes of paupers under circumstances in which it might be inexpedient to proffer the workhouse, relief in kind in some degree operated as a self-acting test of the validity of the claim for relief. Advances in money, it should be always recollected, are advances only of the means of obtaining relief, which means the pauper is under constant temptations to misapply, and in a large proportion of cases is incompetent to apply properly. Relief in kind, if well adapted, may be considered as the relief itself; the object of the *bonâ fide* applicant being, not money, but bread, or the immediate means of sustenance. It has been a frequent source of complaint, that of relief in money only a small portion reached the wives and other members of the family for whose sustenance it was given; and that, in the rural districts, the greater portion was spent in the beer shops, and in the towns was expended in the gin shops. Relief in kind we found less liable to misapplication. If instead of giving to a pauper a weekly allowance in money, an allowance be given in food or other necessities of the same value, he can only obtain a reduced amount of his wonted description of indulgence by the misappropriation of the relief in kind. This misappropriation is necessarily attended with increased trouble, loss, and risks of detection. Under this form of relief, we find that the temptation to fraud is diminished to the extent of the additional trouble incurred in the misappropriation, and the reduction of the amount of beer, spirits, or other objects of desire obtained by it. Another advantage seldom noticed as connected with relief in kind, and which has presented itself to our consideration as a reason for bringing this form of relief as early as possible into general operation, is, that in the present condition of the country, it diminishes the fluctuations of allowances in the way of unintended and unwarranted increases.

Where money allowances had by custom remained unchanged in amount, we found the actual allow-

ances of the paupers to be increasing in proportion to the reduction of the price of agricultural and other produce. These incidents of money payment powerfully affected the rural parishes, which when examined, displayed an increase of pressure greatly beyond any nominal increase of the rates. The reports which we have received from a considerable number of parishes, show that the recommendation of this substitution of relief in kind has been extensively acted upon, and that the effects in every instance that has been presented to us, have been, to a greater or less extent beneficial. The letters from the parish of Hatfield Broad Oak will illustrate the nature of the applications made to us, and the effect produced by the measures recommended.

In some of the London parishes the adoption of this form of relief has occasioned a reduction of the burthen of the out-door pauperism to the extent of nearly one-third. In the rural parishes the change is marked by complaints on the part of the beer-shopkeepers, and in towns by the diminished consumption of gin, immediately following the adoption of this mode of relief.

But in many of the single parishes it was alleged, that there was scarcely the means of substituting, without preponderant inconvenience, even relief in kind for relief in money; the agency for effecting even a slight approximation to a correct system being entirely wanting. There are 6,681 parishes in which the population does not exceed 300; 1,907 parishes in which it does not exceed 100; 737 parishes in which the population does not exceed 50 persons. In such parishes, the difference between the worst management, and the best that could be expected, did not suffice to make up for the expense of an adequate system of management, that is, of engaging persons competent to the task of carrying on a better system. From these and other circumstances, in a large proportion of small parishes which were brought within our cognizance, the voluntary introduction of any extensive changes, having for their object the discontinuance of out-door relief, or relief in aid of wages, was found to be impracticable, or only practicable with an extent of trouble, and an expenditure of labour, which would not be compensated by any adequate probability of permanent benefit.

Under these circumstances we proceeded to direct our chief attention to the general introduction of the workhouse system, with as few delays and preparatory measures as might be consistent with the best interests of those of the labouring classes who are pauperized, and with the circumstances of the districts where the changes might be first introduced.

In reference to an objection which has been urged to the general adoption of the workhouse system, and to its application to the cases of large classes of able-bodied paupers, we would here observe, that it is true that in the evidence collected by the late commissioners of inquiry, as well as in the course of our subsequent investigations, instances have been presented to us of parishes which have been dispauperized apparently by means of out-door employment alone, and without the direct agency of a workhouse: but in reality, the use of the workhouse has in these instances been resorted to, though its employment was not manifested. To cite, in illustration, the well-known example of Cookham; that parish was dispauperized chiefly by offering the able-bodied paupers hard work by the piece, for lower wages than they could get elsewhere. The Rev. Thomas Whately, the gentleman who conducted that change, was asked, "You have spoken of the workhouse system as the only means of producing the desired effect, and yet

you appear to have dispauperized the parish without offering the able-bodied paupers the workhouse?—Yes. Although we got rid of the able-bodied paupers by giving them trenching, and without taking them into the workhouse, yet that was only a temporary expedient; and it would not have been possible to have effected this without having had the workhouse in the rear to fall back upon; nor will it be possible, as I conceive, to continue the beneficial arrangements in the parish without it. The first irruption of paupers were got rid of by specific labour; but the incidental paupers, who were continually coming as the *avant couriers* to a tribe of others, could not have been provided with work, especially in the time of frost or snow; and these were silenced by the offer of the workhouse. When a single pauper came in, we could not provide out-door work: we could not have employed a superintendent to superintend the work of one man, nor could we have got trenching for one man, or for two men. If we had not had the workhouse to retire upon, we should have had an influx of paupers applying for work during the winter, whenever the ground was closed by frost or snow. The workhouse, we have found, is the only means of stopping gaps of this kind; and I am persuaded that it is the only means by which the same results can be effected throughout the country."

Now, although in the choice of means for accomplishing the objects of the Legislature, we did not overlook such examples of the beneficial application of out-door relief, or fail to recommend their imitation under similar circumstances, yet the cases we found to be rare where the parishes were so circumstanced as to render the application of out-door relief available in the manner described in the example, instead of the direct offer of a reception in the workhouse.

The following difficulties incidental to this mode of relief by setting able-bodied paupers to work during the day, and allowing them to return to their own homes during the night, were presented to us in practice.

It was reported to us, in a large proportion of the cases where we recommended the employment of labourers at task-work, that no fitting land could be obtained at a reasonable expense within the bounds of the single parish.

Where land was offered, it was frequently perceived, that in providing for this mode of relief considerable danger of jobbing was incurred. The parish farms which have come within our knowledge have all failed of their objects, and have proved to be sources of malversation.

Next we had to encounter the difficulties in procuring agents, at any expense proportionate to the gain, to superintend the enforcement of labour within the smaller parishes. To these difficulties were added others in the enforcement of the performance of labour upon sound principles; difficulties usually arising from the erroneous notions of the parish officers as to the obtaining of a profit from the labour, and the erroneous notions of the labourers as to the amount of work which they are bound to give, and of the wages they are entitled to receive from the parish. And further, the mode of relief was beset by the difficulties adverted to in the instance we have cited, in providing for the necessary interruptions of out-door labour in winter and during bad weather.

Another practical inconvenience presented to us with relation to such labour of out-door paupers applied independently of any workhouse, is the difficulty of separating and distinguishing the out-door pauper from the independent labourer. The pauper

is not distinguished from other labourers when engaged at out-door work. He associates with the other labourers under circumstances to familiarize them with pauper feelings and habits. Out-door labour without the workhouse has also this great and generally insuperable disadvantage, that it is a form of relief which is peculiarly liable to be made subservient to plans for pauperizing the independent labourer, inasmuch as it is a form of relief presenting in some degree the aspect of his regular employment, to which he can least object when offered or suggested to him by any employer, who intends to obtain from the parish a contribution of rates in lieu of the wages he would otherwise be compelled to give. These and other circumstances often render this mode of relief the most dangerous in its consequences of any which it is our duty to control.

These obstacles to the use of out-door labour as a preparative or as an auxiliary to the workhouse, we found generally precluded the consideration of the expediency of providing the means of such labour as a substitute for the workhouse. Without therefore omitting to sanction or enforce the application of out-door labour in aid of or as preparatory to the use of the workhouse, wherever preponderant obstacles and inconveniences did not occur to prevent it, we have been led to the conclusion, that in the greater proportion of cases the public time and means are best economized by immediate proceedings for the earliest and most direct adoption of the workhouse system.

It was not until the 1st of December that we were enabled to complete the appointment of the nine assistant-commissioners, whom we were authorized to appoint in the first instance on our own authority. The considerations which mainly influenced our choice were the possession of sound practical knowledge and experience of the subject matter of this commission, or the possession of acknowledged talent and general aptitude for the dispatch of public business. Subsequently, as the need of further assistance grew with our labours, the consent of the Lords Commissioners of his Majesty's Treasury has successively been obtained to the appointment of an additional number of assistant commissioners. The whole number of persons at this time acting in that capacity is fifteen.

The principle which we have adopted for the selection of the districts for our proceedings in the formation of unions, has been to commence with those in which vicious modes of administration had become the most deeply rooted, and where the pauperized classes were the most demoralized, and the burthens of the rate-payers were the heaviest. It was, however, soon perceived in practice that the amount of the pecuniary burthen beyond the general average of the amount of rates per head on the population of England and Wales, formed the most correct index of the relative amount of disorder arising in a district from mal-administration.

The deviations which we have allowed ourselves to make from the strict order of the relative pecuniary burthen of the districts proceeded with, have been chiefly occasioned by special applications or by the occurrence of particular exigencies. The selection of the part of Berks first visited was occasioned by a special application for the formation of an union. Our assistant-commissioner first visited West Sussex upon an application of the local authorities, in consequence of a commotion which had arisen, apparently on the approach of the change of system in the administration of relief, but really in consequence of the reduction of the ordinary wages of labour. Our first proceedings which led to the

formation of the Wycombe and other unions in the county of Buckingham, were taken in consequence of a forcible appeal to us for the exercise of our functions from the pauper labourers of the parish of Bledlow. Our early intervention in Wiltshire was occasioned by a demand for assistance, in consequence of acts of incendiarism and threatened disturbances, arising from the continuance of abusive modes of administration near Calne; and by an appeal from Colonel Napier and other gentlemen, for the protection of some aged paupers from cruelties or neglect in the parish of Freshford, now included in the Bradford union. The proceedings which led to the formation of the first union of parishes in the county of Middlesex, (the Hendon union), were occasioned by an appeal from the magistrates of the Hendon division to correct the mismanagement of paupers in the Harrow workhouse, for the abatement of which evils the powers of the magistrates under the old law were deemed inadequate. Our first direct intervention by the appointment of a Board of Guardians, in a metropolitan parish, was called for by a large proportion of the rate-payers, to restore peace and to ensure good management in the parish, which was torn by dissensions. The application of a similar description have been numerous beyond our power of immediate compliance.

In several instances, however, where we have so far complied with them that we have caused an assistant-commissioner to visit the district, it having been found upon examination that although evils of the kind complained of did exist, yet that in amount they were greatly below the evils in action, elsewhere, we directed a suspension of proceedings in favour of the most heavily burthened districts.

Having put our assistant-commissioners in possession of our views, and of the general information contained in the reports of the late Commissioners of Inquiry, and all the local information and statistics which our office could furnish relating to the parishes and districts assigned to them, they proceeded to re-examine every parish; 1st, with relation to the description and pressure of any existing evils in the administration of relief in the parish; 2dly, as to the means existing within the parish of remedying such evils; 3dly, as to the remedies available by means of a union with other parishes, and as to the extent of the union requisite and practicable for the most efficient and economical administration on sound principles. Upon this examination the assistant-commissioner is required to prepare a written report to the board, setting forth the measures which he recommends for adoption, and referring to the evidence on which the recommendation of each measure is founded. Where the formation of a union is recommended, a considerable portion of the data collected is reduced to a tabular form. In many instances we find it necessary to hold a personal conference with the assistant-commissioner before determining on the proposed, and as to his general course of proceedings.

It has been a general practice with each assistant-commissioner, before finally determining upon his recommendations with relation to any district, to convene a meeting of the parties the most deeply interested in the proposed arrangements, namely, the principal owners and rate-payers and parish-officers. At this meeting he has explained the measures which it was his intention to recommend to the Board for adoption, and has invited the exposition of any objections, and the suggestion of any additions, to those measures.

It is satisfactory to us to be enabled to state, that in scarcely any instance have the measures thus sub-

mitted for a change of system in any district failed of obtaining the concurrence of a large majority of the meeting. In the greater proportion of cases the measures proposed have met with almost unanimous approbation.

Where dissent has been expressed in regard to the measures finally recommended by the assistant-commissioner (and such cases which have hitherto occurred in some single parish dissenting from a union with adjacent parishes), we have made it a practice to hear the statements of the dissentient parties, and to weigh any evidence which they have adduced upon the arrangement in question.

In the course of the subsequent proceedings, we have admitted of modifications as to the time and mode of making the proposed changes: but in endeavouring to decide solely upon the evidence of the permanent good to be accomplished, and not upon the predilections and conclusions of individuals, commonly deduced from the narrow field of observation, their own parish, and warped by private interests, we have not as yet felt ourselves called upon, in consequence of such appeals, to reverse the main recommendations of any of our assistant-commissioners.

We have already stated, that in a considerable number of parishes we found the agency inadequate for the correct administration of even preparatory measures of relief. We have also stated that we generally found it bad economy of the public means and time to attempt to enforce the introduction of the out-door employment of able-bodied paupers at task-work, as a substitute to the adoption of the workhouse system. As the examinations for the advancement of that system proceeded, we perceived that, even in the cases of parishes possessing workhouses, or poorhouses capable of being converted into workhouses, it was almost an equally bad economy of the public time and means to re-organize separately the arrangements for the administration of relief in the single parishes. Only in three instances, and those under very peculiar circumstances, have we deemed it advisable to place single parishes under the controul of boards of guardians (under the provisions of the Poor Law Amendment Act) in preference to uniting them with other parishes.

As the Statute under which we act leaves to our option various modes of proceeding with any parish, and allows us either to permit the parish to remain as at present constituted, or to place it under a board of guardians, or to unite it with other parishes for the use of a common workhouse, or for other purposes, we consider it our duty to set forth to your Lordship an outline of the reasons on which we found it necessary, immediately after the first investigations of the assistant-commissioners, to direct our exertions almost exclusively to the extension of the area or district of management, by the formation of unions of a greater or less number of parishes.

We have already intimated that in the smaller parishes the attainment of the separate means of administering relief upon a correct system of administration was impracticable, except at an expense greater than any probable saving that would accrue. Even in the largest of the parishes which have been examined by the assistant-commissioners, it is found that the means of an efficient administration are obtainable at a cheaper rate by the union of parishes. It has been proved that by the union arrangements these, as well as the smaller class of parishes, may be provided with the permanent advantage of a well-regulated workhouse, at a ratio of expense which, if the workhouse were to continue empty, would, in our belief, be more than compensated by the saving

which would be effected during the first few years, or by its effects upon the character and condition of the labouring population.

It has also been proved that the expense and loss of time in building new workhouses may, in many cases, be saved, by a union of parishes and the combination of their existing workhouses and poor-houses, by assigning one or two classes of the paupers to one of the separate workhouses within the district, which house would be unsuitable to the more extended classification of paupers required even for a single parish.

The next circumstance by which we have been influenced in the general formation of unions is the evidence of the superior economy in providing the necessary establishment of paid officers, and in the purchase of the supplies of provisions. In several of the unions the expense of management by paid officers, giving the whole of their services to the parishes united, is found to be less than the personal expenses heretofore charged to the rate-payers by the unpaid annual officers. With relation to those parishes where paid officers are already engaged, we need not specify the means of reduction in a union of twenty parishes, by the substitution of one complete establishment of paid officers for the twenty incomplete establishments for the separate parishes.

The extension of the area of management has proportionately increased the facilities for obtaining fitting officers, inasmuch as it is proportionately easier to find one fitting man than twenty, or to find one fitting officer for a union of twenty parishes, than to find twenty fitting officers for twenty single parishes. The peculiar qualifications required, and the difficulties so frequently experienced in finding proper officers at the outset, even in the new unions, have to our minds increased the importance of the extension of management for this purpose. An object of still greater importance at the commencement of a change of a system is attained by this extension; namely, the increased facility of collecting and enlisting the services of gentlemen who are peculiarly qualified to superintend an improved administration of relief.

It results from the union of parishes, that by substituting for the purchase of goods in the separate parishes, at the instance of the parish officers or of the vestry, purchases of goods for the whole union, almost as many sources of inducement to mismanagement are abated as there are parishes united. The pecuniary saving in the purchase of provisions when the purchases are made by contract for the whole union, on open tender, we have found to bear almost a direct proportion to the extent of the contract.

Another advantage of extended management has been manifested in the course of our proceedings, namely, the abatement of the influence of local jealousies and animosities.

In the course of some of our earlier proceedings under this commission, it was found that parishes which entertained strong objections to a union with the parishes immediately adjacent, expressed to our assistant-commissioners a preference for a union with distant parishes; and on perceiving that, from the increased size of the union, the parishes objected to would not constitute a majority, the dissentient parishes withdrew all objection, and expressed a zealous acquiescence in the change of system. The extension of the field of management was not only viewed as a resource for abating the animosities generated by the old system, when parish was at war with parish, but as a resource also against pernicious animosities between class and class, and as a

protection to individuals against the imposition of undue burthens. In the single parish, and especially in the small parish, the whole management was frequently warped to serve individual or sinister purposes. The administration of relief and the collection of rates were often so managed as to charge or exempt unduly some particular individual or class. It was soon perceived that the new boards of guardians, comprehending the magistrates of a district and the leading proprietors, would constitute a tribunal which could not be swayed by the petty interests or feelings which were dominant in the smaller district.

In another part of the field of administration, of equal importance, so long as it may be expedient that out-door relief should be continued, the extension of the district of management is found to be equally efficient in abating the mischievous influence of local interests.

Where the districts are small, the dispensers of relief act more closely within the sphere of their own connexions; proprietors are more frequently called upon to decide upon applications from their smaller tenants or dependents, or from the connexions of their dependents; occupiers who serve parochial offices are exposed to solicitations from their own labourers; and all retail shopkeepers have too frequently to decide upon claims to relief preferred or supported by their own customers. Those officers who would not deviate from the strict path of duty are exposed to serious sacrifices, from giving offence to one or the other class of applicants by the rejection of their claims, whilst strong temptations are held out to other officers to obtain popularity or further their private interests at the expense of the great body of rate-payers. In the larger districts we have generally found a majority free from the undue interests prevalent in narrow localities. We may cite the following passages from the evidence of the Reverend Charles Turner, of Wendover, a county magistrate and a member of the Board of Guardians of the Wycombe union, as illustrative of the general testimony in favour of the extension of the districts for poor-law administration:

"Have you felt any inconvenience, or derived any benefit, from the circumstance of the Wycombe union being so large as to consist of thirty-three parishes, and to be sixty miles in circumference?—I think we have derived great benefit: there being so many guardians from distant parishes acting on so large a scale, the possibility of intimidation and of favouritism is entirely destroyed. The paupers of the several parishes finding that all around them are treated alike, more readily submit to the law than they did under the vestry system, where they could make comparisons between theirs and other parishes where they received more. It was a common thing to have complaints made to me that they were ill-treated, because in some adjoining parish more money and less work were found. I also find this consequence, that from the extent of district great experience and knowledge are brought together, and concentrated in one operation; so that if one parish is in error as to any point of management or fact, it is corrected by the superior intelligence and information of some other parish. There is much more intelligence in a Board of Guardians than in a vestry, the Board being composed of the gentry and most respectable inhabitants of this large district, whose attendance is regular and as close as can be expected. Besides, the Board of Guardians will be a continuing body, gathering information and storing it up as they go on, whereas the management by overseers was one of continual apprenticeship, each year having a

new man; and although one overseer might introduce a good system, the next appointed might entirely destroy it."

"Shall you find any inconvenience from the workhouse of the union being distant from your parish?—No other inconvenience than in sending the pauper to it. To counterbalance that, I think the distance will operate as a superior check upon application for relief from this distant part of the union; for though a pauper of idle habits may make an experiment and try the workhouse, if in his own parish, he will I think have great reluctance to be sent to such a distance. I think in fact the very distance will act as an incitement to industry. This is one of the reasons why I prefer the Wycombe union, although our parish is far distant from the workhouse."

It is unnecessary to enumerate or describe all the considerations which have influenced us in determining the extent of unions. The most convenient limits of unions which we have found has been that of a circle, taking a market town as a centre, and comprehending those surrounding parishes whose inhabitants are accustomed to resort to the same market. This arrangement was found highly convenient for the weekly attendances of the parish officers, and some portion of the guardians and other auxiliaries to good management were derived from the town itself.

A further cause of limitation regarded by us at the outset was, that the field of management should not be so large as to prevent the members of boards of guardians embracing the whole of the details, for the control of which they should be responsible. As the business becomes methodized, the smaller unions may admit of further extension. As a proof of the increasing perception of the value of the extension of the scale of management, we may mention the fact of the readiness with which boards of guardians, constituted under Gilbert's Act or different local Acts, have consented to the dissolution of the unions over which they presided, the consent of a majority of two-thirds of the whole body of guardians being made necessary in such cases. For examples, we may refer to the statements relating to the dissolution of incorporations in the Hundreds of Suffolk, given in Mr. Mott's report, and also to the statements with relation to the dissolution of the incorporations in Kent, given in Sir Francis Head's report.

The new unions established having been frequently supposed to be analogous in their principles to the older incorporations, we would here observe that the principles of poor law administration which are sanctioned by Gilbert's Act, and by most of the local acts of incorporation of the same period, have been so mischievous in their operation, and are so much at variance with the principles established under the Poor Law Amendment Act, that we have invariably felt it our duty, as an indispensable preliminary to any beneficial change of system, to advise the immediate dissolution of the unions formed under the authority of those acts.

By the 29th section of Gilbert's Act the use of the workhouse was confined to children, and "such as are become indigent by old age, sickness or infirmities, and are unable to acquire a maintenance by their labour;" thus it excluded from the operation of the workhouse system the chief class to whom it can be beneficially applied. Although by the 31st section of the Poor Law Amendment Act, this section, or so much of Gilbert's Act as "limits the class or description of persons who shall be sent to such poorhouse or workhouse," is repealed, the 32d section of that act yet remains in force,

By this last-mentioned section it is provided, that "if in any parish, township, or place, any poor person or persons who shall be able and willing to work," (which may properly be read, who shall "profess" himself willing to work, for there are no means provided of testing his willingness where he makes a fraudulent application in the prospect of no work being to be found for him), "but who cannot get employment" (which can rarely in practice under this act be ascertained,) "it shall and may be lawful for the guardian of the poor of such parish, township, or place, and he is hereby required, on application made to him by or on behalf of such poor person, to agree for the labour of such poor person or persons at any work or employment suited to his or her strength and capacity," not in the workhouse, but "in any parish, township or place near the place of his or her residence." Thus the person, in a natural state of things the most interested in finding work, and who is the best able to do so, and to judge of what is suited to his own strength and capacity, is exonerated from the necessity of seeking work, which is imposed upon a person less interested and usually possessed of the least means of finding it. In one case of a threatened tumult of able-bodied paupers, who were dissatisfied with the amount of wages which they received from the parish, our assistant-commissioner communicated to them offers of regular employment for themselves and families in a manufacturing district, at wages at least double the amount of those which they had at any time been accustomed to receive when in work; but they refused these offers, and determined to remain in the parish, (which was one under Gilbert's Act), and demanded that employment near their residences should be found for them by the guardians, in compliance with the section we have recited. But where, in the view of the provision in question, labour cannot be found "near the residence" of the pauper, and the guardian is called upon "to agree for the labour of such poor person," (and it is to be presumed the ordinary employer of labourers is intended as the person with whom the agreement is to be made), the agreement can only be made upon the terms of giving to him the labour at such a rate below the market price as shall serve as an inducement to take that of which he is not at the time in need. Under these circumstances, the employer of labourers is furnished with the most mischievous inducement to throw them upon the parish, in order that, as paupers, their labour may again be offered to him at a low rate. The provision requiring that the labour shall be found near the residence of the pauper, has a further tendency to ensure to the employers of labourers within the bounds of that vicinity the command of the labour market. The guardian (himself often an employer of labourers), being subjected by the 35th section to a penalty if he neglect or refuse to provide the labour, or, in the words of the 32d section, "agree for the labour of such poor person or persons," has usually no adequate inducement, and but little means, to exert himself against such proceedings, the pecuniary consequences of which are divided amongst the great body of the rate-payers. The discontent of the pauperized labourer is averted by the following words of the 32d section, by which the guardian is bound "to maintain or cause such person or persons to be properly maintained, lodged, and provided for, until such work can be procured," (no definition being given of what the proper maintenance, lodging and provision are :) "and, during the time of such work, to receive the money to be earned for such work or labour, and make up the deficiency, if any; and if the same shall happen to ex-

ceed the money expended in such maintenance, to account for the surplus, which shall afterwards, within one calendar month, be given to such poor person or persons who shall have earned such money, if no further expenses shall be then incurred on his or her account to exhaust the same."

No period is defined during which the guardian shall be compelled to do all these things for all the persons who, professing their willingness to work, and alleging their inability to procure it, may require them to be done. The incorporations under this act, and the other incorporations formed under acts embodying the same principles, we have generally found amongst the most deeply pauperized of the districts which our assistant-commissioners have examined. The provision of the nature of a tariff, or, as it is termed in the rural districts, the "rake up," is followed by the deterioration and discontent of the pauperized labourers, by the increased burthens of the rate-payers, and the train of disorders which have already been submitted to the consideration of the legislature.

The intervention of some fortunate circumstances, and especially of the provisions we have adverted to not being so well understood as the law in general operation, have averted in some incorporated districts, and mitigated in others, the consequences of the principles embodied in Gilbert's Act; but we feel it our duty to endeavour to arrest the vicious tendencies of those principles, by using our influence to accelerate, as much as possible, the dissolution of all such unions or incorporations.

As a proof of the increasing perception of the value of the extension of the scale of management, we may state that the cases are numerous in which single parishes have remonstrated against being excluded, or have expressed dissatisfaction at the unavoidable delays in uniting them with others, and extending to them what they perceived to be the benefits of the act. In the few instances in which any persevering opposition has been evinced to the arrangements on the part of any individual parishes, we have reason to believe that this opposition has resulted chiefly from misapprehension of the provisions of the act, and of the object of the proceedings which were taken under the authority of this commission.

It may be a point of importance here to state, as regards our future proceedings, that although in the districts comprehended in the new unions, we have met with several parishes where the general management is greatly in advance of any management which we could expect to enforce at once in the other parishes included within the same union, yet we have in no instance found adequate reason to omit the best-managed parish from an union, on account of its management being relatively superior to that of any parishes remaining under the old system.

In the first place, we have found, as was stated in the report of the late Commissioners of Inquiry, that the continuance of good management in such parishes is generally dependent on the continuance of the life or services of some one individual by whom the beneficial management was introduced. By uniting such parishes, and subjecting them to the improved rules, administered by efficient establishments of paid officers, we consider that we ensured comparative permanency to the good management already introduced. We were also assured, from the evidence presented to us, that the economical results and other benefits of that management might be extended, either by a reduction of expenditure for management, a smaller amount being paid as a contribution for the more efficient union establishment, or by the

cheaper supplies of the workhouses consequent upon contracts upon a larger scale.

To these considerations were added the inducements arising from the probability that the influence of those individuals who had effected improvements would continue to be exercised in carrying into effect the like improvements in the other parishes united. Within the unions already formed are included the parishes of Cookham, White Waltham and Swallowfield, in Berks; Hatfield, Sandridge, Welwyn, Berkhamstead, in Herts; and other parishes honourably distinguished for the lead which they have taken in improving the poor-law administration.

The advantages for the sake of which the best-managed parishes in the districts examined have been included in unions, do not comprehend other and more remote advantages which may be anticipated as derivable from the attainment of uniformity of system, namely, as a means of preventing the discontents which arise on the part of the paupers from a comparison of their own with other districts more profusely managed, or of diminishing the motives for shifting from places less profusely managed to places where the profusion is greater; neither do the advantages, on account of which the assent to unions has been given in such cases, include those advantages derivable from uniformity in bringing the whole management more completely within the control of the legislature.

We have great satisfaction in being able to state, that from the perception of the immediate advantages of the union to the parishes which were found to be the best managed, our determination to unite them has generally obtained the acquiescence and support of the individuals to whom the parishes in question, and the public at large, are so deeply indebted for originating and conducting the beneficial changes of system which served as guarantees of the correctness of the remedial measures adopted by the legislature.

That the immediate advantages to such parishes resulting from the formation of unions should be so generally perceived, and that the measure should be supported by individuals who have given the highest proof of practical acquaintance with sound principles of administration, we submit as evidence justificatory of the confidence we feel in our present course of proceeding, which aims at the general extension of the field of management under the control of boards of guardians. The soundness of the decision which includes in unions parishes standing the highest in point of management, and where the progress in amendment is the most rapid and complete, we submit decides *à fortiori* against the claims to exemption of any other parishes on the grounds of the voluntary adoption of the principles of management sanctioned by the legislature, and prescribed in detail under our rules and regulations.

Concurrently with the extension of the districts of management, we were called upon to fill up the outlines of the constitution of the board of guardians, and of their powers and duties as traced by the legislature.

The first subject of consideration presented to us in connexion with these functionaries created by the Poor Law Amendment Act, related to their mode of election.

Under the old law, as it is in force in most of the un-united parishes, a large proportion of the mismanagement, the profusion, and the proceedings at variance with the interests and feelings of the majority of rate-payers, is traceable to the difficulties thrown, by the mode of election, in the way of the control of the majority of persons the most deeply interested.

In the largest parishes, with the most numerous constituents, and with the greatest facilities hitherto offered to rate-payers to exercise a general control over the management, we usually find that the greatest number of voters by whom any election is determined constitute only a minority, and usually a small minority, of the whole body of rate-payers; and in the rural parishes, where the population is widely scattered, we frequently found the management in the hands of a very small knot of individuals, whose residences enabled them to attend without inconvenience the place for the transaction of parochial business. The larger rate payers and the persons the most deeply interested, those engaged in trade or otherwise occupied, could not abandon their occupations to attend to their interests in parochial management, without greater prejudice to their more immediate interests in the pursuit of their ordinary occupations. The results of these circumstances are too frequently found to be, that the most wanton profusion and jobbing were maintained in a state of notoriety to the whole of the rate-payers; and this profusion was accompanied by proportionate mismanagement of the paupers, and a prejudicial influence exercised upon the condition of the labouring classes.

Unless some remedy had been provided for this defect, it appeared clear that the parochial management must have continued subject to the evils to which we have adverted. We assume that it was with a view to abate them that the legislature provided that "the votes shall be given or taken in writing, collected and returned in such manner as the said commissioners shall direct."

The principle upon which we have endeavoured to follow up this important enactment has been, that it was our duty to extend to all on whom the legislature conferred the right of voting the greatest facility for the exercise of that right; and as one of the first regulations, with this view, we prescribed the means of taking the sense of the rate-payers and owners of property, set forth in the form of declaration of a union, under a board of guardians, which we have given in the appendix. By these regulations, it is provided that voting papers, in the form thereto annexed, (also given in the appendix), shall be left by parochial officers at the house of each rate-payer. This paper must be left with him one clear day. He must set forth in his own handwriting the name of the person or persons for whom he votes, and the vote thus certified is called for, after the lapse of a day, by the collecting officer.

We must observe upon the preceding statement, that by leaving the vote to be certified at the house of the voter, he is enabled to perform the act with more calmness and deliberation than we believe is obtainable by any mode of voting in ordinary practice. As the progress of the votes is unknown, so are the motives to use undue means to affect the result diminished, and the voter is proportionately shielded from the use of those means. Though the process required additional officers for the collection of the votes, we should nevertheless consider the arrangement economical; for, supposing one officer should be capable of collecting within the prescribed time three hundred votes, we deem it the best economy of the public time that one officer should be required to go to three hundred persons and collect their votes, in a form which at the same time serves for the formation of the most perfect register, than that three hundred persons should, in order to exercise their franchise, be taken from their business and to a distant place of election,

and lose their time amidst tumult and the liability to insult in attending to have their votes registered by one officer.

In a great majority of instances in which the new boards of guardians have been formed, the elections have been made unanimously. In the instances where contests have taken place, this mode of voting has been tried, and on trial has justified the anticipations with relation to it. We may cite as an example of a trial under somewhat adverse circumstances, a recent contested election of a board of guardians for the parish of St. Martin in the Fields. The number of rate-payers qualified to vote at that election was 1,500. The greatest number of persons who had voted at any previous contested election, when the most strenuous exertions were used, was 750. The number of persons whose voting papers were collected at the recent election was 1,522, including, however, 149 owners who voted for the first time under the authority of the act.

Experience has suggested some additional facilities, which we trust will render this method of election still more complete for its purposes. A very large proportion of the votes collected in the instance above mentioned was declared to be invalid for various other causes, in no way affecting the merits of the arrangement as affording the greatest facilities to the largest number of inhabitants to record their votes.

We trust that by the other election arrangements we have adopted, the inducements to pack meetings for the purpose of carrying elections will be prevented. By means of a nomination-paper any rate-payer may nominate a candidate, without the necessity of attending the meeting, and without the possibility of the nomination being defeated by a show of hands at a packed meeting. If there be no more candidates than the requisite number to fill the vacancies, the candidates thus nominated will, under the regulations be elected as matter of course. If there be more than the required number, no show of hands is taken, but the sense of the rate-payers is ascertained by the means above stated.

From the mode of election thus enabling us to ascertain in the most rapid, peaceful and certain manner the sense of the great majority of the owners and rate-payers of any district, as indicated in the choice of guardians, or on other occasions, we derive satisfactory assurances of extensive local concurrence in the proceedings under the act.

The regulations which we have made for settling the manner of proceeding by the boards of guardians in conducting their business, and the provisions for determining the powers and duties of the paid officers first appointed, together with the rules for administering relief first prescribed in the new unions, are set forth in the appendix.

The provision of proper workhouse accommodation, and where accommodation was available, the enforcement of proper workhouse regulations, were generally found to require extensive arrangements. The first regulations for the administration of relief by the boards of guardians were therefore confined to the gradual substitution of relief in kind for relief in money, and to a few simple rules for the regulation of out-door relief, which had been extensively tried and had operated beneficially; but which would not involve a sudden or violent transition from the usual practices in the parishes united.

We shall subsequently advert to these rules when we shall have to state the results of the new unions.

To make the transition still more easy, a distant day

has usually been fixed for the peremptory operation of the rules, leaving an interval for their gradual enforcement, according to the discretion of the guardians. In some cases this period has been further extended at the request of the boards. In many cases modifications of the rules, either as to their matter, or as to the time of their enforcement, appeared necessary to adapt them to the wants of the district; and as yet these regulations have not been promulgated as general rules. In districts, where the administration of relief is in advance of the pauperized districts, the rules have been modified to promote a further advance. In the Cookham union we have ordered that all out-door relief to the able-bodied shall be discontinued. We have established that in the parish of Sandridge no out-door relief whatsoever should be allowed.

The whole of these arrangements we contemplate as the subject matter of revision, for the purpose of making the most speedy advance to a sound system that the circumstances of each district will allow.

Immediately after our arrangements respecting the preparative alterations of the out-door relief were completed, the provision of workhouse accommodation was presented for our consideration.

We are aware of the objections frequently made to the erection of new workhouses, and have carefully resorted to the means which have occurred to us as alternatives; we are also aware of the danger of unnecessary expenditures in providing for the accommodation of out-door paupers, the extent of whose acceptance of relief in a workhouse could at the best only be conjectured.

It will be seen, on reference to the tabular forms for exhibiting the results of the Assistant-Commissioners' inquiries, that we directed them, in every parish containing a workhouse or poor-house, or cottages, to examine to what extent those houses were applicable. If they could not be considered useful for all classes of inmates, whether they might not be made useful for only one class of paupers, and to what extent? Whether they could be rendered useful by alterations at any reasonable expense? If there were no workhouses in the parish or district, we next directed their inquiries as to the practicability of hiring and adapting some convenient building, or of purchasing one, if none could be hired? In general, it is only in the absence of these several means of accommodation, that we entertain the question of building a new workhouse.

We found it necessary for the purposes of the act, to obtain, with professional aid, plans for the construction of workhouses of different sizes, capable of holding from one to five hundred paupers. These plans were adapted to the attainment of the classification and the enforcement of the principles of management which we deemed essential: we have not, however, prescribed the general adoption of these plans, believing that deviations from them might be necessary to meet local circumstances, as to the extent of ground and description of materials available; and that, although they had been prepared with great care, we could not assume that in any point they were incapable of further improvement. We have therefore left to the boards of guardians the adoption of these, or the preference of any other plan which contains the requisite provisions for the classification of the workhouse inmates, and for the enforcement of what we deemed essential regulations.

We have given in the appendix copies of the plans which differ in arrangement, together with a copy of

a plan devised by Sir Francis Head, which has been adopted by several of the unions in Kent.

We have great satisfaction in being able to report that in several extensive districts, we have been able to direct the change of system without incurring any considerable expense in the erection of new buildings. In the whole of West Sussex only one new workhouse has been found necessary. In the county of Berks three new workhouses have been found requisite. In Hampshire seven; in East Kent ten. In upwards of 2,000 parishes which we have formed into 112 unions, the total number of new workhouses at this time in preparation is thirty-seven.

Before we conclude this subject, we beg to advert to one addition to the act which we consider it important should be asked of the Legislature during the present session. In the course of our proceedings great inconvenience has been experienced from the terms of the 26th section of the act, in which it is enacted, "that it shall be lawful for the said commissioners, by order under their hands and seal, to declare so many parishes as they may think fit to be united for the administration of the laws for the relief of the poor; and such parishes shall thereupon be deemed a union for such purpose, and thereupon the workhouse or workhouses of such parishes shall be for their common use."

The parishes where expense has been incurred in the erection of a workhouse, not unreasonably consider that in the union arrangements they are entitled to an allowance proportioned to their greater contribution of the means of advancement. In unions where it is found necessary to build additional workhouses, the parishes whose workhouses have been appropriated to the use of the union have still stronger claims to be exempted from contributing to the expense of new workhouses. Legal doubts are entertained whether in such cases we have the means of adjusting those claims, or of allowing the parishes so situated any remuneration in consideration of the use of the workhouses.

We beg to state to your lordship, that it would greatly facilitate our future proceedings in the existing unions, and the formation of new unions, if before the close of the present session of parliament an enactment were passed to remove the existing doubts, and enable us to settle equitably the terms of the union to the satisfaction of the parishes in question.

We must not, however, omit to observe, that the claims in question are not correctly admissible as claims for exemption from increased charges; they are more properly claims for increased proportions of benefit. We are aware of no case in which it would not have been of advantage to the parish possessing a workhouse to have given up its workhouse, without any compensation whatever, rather than that it should be excluded from the union. The principle of the proposed adjustment is, that those who, by the erection of workhouses, have made the greatest exertions to abate the evils of pauperism, are entitled to a proportionate share of the advantages of the change, as compared with those who had made less exertions, or no exertions whatever. At the time of the passing of the act, the apparent difficulties of prescribing the terms and procedure for settling the claims in question, were supposed to more than counterbalance the claims themselves. We are assured, from our subsequent experience, that, with the additional powers sought for, the claims may be readily determined to the satisfaction of all parties, without litigation.

In addition to the preparatory rules for the admini-

nistration of the out-door relief in the new unions we have found it necessary to prescribe for those unions possessing workhouses regulations comprehending what appeared to us to be the essentials of workhouse management and classification. We have not, however, in the present state of our proceedings thought it expedient to promulgate these regulations as general rules and regulations. We have only applied them in particular cases, with local modifications suggested by local inquiries.

One of the regulations which we have introduced, as an essential to good workhouse management, is the separation of the sexes in separate apartments, usually of the same house. The enforcement of this regulation having occupied in some degree the public attention, and it having been contended that an exemption from the general rule should be made in favour of the married paupers, we beg to state the ground upon which we deem the strict enforcement of the rule to be essential.

The first point to which we claim your lordship's notice on this subject, is the fact that in nearly all the workhouses in the larger metropolitan parishes, and in the well-regulated and efficient workhouses throughout the country, the rule which we propose to continue has been acted upon for many years. In all those examples, which have illustrated and developed the success of an efficient workhouse system, whether those examples have existed previously or subsequently to the passing of the Poor Law Amendment Act, the rule has been enforced strictly, and without reservation, and in every instance with the best results.

Where all the labourers of a parish or of a district receive relief from the rates, and where large proportions of them are wholly dependent upon the parish during long periods, to those who, not having become acquainted with all the operations of the allowance system, and who believe relief in aid of wages to be absolutely necessary, the practicability of enforcing a measure for abolishing out-door relief, which is presented to their minds as one for separating man and wife, and placing the whole or the greater part of the population in a workhouse, will be as strongly doubted as its justice and policy. An examination of the proceedings under the commission would display the grounds of the error, to which we can here only advert. In the report to us from Mr. Power, will be found a full and distinct statement of the circumstances under which he found, within the districts assigned to him, that the apparent surplus was unreal and factitious. In the same report, and also in the reports from Messrs. Hall, Gulson, and Gilbert, will be found statements of the modes in which, under improved management, the apparent surplus is absorbed or dissipated.

All the past experience of well-managed workhouses proves that the continued residence in the workhouse of any considerable proportion of the usual out-door paupers would be but temporary.

In none of the new unions where the workhouse system has been applied have any considerable number of married couples, who were out-door paupers, accepted relief within the workhouse. The instances of the reception of married couples, even temporarily, into the workhouse, where the separation of the sexes is enforced, are extremely rare; we can only therefore contemplate the necessity of submitting to the rule as likely to occur in a small proportion of the cases of the out-door paupers, and in those cases only as occurring for a short time. Permanent domiciliation in a workhouse is the result we least of all contemplate as arising from the proposed arrangement. Should that result occur in any peculiar loca-

lities, we should consider that the cases called for the application of other remedies, and amongst them, of a migration to a field where the demand for labour is more extensive and certain. We therefore apprehend that it would be a most dangerous experiment were we to authorise such a new and extensive qualification of the recognized workhouse system, as might have the effect of domiciliating and reconciling to a habitation in a workhouse, a class which experience clearly proves, would not otherwise be induced to accept of this mode of relief.

All the efficient existing workhouses throughout the country are built with large sleeping wards, which are separately appropriated to inmates of each sex. An alteration of this arrangement, and a relaxation of the rule, could not, therefore, be complied with, without permitting, and even compelling, on the parts of married couples, the violation of all decency, without making extensive alterations in the construction of the whole of the existing workhouses throughout the kingdom, and without subjecting the inmates to more severe restrictions, in order to secure the observance of common decency and order. The details of the facts which have come to our knowledge respecting those places in which the ordinary rule has been violated, and the indulgence contended for has been granted, are such as it would be impossible to allow to appear in any public document. The consequences which followed, even in those instances where separate apartments have been provided for each couple, are such as to prove that the rules could not be relaxed in the manner proposed without making each establishment an asylum for the encouragement of improper intercourse between the sexes. Under these circumstances, we cannot admit that the charge of undue severity attaches to the continued and more complete enforcement of the rule for the separation of the sexes during the temporary residence in the workhouse, as a condition of being relieved from the danger of perishing for want. The temporary separation of married persons, it must be recollected, is an inconvenience which many thousands of the married, in every rank in society, undergo, not as the condition of an escape from any imminent evil, but for the purpose of sustaining or advancing their condition in society. Neither can we admit that a separation which has ever been endured without complaint of peculiar hardship by all who have served in the army or in the navy, can be justly regarded as too great a sacrifice for those who, as paupers, are relieved from the pressure of destitution.

It will be seen from the foreign communications to the late commissioners of inquiry, that the rule is adopted in the most efficient workhouses in the United States, and generally in every civilized country in Europe where a system of relief analogous to relief in a workhouse prevails.

These observations we have submitted apply to the cases of able-bodied married couples. The grounds for the application of the rule to the aged and infirm are, that such separation is requisite for their comfort and appropriate treatment. The detailed grounds in favour of the rule are similar to the grounds for the practice which has ever prevailed in the hospitals, of placing the sexes in separate wards. Some of these grounds are set forth in the following examination of the master of the workhouse at Aylesbury, from Mr. Gilbert's report:

*Evidence of Benjamin Quatermain Simons.*

"I am master of the workhouse at Aylesbury, and have been ever since the house was built, five years

last November. The rule of the house is to classify the inmates, and we always keep men and wives separate. In the old house the men and their wives used to live together. Amongst these there were John Evitt and his wife, James Hearn and his wife, the only married couples who were removed into this new house. After being in the new house, living together as they had done in the old house, for about six months, (the other married couples who had newly come into the new house being separated), Evitt and his wife, and Hearn and his wife, requested that they might be permitted also to live separate; and Hearn's wife also requested that she and her husband might live separate. The reason they gave was, that being old and afflicted people they disturbed one another at night, and could not be so well attended upon as if they were separate. The vestry consented to let Evitt and his wife live separate, but having no nurse that could wait upon Hearn, we were obliged to refuse their request. Evitt and his wife lived separate all the time they were in the house, up to the time of the wife's death, and Hearn and his wife continued together till the husband died. The wife of Hearn made many and frequent applications to the parish to be permitted to live separate, but we had no one that could attend upon him. She stated that her husband's infirmities soured his temper, and made them quarrel and disagree. Neither Evitt nor his wife ever requested, after they were separated, to be allowed to live together again.

"Another case of the same sort is a man and his wife belonging to our parish, who had been living in St. Margaret's parish, the man in the infirmary and the woman in the workhouse. Their names were Ironmonger; they are still in the workhouse. They requested to live separate, and still do so, with their own desire. The wife is bed-ridden, and requires nursing like a child. It is necessary to have a woman to nurse such a person. If her husband was with her, no woman could, in his presence, nurse, and she must either remain in a state of filth and neglect, or she must live separate from her husband.

"Do you conceive it possible, without separation of the sexes, to manage a workhouse consistently with the comfort of the aged and control of the able-bodied?—No, I am sure you cannot, Sir. If a man and his wife are together they must have a separate room to themselves, or there would be the gross indecency of many men and women sleeping, undressing, and doing the necessary offices of a bedroom in the presence of each other. The effect of a joint-room, too, would be that the paupers, men and women together, being reduced to a state of total want of decency, would soon have common and promiscuous intercourse.

"If one room was had for each man and his wife, it would be impossible to find room for them in the large parishes. We always find that paupers in separate rooms are dirty in the extreme, and a set of servants would be necessary to keep the house clean. I am clearly of opinion that all who try to manage a large workhouse without the division of the sexes, will fail in making the aged comfortable, the disorderly obedient, or keeping the house in a state of healthy cleanliness."

This evidence sets forth the common opinion of all other practical witnesses who have communicated upon the subject with the board.

We cite the following passage from the report of Mr. Hawley, as illustrative of the scenes not unfrequently presented to our assistant-commissioners. These scenes exhibit the cruelties and various evils

which would be incurred and maintained by yielding to the opinions of those ill-informed persons, who, without inquiring, declaim against that separation of paupers in different houses or in different apartments, required in the workhouse regulations, which forms the only means of preventing such evils:

"My time during the week has been engaged in visiting the workhouses of the proposed union, and it would afford me a pleasurable feeling could I send even a partially satisfactory report of their condition and management. Every visit paid to workhouses, as they are now constituted, confirms the necessity of interference by the powerful arm of the new law, to work a reformation in systems and habits which are a disgrace to civilization and humanity; and I would adduce the workhouse at Ewhurst as a sad example of the evil and misery which flow from neglect, self-interestedness, and want of feeling in those to whose hands the control of parish affairs has hitherto been confided. In the day-room I found a group of children sitting in listless idleness, uninstructed in either moral or useful duties. One of the bed-rooms was appropriated to the reception of an aged man and woman and three girls; a third room was the sleeping place of a young woman affected with a certain loathsome disease, and in company with her were several boys and girls; in another, a violent female maniac, fastened with cords to a chair, was disturbing all the inmates of the house by loud and obscene exclamations. In a low dark garret, hot to suffocation, I discovered eight beds closely packed together, on one of which was sitting a lame pauper, inhaling as much air as an aperture, intended for a window, would admit; on another was stretched a poor wretched being, in the last stage of a consumption, emaciated and exhausted by disease, but having his sufferings aggravated tenfold by the hot and pestiferous atmosphere which filled the apartment in which he was immured. An instant order for his removal to a more airy apartment was complied with, with evident reluctance on the part of the governor, who seemed totally reckless as to the comparative state of comfort in which vice and misfortune should have been placed in this ill-conducted receptacle of paupers.

"A system founded on a more humane attention to the wants of the really distressed, and a stricter discipline towards the idle and dissolute, will forthwith be established in this union, and the conduct of the guardians to-day gave every assurance of a ready co-operation in carrying it into effect."

In the course of the earlier proceedings for the enforcement of the measures preparatory to the discontinuance of the allowance system, our attention was directed to the expediency of facilitating the migration of families of labourers from the southern agricultural, to the northern manufacturing counties.

Shortly after our appointment, letters were submitted to us from some eminent manufacturers in Lancashire, representing that in that district there was an increasing demand for hands, and suggesting the expediency of our promoting a supply from the heavily burthened rural parishes of the southern counties.

We need only advert to the fact, that in the rural districts, where the allowance system prevails, it is common to represent the whole of those who are for any considerable period thrown upon the rates as a surplus population. Until the system of making allowances in aid of wages, or of making the parish the labour mart is completely eradicated; until relief is given only under circumstances rendering the acceptance of it conclusive evidence of entire des-

titution: until the acceptor of is taken completely upon the parish, and this change of system has been made, not only in the single parish but throughout the district, and has been for some time in operation, we should, as at present advised, scarcely feel warranted in pronouncing on the reality of the strongest cases of an apparent surplus of population which have at any time been presented to us. We have had instances of parishes which appeared, *prima facie*, to be burthened with a surplus population of more than one-third, which surplus has been absorbed almost entirely within the parish itself, by the operation of the workhouse system.

Admitting, however, that there are parishes containing a real surplus of able-bodied paupers, which could not be wholly absorbed within the parish as a consequence of the change of system of administering relief, our present information leads us to hope that the greater proportion, if not the whole, of this surplus will be absorbed when the district as well as the parish is dispauperized. Nevertheless, in most districts are found large families of children, widows with young families capable of labour, but for whom there appears to be no immediate employment within the rural districts.

In considering the communications made to us by the manufacturers, the fact was presented to us, as established by most extensive inquiries made under the late commission of poor law inquiry in the rural districts, and the factory commission in the manufacturing districts, of the striking difference of the rates of wages received by the labouring population within the two districts. The rate of wages for families comprehending three or four working hands in the manufacturing districts is at least double the amount of the best wages obtained by families of the same description within the agricultural districts; and, moreover, the demand for labour at such wages is steadily increasing. So far as any proceedings for influencing the direction of the circulation of labour come within our province, which we conceive they do only under the very peculiar circumstances of the change of system which we are charged to conduct, we feel it our duty to the pauperized labourers themselves to direct them to the sources of the highest wages; and we believe that this course of proceeding will be conducive to the most enlarged public interests.

On these grounds we directed a circular letter, of the date of 2nd of March, to be sent to certain of the manufacturers in Lancashire and other districts, where we were informed that there existed the greatest demand for labourers. In this letter we offered to those who had a demand for labourers, to make the circumstance known in rural parishes containing families willing to migrate, from whom such a selection could be made as might meet the wishes of the employer. We also offered, as the manufacturer might prefer, either to supply him with such information as would serve to direct his own inquiries, or direct inquiries to be made from the minister and the respectable inhabitants of the parish, on such points respecting the past conduct of the persons willing to migrate, as would serve to satisfy him as to their general character and trustworthiness as workpeople.

The first trial of the measure was made in the parish of Bledlow, Bucks, where it had been represented to us that numerous families were subsisting in extreme distress, and where it was threatened that the lands would be thrown out of cultivation in consequence of the increasing burthen of the rates.

We found greater reluctance on the parts of the labourers to accept offers of employment than we anticipated. It had been previously made known

within the district that our proceedings were preparatory to the gradual abolition of all out-door relief to the able-bodied, and the introduction of the workhouse system; but we were desirous that the migration should be voluntary on the parts of the pauperized labourers. We had not sanctioned the withdrawal of their accustomed allowance, or countenanced any intimation of such a reduction as being likely to follow their refusal. That this might not be done, we directed the assistant-commissioner to communicate the offers personally to the families who were dependent on the rates. He went from house to house of the labourers' families of that parish who had stated that they were the most deeply distressed, who had in their public memorial addressed to the board, declared that they were then living only on 7s per week wages, obtained by families consisting of several individuals. To these he successively offered engagements for constant employment on terms ensuring about 24s. per week per family of four working hands, for the first year of their service, and 30s. for the second. But not one family could in the first instance be induced to accept the offer. The majority intimated that they would in preference, in the coming spring, renounce their "parish pay" rather than remove. After this general refusal, one family was persuaded to accept; before their departure another family accepted employment on the terms proposed. After these had departed and had tried their new situations, a number of others accepted the offers, making in all 83 individuals who migrated from that parish. Subsequently, a large migration took place from the parish of Princess Risborough and the example was followed in other places without our intervention.

The results of this experimental measure are stated in detail in the letters of Henry Ashworth, Esq., R. H. Greg, Esq., (our first correspondents,) in a letter from R. Beard Esq., and also in a report from Dr. Kay, our assistant-commissioner, to which we would direct your lordship's special attention for the information it contains relating to the Lancashire cotton district.

These results are in substance, that nearly the whole of the individuals who have migrated are now in constant employment in Lancashire, and earning collectively as families three times the amount of wages which they had at any time earned in the districts which they had quitted. They have been provided with superior cottages, which they have been enabled to furnish by means of advances of money from their employers, to be repaid by instalments from their wages. They have abundant supplies of fuel, at such low rates as to be enabled to enjoy the luxury of a fire to an extent unknown to the labourers of the southern counties. The head of the first family who migrated declared that not all the horses in Buckinghamshire should draw himself and family back to his parish. Similar expressions of satisfaction at the change were made by others of the heads of families to Dr. Kay. The employers of the workpeople have expressed themselves well satisfied with the conduct of these southern families, and have declared their intention of seeking families from the same districts in the event of their requiring additional hands. On the other hand, the migrants have been cordially received by the established manufacturing operatives. This circumstance is accounted for partly by their natural preference for their own countrymen, and partly from the fact that the adult operatives participate in the advantages of a supply of young working hands, as the increase is requisite for the advancement of their own more skilled labour. It has been reported to us, that so sensible have been the adult

operatives of those districts of the necessity of an increased supply of hands, that although they have sometimes been guilty of acts of riot to prevent the introduction of new machinery, scarcely any instances are on record where they have taken steps to resist with violence the influx of new hands.

The effect of the migration upon the parishes has been a proportionate reduction of the rates. It has been reported to us that in the parish of Bledlow, where the experiment was first tried, the rates were reduced one-half, mainly in consequence of the migration.

It appears from the inquiries of Dr. Kay, that new mills are in the course of erection; that old mills are about to be extended and completed during the next two years, requiring altogether 7,000 horse-powers of steam-engines to put them in action. For the service of these mills, many thousand additional hands will be required during that period. Some portion of this prospective demand for labour will no doubt be supplied from within the county; the hand-loom weavers it is hoped will be induced to avail themselves of the new markets for their labour; but from the best information which we can collect, it appears that this increased demand can be completely supplied only by migration from some other parts of the country. The success of the experiments which we have just related leads to the expectation that further supplies of labour will be sought by the manufacturers from the southern counties. In the instances stated, the channel of communication being opened, a further migration has taken place without our intervention. The manufacturer to whom the first families were sent, states, for example, in a subsequent communication, "I can now, without any trouble, supply myself from Bledlow, by mentioning to my Bledlow hands that I am ready to take more."

Such a course of spontaneous migration, without

the intervention of this board, or of any public authority whatsoever, is the course which we are most desirous of seeing in action. But the pernicious habits engendered under the old law, which confined the labourers and their families to their parishes, will require in other districts some care and exertions to overcome. We do not perceive how, in the instances we have mentioned, the reluctance manifested by the labourers to quit their parishes could without our intervention have been overcome. The same beneficial course will probably be found requisite in other pauperized districts where the advantages of migration are yet unknown.

To whatever extent it may be found expedient to promote further migration, we should in no case promote a removal of any labourers to the manufacturing districts where there was not a clear and specific demand for the labourers to be removed; and in all cases we deem the gradual absorption, family by family, preferable to the removal of considerable numbers. The expenses of these removals have, in the first instance, mostly been defrayed by the parishes from which the families have been removed. These expenses have been considered as relief. The expense of removal of 113 persons from Princes Risborough was 16l. per head.

At the time of framing the regulations for the new unions, and of considering the subject of migration, we also considered the measures requisite for the diminishing any possible surplus of pauper labourers, by facilitating foreign or colonial emigration. To this end we prepared the instructions set forth in the Appendix, and we pointed out the mode in which parishes ought to proceed, under the authority of the 62d section of the Act, to procure loans either from the commissioners of exchequer bills, or from private individuals.

The following Table displays the very small extent to which parishes have resorted to this provision.

| NAME OF PARISH.             | COUNTY.           | Amount raised or borrowed, either from the Exchequer Loan Office, or from private individuals. | Number of persons who have emigrated. | To what part emigrated.                       |
|-----------------------------|-------------------|------------------------------------------------------------------------------------------------|---------------------------------------|-----------------------------------------------|
| Hambleton .....             | Hants .....       | £ 300                                                                                          | 28                                    | Upper Canada.                                 |
| Ingoldesthorpe .....        | Norfolk .....     | 32                                                                                             | 4                                     | Ditto                                         |
| Great Ringstead .....       | Ditto .....       | 200                                                                                            | 27                                    | Ditto                                         |

Number of applications from parishes, 80.

It is a remarkable fact, that hitherto no demands for the sanction to emigration have been made to us from any of the parishes which have been wholly or partially dispauperized; nor have we at present any reason to expect that this cautionary provision of the legislature will be extensively used.

We have now to report, that at this period the total number of parishes which have been united by us since the 6th of December last, the date of the first union, and subjected to the progressive introduction of the new Act, is 2,066, constituting 112 unions. The population of the parishes united and placed under boards of guardians forms one-tenth of the population of England and Wales; but in consequence of the most heavily-burthened districts being selected for our earliest proceedings, the proportion of the rates affected by the change is one-sixth of the total amount of rates in England and Wales.

In the county of Kent eight old incorporations have been dissolved by consent; 211 parishes have been formed into 13 unions, which include the whole of East Kent.

In the county of Sussex five old incorporations have been dissolved, and 242 parishes, comprising nearly the whole of the county, have been formed into 16 unions.

Nearly the whole of Hants has been re-organized into 21 unions, comprising 275 parishes.

The whole of the county of Berks has now been united in 11 unions, comprising 176 parishes.

In the county of Oxford 185 parishes have been formed into five unions.

The greater proportion of the county of Bucks has been included in seven unions, comprising 162 parishes.

In the county of Suffolk three of the old incorporations have been dissolved, and 129 parishes have been united in four unions.

In the county of Northampton 153 parishes have been formed into seven unions.

In the county of Cambridge 61 parishes have been united into three unions.

In the county of Essex 91 parishes have been united into three unions.

Nearly the whole of the parishes in the county of Bedford have been united in four unions.

The whole of the parishes of the county of Hertford have been formed into 12 unions.

In the county of Norfolk, where proceedings have been recently commenced, 65 parishes have been included in two unions.

In Wilts two unions, comprising 45 parishes, have been formed.

In Middlesex one union has been formed.

In the county of Gloucester 37 parishes have been formed into one union.

The following return shows our progress in the number of parishes united during each month up to this period:—

| MONTHS.           | Number of Unions formed. | Number of Parishes united. |
|-------------------|--------------------------|----------------------------|
| 1834, December .. | 1                        | 14                         |
| 1835, January ... | 2                        | 44                         |
| February ..       | 17                       | 268                        |
| March .....       | 24                       | 443                        |
| April .....       | 15                       | 217                        |
| May .....         | 18                       | 319                        |
| June .....        | 19                       | 423                        |
| July .....        | 18                       | 338                        |
|                   | 112                      | 2,066                      |

Sutton Courtney placed under a board of guardians, 10, December, 1834.

St. Martin in the Fields, ditto 29, April, 1835.

Battersea, ditto, 15, May, 1835.

The complete statement of the pecuniary results fairly ascribable to the new act, or to our proceedings under its authority, could scarcely be made within the time in which it is desirable to present our report. A considerable number of the present parish officers being unlettered men, their returns are, as might be expected, extensively defective. In requiring any return from the 15,635 places at present managing their own poor, a considerable proportion of errors must be anticipated.

For the completion of the return relative to the condition of the several parishes, which we first called for from the parish officers, several thousand letters were required to obtain more correct answers than were first sent. The time occupied, including the additional letters required to correct mistakes and remedy neglect, in obtaining the annual return of poor's-rates printed by the House of Commons, has been seldom less than 12 months, and the extra expense of clerks has generally been about 450*l.* for very return. It will perhaps be deemed important by the legislature that correct information of the condition of the country, as to this department of expenditure, should be more readily available.

To the statement of our reasons for the formation of unions, we might have added, that we consider that the difficulty, in point of time, in obtaining correct information relative to the progress of the system, constitutes of itself a strong reason for the formation of unions for the administration of relief. When 30 or 40 parishes are united, and the administration placed in the hands of an establishment of paid and responsible officers, acting upon a correct system of accounts, it will be much less difficult to obtain one correct return for the whole union than returns for the 30 or 40 separate parishes. In proportion as the country is formed into unions, it will therefore become less difficult to obtain for the legislature information respecting the progress of the administration of relief, and also, for the use of this commission, such accounts of the past occurrences as will serve for their future guidance.

The very recent formation of a large proportion of these unions, and the circumstance that in another large proportion the measures adopted are chiefly preparatory, preclude us from stating more than the results of those unions of earlier formation, and in which the machinery for conducting the change of system was the most advanced. We have given in the appendix the general reports made by the assistant-commissioners of their proceedings and of the operation of the act within the field of their operations, up to the time of the consideration of this report. We have also added a variety of communications received from magistrates and the officers of unions, containing statements of the operation of the act within their respective localities.

The following is a tabular abstract of the statements of the pecuniary results in the early-formed unions, which have been brought into partial operation; the periods compared are corresponding periods.

| Name of the Union. | PERIODS COMPARED.                           | Number of Parishes from which Returns have been obtained. | EXPENDITURE. |             | DIFFERENCE. |           |
|--------------------|---------------------------------------------|-----------------------------------------------------------|--------------|-------------|-------------|-----------|
|                    |                                             |                                                           | 1834         | 1835        | Increase.   | Decrease. |
|                    |                                             |                                                           | £. s. d.     | £. s. d.    | £. s. d.    | £. s. d.  |
| Abingdon . . .     | Six weeks in May and June 1834-35 . . .     | 14                                                        | 502 14 5½    | 334 10 2    | 168 4 2½    |           |

In the populous and well-managed parishes of St. George Hanover-square, and St. Giles-in-the-Fields and St. George Bloomsbury, very considerable improvements in the administration of relief had been effected before the passing of the act. These and several other parishes were in a progressive state of improvement at the time we sent out our first circulars. In the returns from 172 parishes, the great majority state that they have to a considerable extent complied with the recommendations contained in the circular of the 8th of November. The results of the measures recommended, and chiefly of the substitution of relief in kind for relief in money: it appears that the poor rates have in the 172 parishes been reduced from the sum of 506,645*l.* in 1834, to 431,253*l.* in 1835. But the amount of weekly relief dispensed in these parishes in the last week of March 1834 was 8,280*l.*, whilst in the last week in March 1835 it was 6,214*l.*, showing an increasing ratio of reduction. It is observable that the greatest reductions have been made in the largest parishes. Whilst in 159 of the smallest parishes the reduction was only nine per cent. upon the previous amount of rates, the reduction in 13 of the largest parishes, comprehending a population of 787,000 persons, was 20 per cent. We believe that similar results will be found to have taken place in other districts.

So far as the change has proceeded in those districts which have workhouses, the reduction of the out-door relief has been accompanied not by an increase, but by a decided diminution, of the number of the in-door paupers.

We have directed our most anxious attention to the general effects produced by the change upon the condition of the able-bodied paupers, whose allowances in aid of wages have been discontinued. Careful inquiries have been made as to the subsequent condition of those who had refused to accept relief in a workhouse. In the Faringdon union, for example, all out-door relief was discontinued, and relief in the workhouse was offered to 240 able-bodied labourers. Of these, not more than about 20 entered the workhouse, and not one half remained there more than a few days; the diet in the workhouse being at the same time high as compared with the diet of

large classes of independent labourers. Mr. Gulson found, at the time of his inquiry, that the whole of these labourers had got into independent employment. On inquiry of some of the farmers who had previously represented to him that they had then no means of employing any additional labourers, he received for answer, that the additional employment was now given in consequence of the improved character of the labourer.

In these, as in other instances, the general results have in practice, been presented to us generally in the following order:—

When the allowance in aid of wages has been discontinued, and reception in a workhouse has been offered to the able-bodied labourers, the employer who had acquiesced in the system, or who still conceived that it was conducive to his narrow interests, perceives that all efforts to maintain it must be attended with the inconvenience of parting with labourers, some of whom probably are valuable to him for their skill, and others the most eligible as understanding his business and habits. He is frequently placed in a condition of uncertainty whether the chief part of his establishment may not be broken up. The hiring of strangers is the alternative presented to him. For illustrations of this first consequence to the employer, we beg to refer your lordship to the report of Mr. Hall.

On the other hand, the pauperized labourer finds that parochial relief is no longer eligible to him, except in case of absolute destitution. He finds that the discontinuance of the allowance severs the tie which bound him to his parish; and that at the same time the alteration of the law of settlement has diminished the probability of his being excluded as a foreigner from the disposal of his labour in the adjacent parishes, or in any part of the kingdom. But the distant employment is uncertain, and he finds it to his interest to make it worth the while of the employer to retain him in employment; not by offering his labour for reduced wages, but usually by offering to earn, by increased diligence, an increase of wages proportionate to the discontinued allowance. We refer your lordship, for illustrations of these effects, to the examinations of farmers and other employers

of labour, given in Mr. Gilbert's report, and also to the reports of Mr. Gulson, Mr. Hall, and Mr. Power. Some of the more liberal farmers have expressed, in their own way, their opinion of the change, by declaring that "it will make better masters as well as better men."

The connection of mutual interest between the employer and the labourer is thus restored and strengthened. The employer finds upon trial that the labourer considers him alone, and no longer the parish, as the superior employer. So soon as the labourer ceases to be dependent on the parish he labours more steadily and diligently, and this increased value of his labour enables his employer to use more labour profitably, and increase the return for it in wages. In all our more recent reports from the dispauperized parishes, it is stated that the wages are improved, and that the amount paid is greater than in the adjacent pauperized parishes. As an exemplification of the tenor of our information relating to the circumstances under which wages are affected by the change, we give the following portion of an examination of Mr. John Clark, a farmer of Bledlow, a parish in the Wycombe union, Bucks:—"If I have the free use on Saturday night of 5*l*. instead of paying it to the overseer, I shall be able to lay this out in labour on my land in the next week. Whilst the labourer was half pauper and half labourer, he was like a man with two masters, and could do justice to neither: but now he feels that he is only a labourer, he works hard and willingly. My 8*s*. wages will purchase for me labour sufficient to produce 10*s*. worth of crop; but with a pauper, my 5*s*. paid will be a loss; for all the labour such a man will do would not be worth half-a-crown. With independent labourers, the more I have in moderation the more I make; but for the paupers, the more I have the more I lose. I will employ as many of the former and as few of the latter as I can. Ten independent labourers would do me more good than five; whilst of paupers, five would be more desirable than ten."

When the indolence generated by the old system of parochial employment has been thus superseded by habits of industry, the train of vices generated by indolence are found to be gradually diminishing. The increase of sobriety is frequently denoted to us, in the progress of the change, by the complaints of the beer-shop keepers that the consumption of beer has diminished, and by their activity in opposing the progress of a further change. In the parish of Iwer, it was found that the change of system was marked by the almost immediate discontinuance of the poaching and pilfering, which had before that time prevailed to an unusual extent. Now that an external appearance of misery will no longer avail in the the dispauperized parishes as means of obtaining increased allowances, and that the bounties on filth and improvidence offered by the old system of out-door relief are removed, it is reported to us that an increased attention to cleanliness, neatness and comfort, is beginning to be observable in the cottages of the labourers.

A further moral result which is reported to us as being conspicuous in the dispauperized districts, is that the venal and improvident marriages, which were consequent upon the allowance system, have immediately been diminished.

We have reason to believe that the advantages of the change are becoming more extensively perceptible to the pauperized labourers. On the part of many of the smaller farmers, (excepting, too frequently, those who are tenants from year to year), who, as parish officers, commonly governed the fund applied in aid of

wages, an opinion appears to be advancing that their supposed immediate interests in making others contribute to the payment of their wages, and also in making a portion of their own payments quarterly as rates instead of weekly as wages, are now more than counterbalanced by the comparative worthlessness of the labour which they obtain, and the harassing contests and the vexations to which they are subject.

Considering how largely the return for any investments of capital in agricultural labour is dependent on the steadiness and general character of the labour applied, we are not surprised at the extent of the absorption of the apparent surplus of a pauperized parish in profitable employment, and we trust that we may anticipate the general diffusion of the advantages of the change amongst all who are connected with the agriculture of the dispauperized districts.

We are informed that many of those tradesmen who profited largely by the old system of parochial management have found that by the change of system their interests have not been injured to the extent which they anticipated, inasmuch as the purchases of the independent labourers have, to a considerable extent, made up for the diminished consumption of goods by the parish.

By one of the regulations of the new unions, it was provided that all goods for the use of the union should be purchased by contract, or open tender. From the following return from the Uckfield union, showing the difference in the amounts of the tenders when made for the whole union as compared with the supplies for the single parishes separately, an estimate may be made of the apparent amount of these interests affected by the change.

|                                 | Tender for a single Parish. |    | Tender for the whole Union. |    |

George Tatham, Esq., the chairman of the board of guardians of the Wycombe union, in the course of an examination as to the operation of that union, states, in answer to an inquiry as to the effects of making contracts for provisions in the union,

"I learn that all the little tradesmen are violent in their opposition to the contract. It is clear that

under the old system they had an advantage in the number of paupers which they have not now. The more money there was paid to the paupers, the more there was to be spent amongst the tradesmen, but the reverse is now the case. And under the old system paupers were often encouraged to get into debt, in order that an increased price may be charged upon the several articles they bought, and their custom insured for the future.

"Is there a saving effected to the union by the system of contract?—Decidedly there is. We give one-half in kind (subject of course to exception under particular circumstances). The price of bread by contract being 4d. for the loaf, and the charge of the little tradesmen being generally 6d., there is a saving of one-third upon the quantity we give in kind; that is a saving of one-sixth upon the whole relief. The average cost of relief of all the parishes before the union was about 30,000*l.* a-year; therefore, by this contract alone 5,000*l.* a-year will be saved,—a sum more than sufficient to pay all the expenses of management of the whole union for 11 years to come, and a reduction alone of one-sixth of all the rates upon every parish in the union."

We cite another instance of the further effects of the change, as stated in the evidence of an overseer of a parish in the same union:—

"Do you find any other result from the payment in kind?—Yes; I do find that the little tradesmen, who had formerly an interest in the increase of pauperism, now persuade the paupers to find work. Formerly, the more paupers, the more money the little tradesmen made; but now that a contractor supplies the bread, the less pauperism and the more independent labour, the more money to the shopkeeper. One of these shopkeepers called and remonstrated with me that all the men were not employed, and I know that he and others do all they can to prevent the men being paupers, and encourage their becoming independent labourers."

We trust that these advantages will be extended by an imitation of the example set by the guardians of the unions in East Kent, who have under their consideration the supply of the whole of the unions already formed in that county with one article, for the use of the several union workhouses, by means of a single contract.

Amongst the evils we found ourselves called upon to remedy, were a large class connected with the administration of medical relief. In our present report we deem it necessary only to advert to some of the chief evils of this class, and to the measures we have adopted with relation to them.

We found it a practice, in the great majority of instances, for a medical man to contract with the parish for the supply, to the settled paupers of the parish, of medical attendance for a small fixed sum, on the expressed or implied condition that he should be allowed to make whatever charges he pleased for his attendance and treatment of non-parishioners, under suspended orders of removal, or an order of medical relief by the overseer. When the patient has recovered, he is sent home to a parish with a bill for medical attendance, including charges for medicines at the highest rates. Against these charges the distant parish to which the pauper belonged had no adequate protection. The pauper was exposed to the danger of being supplied with medicines considerably beyond what was required for his proper treatment. Instances have come to our knowledge where in large populous parishes the profits of attendance upon paupers under such circumstances has been upwards of 300*l.* per annum. The inferior officers have been fed by the medical officer to

search out and give him information of the cases of this description. As a further evil of this system, we may mention that paupers with their families have been removed from their parishes at a great expense, when each head of a family would otherwise have preferred remaining and seeking employment in the parish where his sickness occurred. By countenancing these practices parishes were in the habit of creating burthens for each other. As a check to this system and to the general expense of medical relief, we have generally required that medical services should be retained by contract and open tender, including as a condition, that the medical officers should attend at the same charge all patients on the order of the overseer, whether the patients were parishioners or non-parishioners.

In regulating the appointments of medical officers within the new unions, we have acted on the presumption that by the words of the act (that the medical officer shall be "a person duly licensed to practise as a medical man"), it was intended to include equally physicians, surgeons, or apothecaries duly licensed to practice as such. Applications have been made to us to prescribe, as the qualification of the medical officer of any union, that he should be a member of the College of Surgeons as well as of the Apothecaries' Company; but as at present informed, we do not think that the public interests would be advanced by confining the qualification within narrower limits than those traced by the words of the act, and which conform to the general practice. With respect to the general professional qualifications of the medical men who come within the words of the act, we have relied on the diplomas of those who are charged by the legislature with the duty of examining the qualifications of the candidates for practice, being assured that the recent improvements in medical practice and education are such as in general to render the later diplomas certificates of a degree of competency, equivalent to much practice on the parts of those who have had an earlier education. Under these circumstances we have considered that the interests of the public and of the profession itself were the best served by keeping the situations of medical officers in the new unions open to the competition of the whole body of medical practitioners. Instead of attempting to fix the price of the services of the medical practitioners for the union, we deemed it the most advantageous that each practitioner should fix the price of his own services, under competition. Amongst the inducements to accept these appointments, are the credit of the appointment of medical officer to an union by a board of guardians, the wider fields these appointments offer for the display of care and skill, and for obtaining reputation leading to more profitable practice; inducements, differing in degree, but similar in kind to those upon which men of the most eminent skill find it to their interest to give their services to the chief medical institutions of the country. We may be sure that the medical practitioner will, in fixing upon his terms, do nothing which he considers will not on the whole be advantageous to himself; and next, that he will consider the interests and advantage of his own profession. We have found it necessary, as a security against undue charges even under competition, to adopt as a rule that the aggregate charges for medical relief within the new unions shall not exceed the aggregate of the former expenditure for medical relief in the separate parishes now included in the unions. Instances have occurred where the local medical practitioners have combined to prevent a competition. The course taken in these in-

stances for the protection of the rate-payers, and to secure the best treatment to the paupers, has been to suspend our sanction to the appointments, and to cause advertisements to be made to throw open the office to the competition of practitioners from a distance, or of the profession at large.

In some unions, as in the Wycombe union, it has been provided that the terms of the contract should be a remuneration at a given sum per head on the number who receive medical relief, but with the proviso that the gross charge should not exceed a given amount. It is stated to us in evidence that this mode of proceeding, though adopted reluctantly by the medical profession, has operated very beneficially. The surgeon of the Amersham union states, in the course of an examination,

"I approve of the system; but the amount in the present contract is inadequate; I think I shall lose a guinea a week by it. In some of the parishes it is at present only one-third of what I have received in former years for the same time. But I approve of the system, for these reasons: it is a self-acting check upon the relieving officer in giving improper orders or withholding proper orders; upon the applicant for medical relief, in making him feel that in receiving it he is a pauper, and causing the parish a specific charge for him; and upon the medical man, by causing an inquiry into each case, so that none can escape attention; and by that means also secures proper attendance to the patient. Indeed the mode of contract forms a complete system of check and security in cases of pauper medical relief, the want of which was so much felt under the old system.

"Has it tended to curtail the evil of sending all parties to the parish doctor for medical relief, which was so prevalent under the cases of contract in gross?—Yes, it has; I have many cases now that I am attending as independent patients who used always before to come to me as paupers. One case is that of a woman of Penn; her son is a master bricklayer, with whom she resides, the cottage and garden their own. She has a daughter about thirty, a sempstress, who gets a very good living. This woman was, with her daughter, always attended by the parish. On my telling this woman that the parish paid a specific sum for her, she refused to be attended, and now pays for herself. There are many cases which evidence this effect of the system.

"Of course, the new independent patients pay you?—Yes, they do; they pay us at the time they have the medicine.

"Now, although you do not receive so much from the parish contract, will not the amount by these new independent patients more than make up the difference?—No, I think not; but it will go towards it."

We anticipate that the introduction of a better system will be beneficial for the destitute sick as well as beneficial to the labouring classes generally; and that it will be found conducive to all proper interests of the respectable portion of the medical profession.

It will, however, be observed that the change in the system has not in many instances been so long in operation as to develop the whole of the effects which may be anticipated from it, in promoting voluntary and independent associations to provide for the casualties of sickness and mortality.

But even now the reports made to us of the very satisfactory effects of the operation of the rule are becoming daily apparent. We cite the following passage from a recent report made to us by our assistant-commissioner Mr. Hall, as illustrative of the

tenor of other incidental communications on the subject:

"The good effects of your arrangements as respects medical relief are showing themselves in the shape of medical clubs among the labourers. One of the surgeons of the Wallingford union told me that several were in process of formation in his district; and I have heard that elsewhere the labouring class has evinced the same degree of foresight and providence; has given the same proof that when thrown upon his own resources, and taught to rely upon his own exertions, the independent labourer can and will adopt measures answering to the necessity of the case."

Mr. Gulson states, in a recent report from Oxfordshire:

"Medical clubs are starting up in all directions. The proceedings of the Board as regards the medical department have already been productive of the best results. Highly respectable medical men are undertaking to attend all cases for an annual subscription of 2s. for a single person; and for 4s. 4d. they engage to attend a whole family, however large, so that it does not include children above 16 years of age. At Witney, Benson, and other places, the labourers are subscribing in considerable numbers to independent medical clubs."

Mr. Gilbert reports to us, that in several parts of Buckinghamshire the similar effects resulting directly from change of the medical relief, have been developed in a striking manner.

The increase of provident institutions, as arising from the general influence of the change of system, was confidently anticipated from the marked increase of deposits in the savings' banks, deposits by labourers who had previously been paupers, observed in several of the parishes which were the earliest dispauperized. The anticipation has been justified by the fact of the increase of the prosperity of the existing provident institutions, and by the increase of new institutions coincidently with the change of the law. Mr. Tidd Pratt, the barrister appointed to certify the rules of savings' banks and benefit societies, states to us "that the increase in the number of friendly societies since the passing of the Poor Law Amendment Act, has been very considerable as compared with the year previous thereto. From the month of August 1833 to August 1834, the number certified by me was 360; but from August 1834 to the present time, I have certified nearly 750, being an increase of 390, or more than double the number certified in the previous year. Independently of which, I am happy to say that these societies appear to be founded on calculations more likely to enable them to fulfil their engagements with the members than those which were heretofore in existence; and this I attribute in a great measure to the rules and tables which have been printed by order of the Lords of the Treasury, and gratuitously distributed.

"With respect to depositors in savings' banks, the increase during the last year has been very considerable. The accounts are made up annually to the 20th November; and although from November 1831 to November 1833, (being a period of two years), the number of depositors increased during that period 44,750, yet from November 1833 to November 1834, the increase in the number of depositors has been nearly 33,000, and in the money deposited, nearly a million: and in each of the following counties, viz. Bedfordshire, Berkshire, Bucks, Cambridgeshire, Essex, Hertfordshire, Kent, Norfolk, and Sussex, a marked increase has taken place in the number of the small depositors."

It is stated to us, that the effect of the general practice of sending to the workhouse for 21 days paupers who require to be removed, has been greatly to diminish the number of cases of removal. The general testimony as to the operation of the provision requiring that previously to any removal being made, the grounds upon which the order is granted should be stated to the parish to which the pauper is removed, has been, that it has to a considerable extent diminished the amount of litigation, and we are informed that in some districts it has nearly extinguished that branch of business at the sessions.

From the reports of our assistant-commissioners, as well as from the communications made to us from all parts of the country, we can state that the testimony as to the operation of the clauses of the Act which relate to cases of bastardy strongly preponderates in favour of the principles adopted on that subject by the legislature. For some time after the passing of the act a popular impression appeared to be extensively prevalent that the law had been changed in the mode proposed by the late commissioners of inquiry, and that the mother of a bastard child requiring relief was placed in the same condition as if no father of the child was in existence, but that she was entitled, nevertheless, to relief as for herself, in case of her inability from destitution to maintain the child. The evidence as to the effect of this impression leads us to believe that the enactment itself would have produced all the beneficial effects wished and intended by the promoters of the measure. The operation of the modified clauses of the act as they now stand is reported to us to be proportionately beneficial.

The following extracts from the report of Mr. Gulson, display the general tenor of the incidental information which we receive on this subject:

"The assistant-overseer of St. Giles', Oxford, is sure that there are not so many unmarried women pregnant in the parish now, as was usual heretofore. He knows no other cause for this but the 'fear of the new law,' which makes the girls cautious."

"Mr. Clarke, master of the union workhouse, Oxford, states that previously to the passing of the Poor Law Amendment Act, the average number of the orders of affiliation made in the united parishes annually was fourteen, and there were usually eight or nine cases on the book for relief, without an order. Up to the present date, August 5, there have been three orders made, and five cases are relieved without order."

"Andrew Richardson, assistant-overseer of St. Clement's, Oxford, feels certain that there are not now so many unmarried women pregnant in that parish as has been usual hitherto. He constantly hears the females of the lower order complaining of the new law, and proving that they understand its intention."

"The assistant-overseer of St. Mary's, Reading, says he is certain the new law has had considerable effect in that town in stopping the progress of bastardy. Fewer cases of pregnant single women have come under his notice than at any former period."

Information is constantly brought to us, that in the more populous parishes the number of new cases of claims for relief on account of bastardy are greatly diminishing; whilst from the rural districts we receive similar testimony, accompanied by statements showing that as incontinency is a less certain passport to marriage, and the virtuous females of the labouring classes are no longer placed at the same disadvantage as they were previously to the passing of the law, the improvement of morality amongst this class of females is daily becoming more perceptible.

The following is an instance of the testimony as to the operation of the act, given in a letter from the overseer of Llanasa, in the county of Flint, in answer to an inquiry from the board, "Why the bastards in the parish are now so few?"

I can only observe, that in the first place, we never force the putative father to marry the mother, and we compel the mother as well as the father to pay her quota towards the maintenance of the child. This was our simple mode of treating the business.

"One thing I must observe, and it tells well for the new Poor Law Act: that in our parish we have from fifteen to twenty weddings in the year, and it seldom happened that, at the ceremony the bride did not think it decent and requisite—I am now speaking of the lower order of persons—to conceal her shape under a cloak. But in the eighteen marriages which we have had since last August, all the ladies, except one, retained their virgin shape, and appeared without their mantle."

In several of the more populous parishes the reduction of the cases of bastardy has been to the extent of one order made now, where ten were made before the passing of the act.

Serious objections, however, to which we feel it our duty to advert, have been made to the operation of this part of the act.

It is to be presumed, that in sending the cases of bastardy from the petty to the quarter sessions, it was foreseen that the proceedings against the putative father would be expensive, and that they were intended to be so; that, in giving full costs to the person charged, and none against him; in requiring evidence corroborative of the testimony of the mother; in providing that fourteen days notice of proceedings should be given to the putative father, who might, during that time, abscond; and in exempting the putative father from imprisonment, and confining the security for the repayment of the charges to the attachment of wages or goods, where he has any; it was foreseen that the process would be uncertain as well as expensive, and was intended that it should be so, in order to discourage as much as possible proceedings against the putative father, which could not otherwise be divested of the evils inherent to any such proceedings on the part of the parish.

It has been made matter of extensive complaint to us, that the remedy is expensive and uncertain. In numerous communications made to us by parish officers, they have declared, in complaining of the process, that as they were convinced the parish could only lose by it, they intended to abandon the pursuit of the father. Since the passing of the act, a considerable number of cases have been brought before the quarter sessions; but we have not been able to ascertain, in time for insertion in this report, the progress of these cases, or the extent of the indications that the presumed intentions of the legislature will be accomplished, and the remedy against the father fall into desuetude.

In the statement transmitted to us by your lordship, with a request that we would report upon it, with a view to determining upon the propriety of calling upon the legislature to interfere, a serious complaint was made against the provisions of the act as they now stand, on the ground of the disgusting nature of the details of the cases developed before crowded courts of the quarter sessions, in consequence of that court being now the only tribunal of appeal. If this objection were urged with a view to the return to the provisions of the old law, in respect of the proof required, we should submit that, in considering the admitted evil of such an investigation, the evil must not be overlooked which was formerly so prevalent,

of the perjury committed when the oath of the mother was conclusive evidence of the fact of paternity.

But whilst stating our impressions, as derived from the evidence presented to us, of the great improvement which the provisions of the existing act have produced, we must state our apprehensions that they are in some respect open to objection, as not being entirely divested of the evils of the old law, in offering a means (though much diminished) of intimidation, by the threat of lengthened proceedings if compliance be not made. The process, we are apprehensive, is still in some degree available against the putative father who may have goods or wages liable to attachment.

As unions are extensively formed, and the administration of relief is gradually placed in the hands of paid and responsible officers; as the ignorance which prevails upon this subject is dispelled by the evidence which daily arises of the beneficial effects of the alteration of the old system, we consider it highly probable that the number of cases brought to the sessions will be diminished. But the pursuit of the father is still considered a matter of duty by the parish officers, and there are so many interests in support of the continual practice, (amongst which must be noticed the interests in encouraging litigation,) that we must expect that it will to a considerable extent be continued. As an illustration of the force of habit, we may mention that, although the law requires that the order upon the father should be made with relation to the actual cost of the necessities for the maintenance of the child, we find that the magistrates at various quarter sessions still continue the practice of making the order, not with reference to the proper actual cost, which varies little, but with reference to the condition of the father; thus giving bounties for the maintenance of the abuses of the old system.

Whenever it shall be deemed requisite that application be made to the legislature on this subject, we should venture to submit that the most effectual course of abating the remaining evils would be by an entire repeal of the statutory provisions under which proceedings can be taken by the parish against the putative father.

We would observe that, by the existing law, the whole of the money recovered from the father must be given to the parish, and the mother is entitled to no part of it. She cannot, therefore, by the proposed repeal, become a loser of anything but the power of causing the putative father to be proceeded against by the parish. It is acknowledged that, considered with reference to a class of cases, the remedy is of no value as a means of obtaining indemnification to the parish. The ground most strongly urged for the process against the father, is founded on the notion that it may serve as a means of punishing the seducer. We participate in the feelings of detestation of the crime of seduction; but the principle, that poor law administration should be the administration of relief alone, cannot be departed from by the introduction of anything having a view to punishment, without at the same time creating far greater evils than those which it is intended to repress. Neither can any existing authority for the dispensation of relief be safely considered as properly constituted as a judicatory for the award of private satisfaction for wrongs, or for the infliction of punishment. It appears to be commonly overlooked in the complaints on this subject, that for the injury of seduction the courts of law afford a remedy; and to any objection which might be made that this remedy is too costly, or is otherwise out of the reach of the poor, we submit that the proper re-

medial course of legislation would be to render justice, dispensed by proper judicial functionaries, accessible to the poorest classes of the community.

The evidence of the benefits now daily becoming manifest from the approximation to a sound principle in the administration of relief in this class of cases, has not been accompanied by any countervailing statements of evils or injuries traceable as consequences of the alteration of the law. Cases of hardship might have been expected to occur; cases of the desertion of children and of infanticide always formed a large class of cases in the returns of the statistics of crime during the existence of the old law; but we have seen no evidence of the increase of such cases subsequently to the passing of the Poor Law Amendment Act, nor amidst all the complaints unreservedly made to us, with claims for our aid to provide remedies for any real or supposed evil or inconvenience, have we received any authenticated cases of hardship. Some alleged cases of this description have been displayed before the public, but on investigation, in every instance which came to our knowledge, they were found to be fraudulent.

Amongst the preparatory regulations prescribed to the boards of guardians, was one ordering the discontinuance of relief to all able-bodied paupers between the ages of 16 and 60, who are not resident within their own parishes.

The reasons for the early adoption of this rule were, that, whilst the paupers remain in distant parishes, the grounds on which they found their claim to continued relief, are generally out of the reach of adequate investigation, and of the constant revision which is necessary to stem the influx of fraudulent claims. In such cases, moreover, there always appears to be some weighty advantage to the pauper, either in the constancy of employment, or the local aid of relatives or friends, which constitutes the motive for non-residence.

A further inducement to the application of the rule to these cases, was created by the circumstance that the change would not affect considerable numbers living together, but would come into operation with separate individuals, with relation to whom separate arrangements might commonly be made.

The operation of this rule has fully justified our anticipations. In the cases where it has been carried into effect, the instances are extremely rare of a non-resident parishioner returning from any distant parish in consequence of the discontinuance of relief. By some employers of labour, indeed, the continuance of this mode of relief has been defended as an out-post of the allowance system, as it was perceived that if in these instances it was proved that the allowance might be safely discontinued, the success of the discontinuance would afford a strong presumption of the practicability of the immediate discontinuance of the out-door allowance in aid of wages to the resident able-bodied paupers. The rule has been promptly acquiesced in, in all parts except Sussex.

Urgent applications have been made to us from some parts of that county for the relaxation of the rule, and the applications have been supported by statements of the strong claims of the non-resident paupers, and of the hardships which would be inflicted upon them by the change. These statements have, on examination, been found to be greatly exaggerated. We, therefore, refused to relax the rule, and the hardships and inconveniences so confidently anticipated have not occurred.

The first operation of the rules and orders for the administration of relief in the new unions was met

in several unions by riotous proceedings on the part of bodies of paupers.

An opinion of the character of these riots, and of the state of the paupers in the districts where the riots occurred, may be formed from the fact, that in nearly the whole of the cases the riots were occasioned by the rule which requires that one half of the relief should be in bread or other necessities.

Money is applied for as a means of obtaining bread. Bread the families require as a primary article of necessity. The supplies of bread given in the new unions were always as good as those attainable from the shopkeepers, and were frequently declared to be much better. There could not, therefore, be any reasonable pretext for objection on the part of the paupers, even on the ground of inconvenience, if inconvenience were admissible as a ground of objection.

It is to be observed, that the introduction of these changes, and especially of the regulations for the substitution of relief in kind for relief in money, were preceded by complaints, not from the labourers whom alone the change alone could legitimately effect, but from the shopkeepers and others engaged in furnishing supplies of goods for the use of parishes. As instances of the character of the complaints which have come to our knowledge, we refer to the memorials from certain rate-payers in the town and parish of Sittingbourne, and also to the memorials of the parishes of Doddington and Newnham in the county of Kent, and from the town and parish of Potton in Bedfordshire. We have not the slightest reason to suppose that these particular memorialists were concerned in any of the breaches of the peace which subsequently occurred. We cite the documents as authentic expositions of the feelings prevalent amongst the classes who consider their interests affected by the change. In the course of the subsequent inquiries into the causes of these disturbances, the connexion with them of persons of these classes has been manifest, although it is difficult to establish the fact by technical proof. In most instances, the means of incitement have been violent expressions of hostility to the measure, denunciations of its principles, always incorrectly stated, and expressions, couched in the form of predictions, suggesting the probable occurrence of riotous proceedings, and how the acts of violence might or would happen.

In East Kent the riots were promptly suppressed by the civil authorities, with the aid of two sergeants of police, and the presence of a party of military. Some disturbances were threatened at Eastbourne, but were prevented by the energy and vigilance of the magistrates. A riot occurred in the Amptill union, but was quelled by the active aid of a party of 20 of the metropolitan police, the yeomanry being ready to act, if required. One riot which occurred at Chesham, Bucks, was suppressed by the energy of the local authorities, who were afterwards aided in apprehending some of the ringleaders, and in maintaining the peace, by a body of the same number of the metropolitan police and a party of yeomanry. In a few other instances the relieving officers have been assaulted in the execution of their duty.

When we recollect the extent of erroneous impressions respecting the principles and provisions of the Act which have prevailed, even amongst the educated and better-informed classes, and the persevering misrepresentations with which the public mind has to the last been assailed on this subject, we cannot but consider that the obstructions which have been attempted to be created on the part of the

labouring classes are, on the whole, much less than might have been expected.

We have great satisfaction in being able to state, that we have received information that a considerable portion of the labouring classes in some of the agricultural districts are not adverse to the change. We have learned that a few weeks since several persons in the character of delegates from some trades' unions in the manufacturing districts, went amongst the agricultural labourers of Sussex, using violent language, and representing to them that the Act was intended to depress their condition, urged them to join the other unions, and take measures for resisting the law. In consequence of these proceedings, conferences were held amongst the agricultural labourers, who ultimately declined connecting themselves in any way with the alleged delegates, and stated "that although they were apprehensive that they should have to endure much suffering in making the change, yet that they were satisfied it would be the best for them at last to be freed from the parish."

Mr. Pilkington also states, with reference to another district of the same county, that "at the time of the formation of the Thakeham union, which is situated in one of the worst regulated parts of West Sussex, the greatest efforts were made by interested persons to get up disturbances, without effect. A gentleman resident in a parish in Sussex, who was a great sufferer in the riots of 1830, stated to me that the same men, four of whom he knew and had marked, who were the ringleaders in the disturbances of that time, had again been attempting to excite the labourers to acts of insubordination, but without effect. They even," the gentleman further stated, "passed through his parish, well known as one of the worst parishes in the union, with a few deluded persons whom they had collected together, and actually hissed the labourers as cowards and slaves because they would not join them. In the Rogate and Harting districts, well known as amongst the most pauperized in Sussex, delegates from the Eastbourne rioters have been doing their utmost to excite the labourers to acts of violence, but hitherto, except in the instance of a few women and children, without effect."

The persons engaged in the riots have been generally found to be the worst characters within the district, and commonly distinguishable from the general body of the labouring population by their conduct.

We feel bound to bear testimony to the excellent conduct and discipline of the metropolitan police, on every occasion where their services have been required for the suppression of the riots to which we have adverted. Having no local interest or connexions, their intervention excited the least possible degree of hostility. They invariably acted with perfect coolness, and under the best discipline, and left impressions highly favourable to them.

Before we close our report, we feel it our duty to represent to your lordship that from the magistrates of the several counties with which we have hitherto been chiefly engaged we have received highly valuable assistance in carrying the act into operation. As *ex-officio* guardians, they have attended sedulously to their new and highly important duties, and have given cordial and efficient assistance in carrying the act into execution. As conservators of the peace, they have in every instance where resistance has been attempted enforced the law with vigour, and brought the offenders to justice.

Out of the 2,000 parishes united we have had a very small number of instances of parishes omitting to make due elections of guardians. In most of these

cases the parish officers, who had incurred the suspicion of negligence or contumacy, anticipated any proceedings against them, by pleading ignorance, and requesting to be permitted, under a new order of election, to supply the omission; and the permission has generally been granted. These irregularities could not have interrupted the proceedings for the execution of the act.

At the boards of guardians there has been a constant attendance of the members, who have generally been exceedingly laborious in the performance of their duties. In many of the new unions, the guardians, after having travelled several miles to the place of meeting, have frequently been engaged from ten or eleven in the morning until eight or nine in the evening, in the performance of their gratuitous services. As the business of the unions becomes more systematized, and further advances are made in the execution of the act, we trust that less frequent attendances and less severe exertions will be found necessary; and as the paid officers are tried and found competent, a greater proportion of the labour and responsibility of the executive duties may devolve upon them, and the guardians be relieved from the labour of the performance of more severe duties than those of superintendence and control.

From many of the magistrates and members of the boards of guardians we have received valuable communications.

It also gives us great pleasure to be enabled to state, that by a considerable number of overseers and parish officers great exertions have been made to carry into execution whatever regulations we have suggested. In cases where formal orders might have been required, they have acted promptly upon our recommendations. To this circumstance the extensive substitution of relief in kind for relief in money, which has taken place in conformity to our circular of the 8th of November, is to be attributed.

We see nothing in the present situation of the unvisited counties which will be likely to induce us to deviate materially from the course of proceeding we have hitherto adopted. The system which it has been found advantageous to apply to the best managed parishes included in the new unions, will, for similar reasons, and under certain modifications, be found equally advantageous in its application to the least burthened of the counties that are yet unvisited. We shall from time to time revise our past orders and arrangements, with a view to a closer, and ultimately to a complete adoption of the workhouse system, and the extinction of all out-door relief to the able-bodied.

We cannot, under the varied circumstances of the different districts, and the certainty that in many of the new unions a considerable expenditure of the time of our Assistant-Commissioners will be required in superintending their initiatory proceedings, form an accurate estimate of the future rate of progress in our labours; but we trust that with the advantages of increased experience and improved arrangements, together with the aid derivable in each district from an increasing perception on the part of the inhabitants, of the real character of the measure, we shall be enabled to proceed in the formation of unions at least as rapidly as hitherto.

We have prepared for the new unions, and the parishes comprehended within them, one uniform system of accounts, with instructions for keeping and auditing them. We propose also to prescribe a general form of accounts for the ununited parishes, together with such general rules for the administration of re-

lief within them, as have on trial proved successful, or as may prove applicable, until the time shall arrive for including each parish in a union.

In concluding this our First Annual Report, we beg to assure your Lordship that our labours are sustained by an entire conviction that the act in every main provision will fulfil the beneficent intentions of the legislature, and will conduce to elevate the moral and social condition of the labouring classes, and promote the welfare of all.

We have the honour to be, my Lord,

Your Lordship's most obedient Servants,

T. FRANKLAND LEWIS.

(L.S.)

JOHN GEORGE SHAW FEFEVRE.

GEORGE NICHOLLS.

## DORSETSHIRE.

FROM KENNEDY'S AND GRAINGER'S PRACTICE OF  
TENANCY IN THE GRAZING DISTRICTS OF GREAT  
BRITAIN.

The whitest fleeces here, are those which are produced upon the Downs, where the land is not heavy, nor are the sheep liable to have the drifted soil mixed with the wool: where they are exposed to elevated situations, and reduced to harder feeding, the wool becomes harsh: the finest wool in this county, is that which grows the fastest upon rich pastures, that is to say, not a rank or marshy soil, but good pasture land. It has been remarked here, as well as in other districts, that the first growth of the wool, after shearing, feels harsh to the touch, which is considered to be, as it were, a natural consequence of what is generally the case, exposure to the weather, very soon after that operation has been performed.

With regard to smearing or covering the sheep with any unguent, it is thought here, that if any oily preparation were mixed with the wool, it would render the cleansing of it very difficult, especially as it would serve, as it were, as a harbour for dirt, and that the expense, in that case, would not be repaid by means of any increase or superiority of wool; neither is it thought that any advantage would be derived to the wool by a slight greasing after clipping, though it might be beneficial to the sheep. The maxim acted upon here, is, that good food makes good wool; and that the better the feed, the better and more healthy become both the carcase and the wool. It is admitted, however, that in order to cure cutaneous diseases and those arising from the effects of the fly, it is necessary to have recourse to unguents soon after clipping; but whilst the full fleece is on the back of the animal, it is thought that clearing away the wool from the parts affected, is sufficient to prevent the further spread of disease. It is, nevertheless, not denied, that sheep smeared with unctuous preparations, throw off snow and rain sooner than those which are ungreaed; but sheltering them in unfavourable weather is thought to be a better practice, an equal temperature and a regular supply of good food being considered the most likely means to secure a good fleece.

With respect to the washing of sheep, that operation is performed in this county either in a running stream, or in water fetched for the purpose, and the wool is considered to be much benefited and rendered more saleable by it.

It is not believed here, that the housing or coting of sheep would be beneficial, but, on the contrary, that the confinement would be injurious; but, it is

acknowledged, as just before mentioned, that shelter would be highly advantageous, and be productive of a saving of expense, as the sheep would be less liable to disease.

The opinion entertained in Dorsetshire is, that the removal of sheep to a luxuriant pasture does not tend to render the wool coarser, but, on the contrary, that such a pasture produces the best wool. This, however, must be understood, with the limitation before specified, namely, that such pastures are really good ones, and not rank. The change from a poorer soil to a richer pasture, is supposed to have an effect upon some breeds more rapidly than others; but the opinion entertained by the farmers here, is, that the most healthy sheep feel and display the influence of such a change the soonest, without much regard to breed: neither are they favorably disposed towards the Merinos, which they consider to be very tender, requiring a fine climate to fatten, being worth nothing (as to carcass) when they are fat, and that their wool, the only valuable part of them, does not repay the expense of growing it.

Another opinion entertained here, is, that the fleece is not increased in bulk after a mild winter, and that dry cold does not injure sheep, but that it is rain and sleet which deteriorate the animal and check the growth of the wool, and that the short and sound food produced in dry weather, is more nutritive for the sheep than all the washy produce (though more abundant in quantity) of a mild and wet season. It is, however, admitted, as an indisputable fact, that a deficiency of food is very injurious to the growth of wool. Shelter in bad weather, or when very hot, being considered very advantageous, it is thought that open sheds would be highly desirable on sheep farms.\*

The greater proportion of the sheep farms in this county, consist of arable land. The having winter or summer pasture depends upon the various circumstances of the respective farms. Where the sheep are put out to keep during the winter, an agreement is in some cases made for a certain rent per acre, and in others for a specified charge per head during a given time. The flocks also, according to circumstances, are sometimes divided and classed, but frequently allowed to run altogether. They consist of both ewe and wedder flocks. The ewes have their first lamb at about two years of age, when they are called two toots.

It is believed here, that the wool produced in this county may undoubtedly be rendered of finer quality, by means of the introduction of superior breeds: this improvement has, as already stated, commenced, and is making a rapid progress, the wool having evidently greatly improved, in consequence of this change of system.

**SETTLEMENT LAW.**—A material alteration has been made herein, by the late poor law amendment act. As the law formerly stood, the settlement of a second husband was not communicated to the family of the wife by a former husband; but under the 57th section of the new act it is otherwise, during the continuance of the marriage—as will appear by the following communication from

the poor law commissioners, which has been received by our neighbouring magistrates:—

“Poor Law Commission Office, Somerset House,  
18th August, 1835.

“Gentlemen,—The Poor Law Commissioners for England and Wales have to acknowledge the receipt of your letter of the 22nd ult.

“In reply, the Commissioners desire to state to you their opinions that the settlement of the second husband is communicated, during the continuance of the marriage, to the family of the first, until one of the contingencies pointed out by the 57th section of the Poor Law Amendment Act occurs, viz,—‘until such child or children shall respectively attain the age of sixteen, or until the death of the mother of such child or children.’

“In either of these cases occurring, it is the opinion of the Commissioners that such children revert to their former, that is, their father's settlement, which has been suspended whilst they formed a part of the second husband's family.

(Signed) “By order of the Board,  
“E. CHADWICK, Secretary.”

“Addressed to the Magistrates clerks of the  
Division of Chewton.”

We give publicity to the above, as it is important that the Board's instruction on this section of the act should be known by all magistrates and parish officers.

**THE MOVING PLANT.**—The following interesting notice of the Moving Plant appears in No. 122 of Maund's Botanic Garden, a work replete with information on such subjects:—“This plant was formerly called *Hedysarum gyrans*; and the peculiar property of continual motion which its ternate leaves possess, has interested naturalists ever since it was noticed by the younger Linnæus. In a letter to his friend Mutis, he says, ‘I have raised a very wonderful plant this year in my garden. It is a new species of *Hedysarum* from Bengal. This plant has a spontaneous motion in its foliage, which seems almost voluntary. You are aware that various parts of the vegetable body, especially those subservient to impregnation, can be so stimulated by the touch as to exhibit some kind of movement. You know also the motions of some kinds of *Mimosa* and *Oxalis*, as well as of the *Dionææ muscipula*, arising from the touch of any extraneous body, or from the agitation of the wind. But the plant in question is not affected by either of these causes. Whether in the open air or in a close room, it spontaneously moves its leaflets, now one way, now another, one, two, or more at a time; not all at once, nor all in one direction; and this takes place whether the air be serene, cloudy, or rainy. It has not yet flowered, but I expect that event in the course of the autumn. The plant requires great heat.’ Instances of incomprehensible action like this can but awaken the attention of the most apathetic. The irritability of some plants is better known, especially that of *mimosa pudica*, or humble plant, whose leaves shrink from the touch, the culture of which may be recommended to the curious among our young friends. Seeds are easily obtained, and an efficient hot-bed during summer, in which the plants should be constantly kept, will sufficiently mature them for the purpose of showing their sensitive peculiarities. This is a property which advances the vegetable towards the animal kingdom, just as instinct advances the brute towards the human species.”

\* We should therefore propose sheds formed in the shape of a cross, open on one side and closed on the other, that shelter might be found by the sheep from whatever quarter the storm or wind might blow, or from the too great heat of the sun.

## AN ACT FOR THE MORE EASY RECOVERY OF TITHES.

[PASSED 9TH SEPTEMBER 1835.]

Whereas an act was passed in the seventh and eighth years of the reign of King William the Third, [7 & 8 W. 3 c. 6.] intituled *An act for the more easy recovery of small tithes*, whereby it was amongst other things enacted, that two or more of his Majesty's justices of the peace were authorized and required to hear and determine complaints touching small tithes, oblations, and compositions substracted or withheld, not exceeding forty shillings: and whereas an act was passed in the fifty-third year of the reign of his late Majesty King George the Third, [53 G. 3. c. 127.] intituled *An act for the better regulation of ecclesiastical courts in England, and for the more easy recovery of church rates and tithes*, whereby the jurisdiction of the said justices was extended to all tithes, oblations, and compositions substracted or withheld, where the same should not exceed ten pounds in amount from any one person: and whereas by an act of the seventh and eighth years of the reign of King William the Third, chapter thirty-four, provision is made for the recovery of great and small tithes (not exceeding the amount of ten pounds) due from Quakers, by distress and sale, under the warrant of two justices: and whereas by an act of the first year of the reign of King George the First, chapter six, the provisions of the said last-mentioned act were extended, in the case of quakers, to all tithes or rates, and customary rights, dues, and payments belonging to any church or chapel: and whereas by the said recited act of the fifty-third year of the reign of King George the Third the aforesaid provisions in relation to quakers were amended, and were also made applicable to any amount not exceeding fifty pounds: And whereas by an act of the parliament of Ireland of the seventh year of the reign of King George the Third, chapter twenty-one, amended and extended by an act of the parliament of the United Kingdom of the fifty-fourth year of the reign of King George the Third, chapter sixty-eight, similar provisions are in force in Ireland for the recovery from Quakers, of great and small tithes, and customary and other rights, dues and payments belonging to any church or chapel, not exceeding the amount of fifty pounds: And whereas it is highly expedient and would further tend to prevent litigation, if, in the cases and with the exceptions hereinafter mentioned, all claimants were restricted to the respective remedies provided by the said recited acts: Be it therefore enacted by the King's most excellent Majesty, by and with the advice and consent of the Lords spiritual and temporal, and Commons in this present parliament assembled, and by the authority of the same, that from and after the passing of this act no suit or other proceeding shall be had or instituted in any of his Majesty's courts in England now having cognizance of such matter for or in respect of any tithes oblations, or compositions, withheld, of or under the yearly value of ten pounds (save and except in the cases provided for in the two first-recited acts,) but that all complaints touching the same shall, except in the case of Quakers, be heard and determined only under the powers and provisions contained in the said two first-recited acts of parliament in such and the same manner as if the same were herein set forth and re-enacted; and that no suit or other proceeding shall be had or instituted in any of his Majesty's courts either in England or Ireland now having cognizance of such matter, for or in respect of any great or small tithes, modulus, com-

positions, rates, or other ecclesiastical dues or demands whatsoever, of or under the value of fifty pounds, withheld by any Quaker either in England or Ireland: but that all complaints touching the same if in England, shall be heard and determined only under the powers and provisions contained in the said recited acts of the seventh and eighth years of King William the Third, chapter thirty-four, and the fifty-third year of King George the Third; and if in Ireland under the said recited act of the parliament of Ireland, of the seventh year of King George the Third, and the said recited act of the fifty-fourth year of King George the Third, in the same manner as if the same were herein set forth and re-enacted: Provided always, that nothing herein before contained shall extend to any case in which the actual title to any tithe, oblation, composition, modulus, due or demand, or the rate of such composition or modulus, or the actual liability or exemption of the property to or from any such tithe, oblation, composition, modulus, due or demand shall be *bona fide* in question, nor to any case in which any suit or other proceeding shall have been actually instituted before the passing of this act.

II. And be it enacted, that in case any suit or other proceeding has been prosecuted or commenced or shall hereafter be prosecuted or commenced, in any of his Majesty's courts in England or Ireland, for recovering any great or small tithes, modulus, or composition for tithes rate, or other ecclesiastical demand, substracted, unpaid, or withheld by or due from any Quaker, no execution or decree or order shall issue or be made against the person or persons of the defendant or defendants, but the plaintiff or plaintiffs shall and may have his execution or decree against the goods or other property of the defendant or defendants; and in case any person now is detained in custody in England or Ireland under any execution or decree in such suit or proceeding, the Sheriff or other officer having such person in his custody shall forthwith discharge him therefrom; and the plaintiff or plaintiffs in such suit or proceeding shall and may, notwithstanding such discharge, issue any other execution or take any other proceeding for recovering his demand and his costs out of the property, real or personal, of the person so discharged.

## AN ACT FOR THE AMENDMENT OF THE LAW AS TO THE TITHING OF TURNIPS IN CERTAIN CASES.

[PASSED 9TH SEPTEMBER 1835.]

Whereas it is frequently convenient and necessary in the agistment of turnips by sheep or cattle, to sever the turnips from the ground, in order that they may be the more easily and completely consumed, and thereby to prevent waste, and it is not reasonable that such severance should vary or affect the payment of tithe: Be it therefore enacted by the King's most excellent Majesty, by and with the advice and consent of the Lords spiritual and temporal, and Commons, in this present parliament assembled, and by the authority of the same, that from and after the passing of this act, in all cases where turnips shall be severed in the manner aforesaid, and shall be eaten on the ground by sheep or cattle, and not otherwise removed, the same shall be subject to the payment of tithe in the same manner and to the same extent as if they had been eaten by such sheep or cattle without having been so severed as aforesaid, and no farther or otherwise.

## MALT LIQUOR.

Mr. Editor.—Being well aware that the interest of the great bulk of society is ever predominant in the conduct of your valuable journal, I send you the following brief sketch of a lecture on malt liquors, delivered in London, on Thursday last, by Mr. Livesey, of Preston; by giving publicity to which you will confer the greatest benefit on society.

The lecturer commenced by stating that a great delusion existed with regard to the nutritious quality of ale, in a gallon of which he proved to demonstration there is only a simple pennyworth of nutriment, and that not equal in quality to wheaten bread. The following is his argument:—

|                                   |          |
|-----------------------------------|----------|
| Cost of a gallon of ale - - - - - | 2s. 0d.  |
| For barley - - - - -              | 0s. 5d.  |
| To the maltster - - - - -         | 0s. 1½d. |
| To Government - - - - -           | 0s. 3¾d. |
| To the brewer - - - - -           | 0s. 8d.  |
| To the retailer - - - - -         | 0s. 6d.  |
|                                   | 2s. 0d.  |

Having stated this, Mr. Livesey thus proceeded—“From this you perceive, that ale is five times the price of the barley,—which is the only nourishment in it. The price given for hops is fully met by the sale of the table beer. The man who would pay 2s 6d for a pound of beef instead of 6d is a parallel case. But further it is to be considered, that the nutritious parts are reduced one quarter in malting, one-third in brewing, which as grains become food for cattle; and at least one-third in fermentation; so that when you drink the ale, you have not more than 1d worth of barley.

If any doubt this, let them convince themselves by boiling a quart of ale, and the solid matter remaining after the evaporation of the spirit and the water will be about two ounces, or eight ounces to a gallon, the weight of a penny loaf.

|                                                   |         |
|---------------------------------------------------|---------|
| 30lb. of barley - - - - -                         | 2s. 0d. |
| 1 gal. of ale, containing 1½lb. of barley 2s. 0d. |         |
| Buying this amount of ale is equal to giving      | lb.     |
| To the maltster - - - - -                         | 1½      |
| To the Government - - - - -                       | 4¾      |
| To the brewer - - - - -                           | 10      |
| To the retailer - - - - -                         | 7½      |
| Allowing for loss in malting - - - - -            | 1½      |
| Ditto in brewing - - - - -                        | 2       |
| Ditto in fermenting and keeping - - - - -         | 1½      |
| Reserving for myself, as the fool's portion       | 1½      |

30

I beg leave to remain, Sir, your most obedient servant,  
AN OBSERVER.

PAPER MADE FROM TURF.—A cheap and yet good substitute for hemp-rags, for the purpose of affording a pulp fit for paper-making has long been a desideratum with the manufacturer. Many attempts have been made to procure one, but the difficulties of finding one such as would suit the required condition, and the duty and cost of hemp-rags, have induced adulteration to a vast extent in the paper-manufacture. It is generally known that a peat-bog, and especially those of Ireland, consists of various strata, varying in density and other properties in proportion to their depth. The top surface of the bog is usually covered with living plants, chiefly mosses, heaths, and certain aquatic or paludose plants; immediately beneath this lies a stratum, varying from only two or three inches to four or five feet, according to the state of drainage of the bog, of a spongy, reddish brown, fibrous substance, consisting of the remains of vegetables similar usually to those living on its surface in the first stage of decomposition. The chemical state of this stratum is nearly that of some of the papyri found in moist

places in Herculeaneum; that is to say, having long been exposed to the action of water, at nearly a mean temperature, the vegetable juices have nearly all been converted into ulmin-geine, or impure extractive matter, and the fibres remain nearly untouched, together, probably, with some of the essential oils of the original plants. It, therefore, seemed that if these fibres, which were apparently sufficiently fine for the purpose, could be separated from their colouring matters, that the object would be nearly, if not entirely, attained; to this, therefore, attention was directed, and it was attended with success. We examined specimens of the pulp, described as being yielded from peat, at the rate of 18 per cent, and have no hesitation in saying, that it appeared to be white, pure, and perfectly suited to the manufacture of paper. We should like to print a *Literary Gazette* upon it, after it had undergone the needful concoction from Mr. Dickinson's beautiful mills. Ireland, we believe, is blessed with two millions of acres of bog (of which 1,300,000 are susceptible of drainage and cultivation); and if it should be convertible into so many useful articles of consumption, how prodigious must be the sources of employment and improvement which it will open to the view of the Statesman and philanthropist.—From the *Literary Gazette Report of the Proceedings of the British Association at Dublin.*

EXTRACT FROM A PRIVATE LETTER, DATED KINGSTON, CANADA, AUG. 13.—The weather, although exceedingly hot, has been favourable for getting in the harvest, and the crops, I am happy to say are, in general, abundant. The increased demand from the American market, and the failure in your province is likely to keep up the price of wheat to 5s, a consumption devoutly to be wished for by the farmers as well as the merchants.

EXTRACT OF A LETTER, RECEIVED FROM ST. CATHERINES, U. C.—I have now ready to ship to your market two hundred barrels of flour made of the finest new wheat, I have ever seen; all of it first rate seed wheat, and raised by myself. I, as well as my neighbours, are at present busy harvesting, and we have great reason to thank Providence for the bountiful crops we are reaping, and the favourable state of the weather. Our expectations have been more than realised. Knowing that it will be interesting to you, I will, in as few words as possible, inform you of my progress in harvesting:—We have been but a few days engaged, and have cut and put up two thousand five hundred bushels, have thrashed and cleaned 1760, and ground about a thousand; if the weather continues good, we shall thrash about 250 bushels a day during this week. I shall have in all about 3,500 bushels on my farm, which is a very fair quantity for one individual, and all of it the cleanest and most plump looking wheat I have ever seen. I do not recollect to have seen a kernel of chaff in all we have thrashed, and but little cockle, and not a shrunk grain in the whole of it.

I have upwards of forty men at work, and I do not allow them to taste either rum, whisky, wine, beer, cider, or cordial—nothing but pure cold water and good wholesome food; and I can assure you we get on with surprising celerity and cheerfulness. In one word, the crops in this vicinity are far beyond what was anticipated in the spring, and all are taken up with the business of securing the fruit of their labour.

PLOUGHING MATCH.—The annual Ploughing Match for the premiums offered by the Bath and West of England Society took place on Tuesday, the 8th Sept. on a piece of clover ley belonging to Sir Richard Hoare, bart, about half a mile from Stourton. At half-past nine o'clock there were thirty-one candidates in the field, all of whom had ploughs drawn by two horses abreast and (with the exception of 4) without a driver. The weather was very unfavourable, it having rained hard during the whole of the match, or there would no doubt have been a vast concourse of spectators, as very great interest was excited. The Committee who acted on this occasion were Captain Scobell, R. N., V. P.,

Thomas Davis, Esq., George Webb Hall, Esq., and Benjamin, Gray, Esq., who selected as umpires the following practical farmers, not having any interest whatever in either of the ploughs:—Mr. Robert Cross, of Mere, Mr. Andrew Bland, of Melbury, and Mr. Jos. Burbidge Sharp, of Moorhays, Somerset, who decided that the furrows should be eight inches wide and four deep, and that the work should be gathered in.

As soon as the competition was over, the Committee and a large party of agriculturists proceeded to the Stourton Inn, where an excellent dinner was served by Mr. Scammel; the Marquess of Bath having kindly presented a fine fat buck for the occasion. The party sat down at half-past 4 o'clock; Captain Scobell, V. P., in the chair. As soon as the cloth was removed, the Chairman gave "the King," as patron of the society, and reminded the company that this was the anniversary of his Majesty's coronation; he therefore called upon them to drink the toast with three times three hearty cheers, which call was most cordially responded to, and never was his Majesty's health drunk with more enthusiasm. Several loyal and appropriate toasts followed. The Secretary read two letters which he had received from Mr. Benett, expressing his sincere regret that his parliamentary duties prevented his being present, and taking the chair as announced in the bills.

#### ANNUAL MEETING OF THE ABBEY HOLME AGRICULTURAL SOCIETY.

[The following speech of Mr. Farrer is deserving of attention.]—Mr. FARRER returned thanks, and said, I can hardly take the compliment to myself, for I conceive that I am no longer a stranger here; it is true I might be so designated last year, as that was the first time of my attendance. But whether I am designated a stranger or not, I can say that I do not intend to remain so. (*Cheers.*) I have derived great pleasure from examining the farms in the district this morning, and I must say that the crops, if the weather had been altogether suitable, would have been very superior indeed. But it was impossible to overlook the effects of the drought, which here, as elsewhere, has operated against the corn. I will say also that I fear the harvest will not turn out so productive as it promises to the eye of a common observer. The corn generally, but the oats particularly, have not that rich golden hue, which distinguishes the most productive crops, but have a dark, livid, deadly appearance, which betokens that they will not yield so well as they might be expected. The crops of turnips are positively remarkable; we have not yet seen a single failure, and the produce must be most abundant. It is, I know, difficult to speak when all are so nearly alike in cultivation, but I may allude to one farm which does not come within the scope of our view this day. I had yesterday the pleasure of seeing my friend Mr. Samuel Rigg's crop, and as you all know what he has hitherto done, I can only impress you with an idea of what his crop is, by saying that it is as usual. (*Laughter.*) As regard potatoes, we all know that a progressive failure has been regularly going on in that valuable esculent, and it would be desirable to collect information which might check the failure, because it has now really become very serious. (*Hear, hear.*) And I have no doubt that if the failure goes on increasing in the ratio it has hitherto done, potatoes will almost cease to be worth the farmers cultivating. Whether that failure is owing to a disease in the seed, to the quality degenerating, to heat from their being piled together, and thus destroying the germinating power, or from what other cause, it would be advisable to learn. I can mention something resulting from my own experience, about potatoes; I last year got

some of Taylor's forty-fold, a very valuable kind, from Lancashire; I sowed them, and a better crop never grew. I gave some of them as seed to some neighbours, and afterwards heaped them together; and this year sowed them again, but there were no signs of potatoes; at last I beheld here and there, a thin wiry stalk something about the size of a knitting-needle peeping above the ground, and eventually it became a complete failure. But, Gentlemen, the principal thing to which I wish to call your attention is, that those of my neighbours who took seed from the heap, also experienced a failure, while those who took them before they were heaped, had a plentiful crop. (*Hear, hear.*) I do not say this amounts to a proof, certainly, but I contend that it furnishes a strong presumption that the vegetating power was destroyed in the heap. Having made a few other observations on the same subject, he concluded by again returning thanks.

MR. ELLMAN'S SALE.—The auction sale at Beddington, of Mr. T. Ellman's southdown sheep, on Friday, September 18, brought together a good sprinkle of buyers, many of them from distant counties, and a spirited competition was evinced. The 150 full mouthed ewes brought from 23s to 88s, average price, 44½s; the 50 six tooth ewes averaged at 45s. The 50 four tooth averaged at 42s 6d. The 100 ewe tegs sold from 35s to 84s, average, 47s. The 100 ewe lambs sold from 21s to 32s, average, 26s 6d. The 13 rams sold from 10 guineas to 28 guineas, average, 18l. The six ram lambs averaged 5l each.—On the day following Mr. J. Ellman's annual sale took place at Glynde, and was likewise well attended, and many of the lots were smartly contested for. The 100 yearling ewes sold from 40s to 105s, average, 52s 9d. The 170 aged ewes sold from 30s to 115s, average, 45s 6d. The 12 rams were let from 10 guineas to 20½, average, 12 guineas.—At the show of ram lambs the silver tankard was won by Mr. H. Boys, of Kent, beating nine others. A gentleman by the name of Raven was a purchaser of several lots of the young ewes, who stated that a ewe he bought at the Glynde sale two years back, produced a ram, now a tag, whose fleece weighed the extraordinary weight of 11lbs, and of the very first quality, and that no money would now purchase this ram.

ABYSSINIAN WHEAT.—This description of wheat was introduced to the neighbourhood of Dunbar by Lord Lauderdale, and sown in his experimental park on the 13th of November last, after a crop of clover of an Italian species. Although the wheat was sown of common thickness, not above one-half of it braided, but the plants tillered out very much, and it came into ear with the other descriptions of wheat generally sown in this country. The ear is bearded, and consists of one principal and many smaller ears growing out from its sides at irregular distances. Should the pickles all come to maturity the number must be very great, and the crop productive. The straw is large, and not tubular, as in other wheat, but filled with pith, and is strong and solid. From its thickness and inflexibility, it will not answer for bedding.

The annual demand of timber for the Royal Navy in England, in war, is 60,000 load, or 40,000 full grown trees, a ton each, of which 35 will stand on an acre. In peace 32,000 tons, or 48,000 loads. A 74-gun ship consumes 3,000 loads, or 2,000 tons of trees, the produce of 57 acres in a century. Hence the whole navy may consume 102,600 acres, and 1,026 per annum

## THE HOP.

This crack place for the growth of that aromatic bitter the *Lupuline*, is proceeding with rapidity in bringing them to a marketable state; most growers will, by this time, have begun their picking, and although the quantity in general, will not exceed one-third of the last year's growth, still the cultivators calculate, that this deficiency and the superior quality (as evinced by the quantity of seed and golden like appearance of the condition,) that they will be able to realize a third more price at the next Weyhill fair. The luxuriant growth of last year made many king hops, as they are locally called, and consequently depreciated their pungent bittering quality; this year all is compactness and weight, and not the least cause thereof is the increasing culture of the male plant in the neighbourhood, as recommended by *Lance in Baxter's Library of Agricultural knowledge*, and in the *Golden Farmer*. The deficiency of the crop in this corner of Surrey and throughout Hampshire, as now so fully proven in the drying-house, does not at all agree with the high quotation of the duty, and a visitor through the hop districts would soon be convinced that the estimation now set at 30,000*l* above the growth of last year, is quite fallacious; indeed there must be some sinister motive on the part of the buyers and speculators, thus to keep up the estimate of the duty; what is now quoted would make the average of the whole 51,000 acres in culture to exceed  $8\frac{1}{2}$  cwt per acre, this is next to impossible this year, from what we know, from the pulling of the bine and the talleymen's account.

A visitor to the hop gardens at this season cannot help reflecting on the primitive method of keeping accounts, by wooden talley, and associating therewith the destruction of our houses of Parliament; we may now see strutting about our hop gardens, a "Teller of the Erchequer" in all the arrogance of power, but to think that our late Tory government should have retained this primitive mode of keeping accounts until within these few years, is truly astonishing, but what will not the prejudices of peculiar education retain, we know it has scarcely any bounds, either in ecclesiastical or civil legislature, or commercial transactions.—Farnham, Sept 5.

BRISTOL, Sep. 12.—We have now the pleasure to wait upon you, as usual, at this season, with a report on the state of the late harvest in this and the adjoining counties; founded on the accounts we have received from a large number of intelligent correspondents—and we trust it may prove interesting. The wheat crop in the early part of the year wore a most luxuriant appearance, and promised the greatest abundance; towards the latter end of June, however, we were visited with some extremely heavy storms of wind and rain, which so much beat down the crop, that it never recovered. The weather since then has been almost uninterceptedly fine, and has had the effect of bringing to maturity, what was laid, to an extent that could not have been anticipated. The bulk of the straw is very great, and though, where the flail has been in use, we hear some complaints of the yield, yet we incline to the opinion that in quantity it will be found to be a full average produce; and though there will be some thin samples, the generality will prove of fine quality. It has all been secured in the best possible condition. Some few samples have appeared at market, and been selling at 4*s* 3*d* to 4*s* 6*d* per bushel. The crop of barley is said to be superior both in quality and quantity, to any that we have had for some years past, and the samples we have seen fully corroborate this opinion. Owing to the extreme dryness of the weather, it is somewhat flinty, and will not work freely, until it has been some time in the mow. There are but few oats grown in this neigh-

bourhood; the crop is, however, a good one; though in some districts, the quality is not so fine as was anticipated. Beans and peas are both spoken well of: the latter especially are reported to be abundant, and the samples of very fine quality. Owing to the extreme drought the potatoe crop has been a very general failure. The crop of hay was abundant, and secured in the finest order; but owing to the scarcity of grass it has already, in many places, been extensively used for foddering the cattle."

EFFECT OF RAILWAYS ON ESTATES IN ENGLAND. An opinion has been entertained by some that the value of an estate is depreciated by a public railway passing through it, and that a reduction in the rental must take place in consequence. With the exception of cases where a railway approaches near a country mansion, or goes through a gentleman's park, the reverse of this is the general result: and in nine cases out of ten the estate is considerably enhanced in value. The truth of this proposition cannot be better evinced than by the facts, that on the line of the intended Liverpool and Leeds railway some of the occupiers of lands and mines in its vicinity have voluntarily proposed to pay an increased rent in the event of the railway being established; and that a very considerable increase has actually been offered by the tenant of a nobleman through whose property it is to pass for several miles.—*Railway Magazine*.

THE BLACK CATERPILLAR.—Letter from Mr. Frederick Hotham, of Dennington Suffolk:—"As myriads of small black caterpillars (called by the labourers 'Black Jack') are devouring whole fields of turnips in this neighbourhood, it may be interesting to your agricultural readers to know that they may easily be destroyed by a cart-rope drawn over the stretches six or seven times a-day by two men or a man and a boy, who walk in the furrows, and sweep four stretches at a time. By this mode I have every prospect of saving a field of very fine white turnips (too large to be rolled according to the Norfolk plan,) which was covered with black caterpillars, after I had ineffectually tried the use of soot, 7 bushels of which had been sown per acre at day-break, when a strong dew was on the turnips, with very little apparent benefit. The caterpillars thrown off the leaves of the turnip by the action of the rope endeavour to regain their former station, and many of them succeed in doing so; but after the stretches have been swept several times they diminish very much in number probably some are destroyed by the rope itself; and many more are bruised and injured by repeated falls, and are languid from the interruption occasioned to their gaining food. In two days I have destroyed the greatest part of the caterpillars, and in two or three days more I flatter myself the remainder will entirely disappear."

Mr. Teverson's twenty-fourth Annual Sale of sheep, consisting of 2,400 of the purest Sussex breed, took place on Tuesday, at the Valley Farm, opposite the 51st mile stone on the London road. The celebrity Mr. Teverson has obtained in selecting the purest South-down ewes for the purpose of breeding, drew a large and most respectable assemblage of gentlemen and agriculturists from the adjoining counties. The result of the sale must have been highly satisfactory to Mr. Teverson. The Shearing ewes averaged 29*s* per head, some of them fetching 41*s*. The sale part off most pleasantly. Upwards of 100 gentlemen sat down to dinner, who were highly pleased with this hospitality they received, as well as delighted with the singing of several gentlemen present. The healths of the buyers were proposed by Mr. Nockolds, Mr. Clutton, and other gentlemen, who expressed thanks to Mr. Teverson for the improvement which had been introduced into the flocks of Cambridgeshire and the adjoining counties by his great exertions. The company did not leave till a late hour.

## AGRICULTURAL REPORTS.

### OXFORDSHIRE.

We are now enabled to report the important labours of the harvest as all but finished, a few beans, and but a few, remaining in the fields. It may without fear of contradiction be asserted, that within the memory of man the corn was never harvested in a better condition, and but very rarely so good. Nor can we be sufficiently thankful to the bountiful Giver of all good, who has, through "the appointed weeks of harvest," favoured us with such suitable weather for gathering the grain; and, when most of it is safely housed, has sent us a fine rain, sufficient to set the ploughs going, and to renovate the parched herbage, which has again assumed a verdant appearance.

We can now speak more correctly as to the yield of the wheats from the straw, and hesitate not to affirm, that on all the best and most highly cultivated land an unprecedented quantity of straw must be beat over to produce a bushel of wheat. We are aware there are some exceptions as to yield, where, owing to a cold bad soil or to bad management, in either case causing the crop to be too weak to be lodged; in those cases a fair quantity may be produced from a given portion of straw and of good quality; but this forms the exception, and not the rule. The worst farmers will this season be able to produce by far the heaviest and best samples of Wheat, perhaps the acreable produce may not prove below an average, yet we are not to expect any thing like the product of the two last years, especially the crop of 1833, or, if we do, we shall certainly be disappointed. As it respects the former of these years, we will venture to say that so great a bulk of flour was never produced in England in any one year since the creation as that of 1833; this may be deemed a bold assertion, but we are confident it can be proved.

On inquiry, we learn that the labourers' plots of wheat upon some of the best corn land in the county yield, on an average, about 3 imp. bushels to the chain, and this (be it remembered) on land cultivated by spade labour, consequently no weeds allowed to injure the crop, and every ear of wheat secured. We have extended our observations on this article, because it is all important to the sustenance of man, and because we are persuaded a great deal of misconception and exaggeration has gone abroad relative to the wheat crop just gathered.

Barley, oats, beans, and, we may add, peas, particularly the latter, are undoubtedly of superior quality, and heavy in bulk; but little barley has been shown at markets, complaints being made of the new barley not working well, being steely. The price of barley cannot be said to be fixed, so little new has yet been sold, but harvest being ended, we shall soon have an increased supply in the markets; at the same time we are aware that many maltsters are *entirely* out of stock, and are now being supplied by the *few* who are considerable holders of old malt: added this, the potatoe crop is likely to prove so deficient that this article already bears a very high price, other things considered. We noticed in our last, the extraordinary quantity of beer consumed in gathering the harvest, all these things must tell and have an effect upon the markets.

Perhaps in wheat it might not operate so forcibly, because if markets are likely to advance here, in comes the heavy stock in bond, and soon depresses the markets: but we conceive it will be difficult to find foreign barleys *equal* to, or likely to compete with those of English growth in a season such as this.

The complaints of the ravages of the black caterpillar, grub, and wire-worm, are universal, and thousands of acres have been entirely swept off, to the great loss and disappointment of the owners. The Swedes have in a great degree escaped the destruction, but they were beginning to mildew; we hope the fine rain will tend to recover them. The trifolium incarnatum has fluctuated greatly in price; for several weeks it was scarcely saleable, and when sold it was as low as 20s to 21s per cwt; the same seed would now bring from 36s to 40s and upwards wholesale.

The markets for wheat are most sadly depressed, wheat selling under 4s per bushel; ruin staring the farmers in the face, and yet our county members have allowed the session to pass over without making one single effort to obtain any relief whatsoever; surely they will not dare to look their constituents in the face again. A very heavy charge of broken promises and empty professions await them ere long. There does not appear to be much doing in wool just now. Men's wages for the month have been three pounds and beer, or two bushels of malt per man.—Sept. 9.

### BERKSHIRE.

Such a harvest as the present one has not occurred for many years, and never do we recollect the corn put together in better condition or with such little trouble. During the principal part of the time there has been neither wind or rain, dew, fog, or mist; so that the corn has been nearly as dry by night as by day; it has required such little judgment, that even a cockney could scarcely have done wrong. In the south and east parts of this county the harvest is quite completed, and in the other parts of the county it will be mostly finished before this account is printed. The crop of straw is in general a bulky one, and the show of ricks is certainly greater than it has been for many years; every piece of corn filled up more room than the owner expected, and to look at the rick-yards there is certainly a flattering, but we fear a fallacious appearance. It is, in our opinion a good sign when the show is great in the field, and when carried together makes but few ricks, as in such a case there is always a considerable weight of grain that presses it down so as to make it lay close together. This was the case last year, and the yield proved most abundant, every stack producing more than was expected. On the contrary, at the present time, the corn was beaten down with the wind, the straw became very crooked, the sheaves were in general light, and it lay very hollow and filled up amazingly, but the produce, in our opinion, will be far from satisfactory. Many farmers have already begun thrashing with the machines and with the flail, and we can scarcely hear of an instance but that the quantity was considerably less than was anticipated. The wheat when thrashed is uncommonly heavy and pretty good in the sample, and in excel-

lent condition for hoarding, and although the markets are at the present time extremely depressed, yet it is our firm opinion that if other counties are no better off than this wheat ere long will be dearer. At this time last year the wheat was in a damp state and much sprouted, and totally unfit for keeping; the harvest was also very early, and the farmer had nothing but wheat to sell; this grain yielded well, and it was hurried in so as to stagnate the market before any was required for seed; the potato crop was also an exceedingly good one. This year every thing is different, the quality is good and sound and fit for keeping, the yield out of the straw is very bad, and it cannot be brought but about half so fast to market as it was last year; the farmers have also barley, oats, peas, and beans to dispose of, a part of which they can thrash to make a little money to pay the way, and much of the wheat that can be got ready will in the course of a few weeks be wanted for seed, and, from every information we can at present collect, the produce per acre will fall short about a fourth of last year's crop, and the crop of potatoes is also a very deficient one. New wheat is selling at from 35s to 45s per qr, and, considering both the quantity and the quality, the speculation in wheat at the present time to all who have capital is certainly most inviting. The barley crop also fills up more room than we expected, and we are fearful that the yield will not be so good as we anticipated. The Chevalier barley appears almost every where most excellent, and the quality very fine, and it weighs between eleven and twelve score per sack. The produce of wheat that has been thrashed is about two-quarters per acre less than we expected, and it is supposed after all that the old sort of barley will produce as much per acre where the crop did not look near so good. The price of the Chevalier at present is about 32s per qr, but the maltsters are not very eager to purchase even at that price, having an idea that it will be lower. The late sown barley is bad in quality, and very much blighted; but the early sown being good, it is calculated that altogether the crop will be nearly an average one. The stock of malt in hand is short, and we know not of one parcel of old barley left, so that there is every probability of there being a good trade for this grain as soon as ever it will work for malting. The bean and peas crops are both better than they have been for many years; they are exceedingly good in quality, and there being but few old beans in the country, the new ones can now be readily sold at 9l per load. The oat crop is not so great in bulk of straw as the other sorts of corn, but will, we think, yield better out of the mow than either barley or wheat. There are scarcely any old oats in hand, and good new ones are worth about 25s per qr. Winter vetches are small, and do not yield very well; they are uncommonly dry, and worth from 6s to 7s per bushel. Apples are a fair crop, but, the summer having been so dry, they are small in size. The potatoes are very much dried up for want of rain, and there will be scarcely half a crop; they are selling as high as 8s per sack.

This has been a most excellent year for honey; the hives of bees are every where uncommonly rich, and we hardly ever remember such a year before. The length of the wheat enable the reapers to pick it up clean, so that there is but very little left behind this year for the gleaners; many of the poor refused to go a gleaning, and even let the rooks and other birds devour what was left behind, saying that the price of bread was low, that the wheat was not worth picking up, and that they could do a great deal better at other work. Last year a majority of the poor

obtained enough at gleanings to keep them in bread until Christmas, but this year they have not procured enough to serve them until Michaelmas; this neglect, with the deficiency in their potato crop will we think, be hereafter severely felt by the poor.

A deal of mischief has been done to our turnip crop by the black maggot, some thousands of acres in this county alone having been entirely eaten up as bare as a fallow field. About the 1st day of August there was observed buzzing about amongst the turnips a large shining yellow fly, who at that time was no doubt busy laying its eggs on the leaves of the turnips, for in about a week afterwards there were observed crawling about on the same an immense number of small black maggots or caterpillars about a quarter of an inch long and about the size of a small needle; they eat and grew at a most rapid rate, and in the course of a few days they were an inch long and the size of a wheat straw, and carried destruction and devastation wherever they went. When touched they instantly rolled themselves into a ball like a hedgehog and fell on the ground. Many and various were the schemes that were tried to put a stop to their devastations; some persons sowed lime, and when applied very hot it certainly destroyed many, but as the lime soon lost its virtue, and numbers were sheltered on the undersides of the leaves where the lime could not reach them, the remedy did not prevent the evil; other persons tried salt, but that was of no service, for a sufficiency to destroy the insect destroyed also the turnips; others rolled them, and where the ground was very smooth it killed a vast number, but still it did not kill them all, and when the turnips were small there was enough left to destroy them, and if large the turnips were so bruised as nearly to spoil them; others dragged cart lines a cross their fields, and pulled them off the leaves, but it did no good for they were up and eating again in the course of an hour or two. Some persons rode about the country to purchase ducks to eat them, and they did some good, but all the ducks in the country would not have been sufficient to have eaten the maggots that were in one village; others tried to tread them to death with sheep, but we are sorry to say that all the schemes and all the plans were but of little avail, and it is probable that had there not come a few showers of rain and a frosty night or two, there would not have been by this time a turnip left in the country. Since the showers we have observed but very few of the maggots, and we are in hopes the most of the mischief is over, but the damage done is immense, and sheep and lambs are already fallen five shillings per head in the course of the month. Many persons have been ploughing and sowing the land again, but it is doubtful whether it is not too late to obtain any sort of a crop; other people are anxiously waiting to see whether the rain will enable the plant to put out fresh leaves. It is remarkable that it is more than thirty years ago when these insects appeared the last time in numbers sufficient to do any damage, and it is probable that the calm warm sultry nights and days, with the total absence of all dew, fog, or mist, has been the cause at the present time of bringing every egg to perfection and made them so numerous, whereas in other years most of the eggs were probably destroyed by cold or damp, and proved abortive; and it appears also that the eggs were laid only on the leaves of the turnips and not on rape or Swedes; but they have eaten both of the latter plants after they had devoured the turnips if they grew amongst them or very near. The turnips that were just hoed out are all destroyed, but the early sown turnips which were large and thick on

the ground, will we hope, somewhat recover. The grass is all dried up in the stubbles—the latter mowth clover is all gone—the meadows and pastures have no feed—and there is scarcely any sheep keep in the country, with the exception of a little feed on the sanfoin, and that is not half so much as usual. The brooks are drying up very fast, many of the fish are dying, and the springs are lower than they have been known for these fifty years in the month of August, and in a very short time the wells will become empty, and but few of the mills on village streams will be able to do much work. It is a most excellent time for carting manure, but scarcely any of the land can be ploughed for wheat, it being so dry.

#### EAST RIDING OF YORKSHIRE.

The drought in the early part of this month was excessive: on the 12th a fine rain occurred, which, though partial in its influence, extended over the greatest part of the Riding, and afforded much benefit. This was succeeded by 12 days of considerable heat, when the full sun, with often a free air, greatly parched the soil; though at the same time it rapidly ripened the grain. On the 24th and the two following days, we were again blessed with refreshing showers; the rain which then fell, was sufficient in quantity to penetrate the earth to a considerable depth, and yet did no injury of moment to the wheat, either in the sheaf or still uncut. The last 5 days have been highly favourable.

Harvest may be stated to have commenced on the 10th, in Holderness on the 17th, and upon the Wolds on the 20th: in point of date, it can neither be termed a late nor an early harvest. Wheat is a full crop, and the grain is good, with trifling exceptions of a very partial deficiency arising from "deaf ears," probably occasioned by a severe frost when in bloom. A great quantity of this grain has been already secured in excellent condition. Barley, though not a heavy crop, is considerably better than it was last year, and the same may be said of Oats and Beans: the latter have not entirely escaped the destructive attack of the Aphis, but those insects appear too late to do any extensive injury. The report of the state of corn-crops, may, therefore, on the whole, be termed favourable.

Turnips were drooping much, and by no means promising, until they were refreshed by the late rains; since then they have resumed a vigorous growth, and the failures are only partial. The value of Swedes is every year more acknowledged, by the increased quantity sown; and we are glad to notice that the attention which has been paid to them this season, is likely to be fully rewarded.

Potatoes will be small, and the crop from this cause, in addition to the original failure from the dry rot, will be unproductive; but so greatly has the cultivation of that root been extended throughout the kingdom, that there is no doubt but the supply will fully equal the demand.

The pastures have been greatly burnt up, the "fog" has been completely at a stand, and a consequent failure of food for cattle of all descriptions has occurred; the change given to the verdure of grass by the recent rain, affords promise of relief from that inconvenience. The rain has, indeed, been most beneficial to all vegetation.

We would remind our brother farmers, that when deficiencies now appear in the young plants of red clover, this is the proper period for sowing the vacancies with the "*trifolium incarnatum*" or scarlet clover, and that the best method is to harrow it in upon the stubble. We would also again urge the sowing—

and early sowing—of the winter tare, as decidedly the most productive and useful crop for soiling. There is no situation in which the omission of this is not attended with loss. As food for draught cattle, and for pigs, through May, June, July, and August, it is invaluable, and therefore, a small quantity should be put into the ground, at different periods, the first of which has now fully arrived. The holders of sheep on the plains ought to remember, that so soon as the autumnal rains commence, the flock should be provided with salt, to promote their health and ward off the rot. Let them have constant access to it, in a covered trough, and they will soon learn to avail themselves of the medicine that nature dictates the use of;—a little corn over it will hasten the tuition, and be of good use in hot weather. The manufacturers have borne a great reduction in prices, by a yet greater improvement of their machinery, and skill in the execution of their work; and thus, we can only hope to bear up under the present low prices by the greatest attention to the first principles of agriculture, and the minutiae of good management in all rural affairs.

Wheat has advanced a little in value through the month, and other grain has not receded. There has been a considerable depression in the price of live stock generally; but perhaps, this may be partly attributed to a scarcity of grass.—Sept. 1.

#### SUFFOLK.

The month of August brought to a close the finest harvest we ever witnessed, and all kinds of produce are secured in the best possible condition, and from what we can learn by those who have commenced thrashing, our former anticipations will be realized, viz., that the yield will prove a fair average; we hear of here and there a farmer getting prodigious crops, but we always regard such statements with suspicion, believing there is some sinister end in view in raising such reports, as its accompanying effect is not apparent (the realization of an independence) sooner than their less fortunate neighbours. Some parts of this county have experienced refreshing showers, in a few places unusual and alarmingly heavy storms, whilst others have had barely sufficient to lay the dust in twenty-four hours. From the 15th ult. to the end of the month the black caterpillar, or "Black Jack," made shocking ravages amongst the common and Scotch turnip. Various were the plans contrived to check their destructive powers, dragging a cart rope, rolling, harrowing, sowing lime, salt, &c., &c.; but no experiment has saved effectually a single piece when once attacked. It is upwards of thirty years since we last were visited by such gentry, and we hope it may be ten times thirty ere they again make their appearance amongst us. We would further remark, we see no chance, even should the most favourable weather ensue, for turnips, which have been attacked by them, to be even a moderate crop. Swedes have not suffered from the Black Jack, but from the great want of rain at convenient intervals, they are very much injured by grub. Mangel wurzel are promising to be a fair crop, and will prove the only stay for the grazier this year. We are happy to state great preparations, and a larger breadth of land will be sown with rye, vetches, and trifolium incarnatum this year than heretofore, and we would earnestly recommend that all lands intended for summer fallow (not wanted for mangel wurzel or early turnips) be sown with some kind of artificial feed, either to be fed on the land, or for soiling cattle in the rack yard, or to be made into stover hay for winter provender, as by that means double the

quantity of stock may be kept, and in consequence of more stock being kept, more manure will be made, and ultimately more corn grown, as, from the low price of agricultural produce, double the quantity of stock wants to be reared and fattened, and an extra quantity of corn grown in any way, to compensate the agriculturist. The provincial papers begin to give striking proof of the ruined condition of the farmers; would that our legislators would devise some more immediate remedy than the Poor Law Amendment Act; that may be an ultimate benefit, but we fear its effects are too distant, and that many who ought to have been the guardians of the poor will be now found amongst the inmates of the workhouse.—Sept. 18.

#### CUMBERLAND.

The past month was highly favourable for finishing the hay harvest, and also for perfecting the ripening of the grain crop, particularly in the early districts. Wheat is now all cut, and nearly all secured, and in the best possible condition; it has taken much better off, than was at one time expected. A strong gale of wind accompanied with heavy rain on the 22d June broke down the straw at the time of its coming into ear, and it was then considered that the produce would be affected, but the weather since has been so favourable that it may now be estimated to be a fair average crop in quantity, the quality not so fine as we have had for the last three years. Barley is a full crop and good in quality, particularly in the chevalier. Oats upon light lands are a light crop, but upon heavy soils generally productive and fine in quality. Potatoes, where well planted will be a fine crop. Turnips in many situations made bad progress for a long time, but now they are improving; and upon well tilled land will produce a good crop. Pastures are short in grass, but stock is doing well upon them. Our cattle markets are very dull on account of the heavy complaints of want of grass in the south.—Sept. 7.

#### NORTHUMBERLAND.

The harvest commenced here about the 7th ult. and the following week became general in this district, and is now near a conclusion, that is the cutting part. The latter part of last week, and the beginning of this, has been very tedious, for, owing to the showery unsettled weather, the reapers could scarcely ever get a whole day; and the process of leading has been equally slow, having scarcely ever had a breeze of wind to dry the heart of the sheaves, and, in consequence, there has been some corn rather heated in the stacks. There is full one-half of the corn standing out yet, and which, if the weather continue in this moist damp state, must soon take harm.

The crops have cut up much better than was anticipated at one time, although the samples upon all light dry soils will be small and lean in the pickle, owing to the severe drought, but they vary much according to the quality of the soils; upon the whole it is considered a full average crop.

The turnips are a good crop in general, scarce ever better, and the aftermaths very much improved since the rains commenced. Potatoes are a failing crop in this district, which will be a great loss to the poor labourer.

Our corn markets keep in a very depressed state; old wheat scarcely saleable, prices from 4s 6d to 5s per bushel for the very best; new from 4s to 4s 4d if good—but a great deal comes raw to market. New oats from 2s 6d to 3s, barley 3s to 3s 4d per bushel.—Sept. 16.

#### KILKENNY.

We never had a more propitious harvest, the greater art of its labours having been accomplished in this month, and nothing can exceed the dry curing and saving of every description of corn and hay; and they are in most wholesome state.—Even now, commencing a new month, there is every prospect of a continuance of fine weather, which, we trust, will not only bring to maturity the late mountain crops, but will enable to be saved in a manner the most agreeable. Many farmers are now collecting wheat into the stack-yard; and as that process brings it under the immediate inspection of many, it renders it a critical period for remark. We shall commence ours with wheat.

Wheats are variable—all appear better to the eye than otherwise, and in the field stacks and even in the stack-yard, there appears the most trifling shedding of grain. At other seasons barrels in an extensive stack-yard have been collected on the sheets, caused by the plumpness of the corn, a matter that does not now occur; and, we fear, is a proof, an unerring proof, that the grain has not filled sufficiently. There has been little or none yet at market, and those that have thrashed complain loudly of the deficiency, as also the toughness they experienced in thrashing. Notwithstanding this deficiency, (if it should turn out so), it will be remedied by the great breadth. The prices are from 15s. to 19s. a barrel, a price, even if the land was rent free, could not nor would not remunerate the farmer. This circumstance would induce a question—how are rents, taxes, tithes, police charges, farming utensils, and manuring to be made out? They cannot; and what evidently must follow?—a further and more alarming description of lands in tillage, as the great bulk of farmers cannot afford to manure them.

Barleys are good and in a forward state of being reaped and saved. They have opened, too, at a better price 12s. to 13s. a barrel. We think there is an average breadth, with a full average produce.

Oats are excellent in every respect—they promise to be abundant and good. We don't perceive any thing to interfere with our hopes, save the latter or poor man's harvest turning out wet.

Potatoes are a large breadth. They are for the most part good; but we must calculate on some exceptions, particularly in light thin soils. There has been an abundant supply of old potatoes, which providentially rendered it unnecessary to interfere with the growing crop.

Hay is abundant and good, and selling low. Dairies would do well this season, as pastures are abundantly supplied with grass, but the demand for butter sinks the price. Beasts are feeding well. The pastures are luxuriant and full of grass,—price of beef moderate. Sheep are also feeding well, gradually declining in value, which value had been enhanced by the one year's unprecedented price of wool; an article now selling at a more prudent price.

The impoverished state of the farmer is now but too visible, and will evidently produce (at no distant period) a shock, by which a mischief will very generally be felt; and why? He has no means, and consequently his expenditure must be next to nothing. This interferes with the shopkeeper, merchant, and tradesman, who can sell but little, and for that little in most instances will be unpaid. True, we have a large loaf and cheap, but the means to purchase is wanting; and will not this state of things interfere with landlords, whose expenditure must of necessity, correspond with their curtailed rental.—Aug. 31.

# AGRICULTURAL INTELLIGENCE, FAIRS, &c.

## COTTESMORE PLOUGHING MEETING.

THURSDAY, SEPT. 17, 1835.

We are happy to say, that this was the most interesting meeting that has yet taken place on any similar occasion. It is supposed that there were near three thousand persons assembled to witness the interesting proceedings of the day; amongst whom were Sir G. N. Noel, the Hon. and Rev. Leland Noel, Rev. Henry Neville, E. W. Wilnot, Esq., and a large party of gentlemen. The above-named gentlemen and their friends afterwards dined at the house of R. W. Baker, Esq., and were highly gratified with the hospitality of that gentleman, to whom the county of Rutland owes so much for its improvement and rapid progression in agriculture. The various prizes were awarded by the judges as follows:—

### PLOUGHING.

**CLASS 1.**—A Silver Cup, value Ten Sovereigns, given by Sir Gerard Noel, Bart., M.P., to a Farmer's Son of Rutlandshire, not in business for himself, who shall plough in the best manner half an acre of land in three hours and a half, not less than four inches deep, (horses abreast,) without a driver.—No Winner of the First Prize in any former year to Plough for this Cup.

To. No. 4, Richard Hack, of Brooke.

**CLASS 2.**—Five Sovereigns, given by the Right Hon. the Earl of Lonsdale, Sir Gerard Noel, Bart., M.P., G. J. Heathcote, Esq., M.P., Hon. C. Lowther, M.P., Revs. Neville, Baker, and Ellicott; Baker, Bury, Willmott, Neale, Ransome, Esqrs., and others, to the Ploughman of any county who shall plough in the best manner half an acre of land as in class 1.—Second best, three sovereigns; third best, two sovereigns; fourth best, one sovereign; fifth best, half sovereign.

**A Silver Cup**, value Five Sovereigns, given by Sir Gilbert Heathcote, Bart., M.P., to the owner of the first Prize Plough in class 2.

1st Prize, five sovereigns, to No. 13, James Goodger, servant to Mr. J. L. Arden, of Morton, near Bourn; 2d., three sovs., to No. 15, Wm. Busby, servant to Mr. Matthew Laxton, of Greetham; 3d., two sovs., to No. 5, John Adams, servant to James Rice, of Cotten End, near Northampton; 4th, one sov., to No. 27, John Townsend, servant to R. W. Baker, of Cottesmore; 5th, half a sovereign, to No. 21, John Downs, servant to Mr. Rowland Buckworth, of Pickworth.

All the Ploughing good, and particularly the second Class, which, almost without any exception, was excellent work,—better than had ever been seen upon any similar occasion.

**CLASS 3.**—To the Ploughboy of Rutlandshire, under 18 years of age, who shall plough half an acre as in class 2.—First prize, three sovereigns; second prize, two sovereigns; third prize, one sovereign; fourth prize, half a sovereign; fifth prize, a crown.—A silver medal given by William Leake, Esq., to the owner of the first prize plough.

1st Prize, three sovs., to No. 7, John Thorell, servant to George Hilbett, of Exton; 2d, two sovs., to No. 2, James Hare, servant to Matthew Laxton, of Greetham; 3d, one sov. to No. 4, John Allen, servant to John Dalby, of Exton; 4th, half a sov. to No. 3, Thomas Retcher, servant to Mr. William Hammond, of Barrow; 5th, a crown,—not sufficient merit.

The Match which was to have been ploughed at this Meeting, between two farmers' sons of Rutland, against two farmers' sons of Northamptonshire, stands over for 1836.

## SHEPHERDS.

First Prize, one sovereign, given by R. W. Baker, to the shepherd who has reared on the 1st of June, 1835, the greatest number of Lambs from Ewes put to Rams hired of him in 1834, not less than eighty Ewes. Second prize, half a sovereign; third prize, a crown.

1st Prize to Aaron Crowson, shepherd to Mr. Bagley, of Wing, who reared 90 lambs from 80 ewes.

2nd Prize to John Freeman, shepherd to Mr. Beridge, of Barrow, who reared 210 lambs from 200 ewes.

The Sheep of R. W. Baker, Esq., were universally admired by a very large company. Fifty were shown, and 49 let for the season, from 6l to 16l each.

## HUSBANDRY.

A Silver Cup, value ten sovereigns, given by Sir Gilbert Heathcote, Bart., M. P., to the Tenant Occupier of the best cultivated Farm in Rutlandshire, not less in quantity than Eighty Acres of Arable Land, the neatest and most exact manner of cropping, fences, water-courses, gates, stiles, farm-yards, &c., &c.; and also the land drained in the best manner, and clearest from weeds.

To Mr. John Christian, of Barrow, tenant to the Rev. Henry Neville, who filled it with crown pieces, amounting to 33l.

One or more Premiums, according to merit, given for good Stacking and Thatching in the county.

1st Prize to John Bott, servant to Mr. Henry Stimson, of Oakham.

2nd Prize to William Clements, servant to Mr. Bagley, of Wing.

A Match between two Ploughs, for five sovereigns did not come off. In all 48 Ploughs entered, and 46 started.

One Prize was won by Ransome's Bedfordshire Plough; one prize by a Northamptonshire Plough; one prize by a Casterton Plough, by Bird. The remaining prizes were all won by Ransome's Rutland Ploughs, which were made at the suggestion of Mr. Baker.

(Signed)

DANIEL LARRATT.  
SAMUEL CHEETHAM.  
ROBERT BUNNING.

**IPSWICH LAMB FAIR.**—The annual mart commenced this day with a short supply compared with the two former years, there being from 40 to 50,000 short of sheep and lambs, and the hurdles delivered being about 55 dozen short of last year. The business of the day was very confined, few sales having been effected, and many of the flock-masters were scarcely asked the price of their lambs. The company was by no means numerous, which was accounted for by the markets of Norwich and Colchester falling upon the same day. The lambs were in good condition considering the drought during the summer season. There were but a few stands of beasts, and no business done that can be quoted for this kind of stock, the turnips having every appearance of being consumed by the great drought and black jack insect, which is at this time very prevalent upon the plant, and which to all appearance will destroy them should the rain hold off for many days longer.

## DOWNES.

Y

MONDAY.—The fair this day was well supplied with both sheep and lambs, and the business was much more improved upon the trade of Saturday, as far as sales being effected, but the prices were short from 4s to 5s upon the last year's return, and in many instances the flocks are turned out unsold, having scarcely been asked their price. Mr. James Munnings, of Haughey, showed two excellent pens of half-bred Downs, which were much admired by the breeders of this stock, and which brought 27s 6d and 26s 6d per head. Down shearling ewes and wethers fetched from 26s to 36s per head. Mr. Ransome's show of agricultural implements were much admired by the gentlemen interested in agricultural pursuits, and they received the usual patronage by receiving orders to a great extent for their ploughs, dressing machines, chaff and turnip cutters, which latter they have considerably improved upon. The following were some of the highest prices obtained:—

SECOND FALKIRK TRYST.—This great leading market for sheep, was held on Monday the 7th inst. The number on the ground was computed at from 20,000 to 25,000, being about 10,000 less than last year. The state of the pastures in England prevented the usual number of dealers coming forward, consequently, all descriptions of stock suffered a severe depression in prices, and the result of this day's market was a fall of 5s to 6s a-head, compared to last year, and a good many unsold. Prices as follow: best white-faced wethers, top price, 26s a-head; next best 24s; current, 21s to 23s. Black-faced wethers, 22s; current 18s to 20s; some small lots, 12 to 14s. Cheviot ewes, top, 18s; current, 15s to 17s. Black-faced ewes, top, 13s; current, 8s to 12s. Most of the ewes sold, but wethers met with a very dull sale, and a good many left unsold the first day, but it is probable that nearly the whole would be moved off the following days, before the final close of the market. On Tuesday the 8th inst, the cattle market commenced, the number exhibited was supposed to be from 20,000 to 23,000, being about 5,000 less than last year. Cattle also, from the same cause, the universal barren state of the pastures, met with a very heavy sale, and the result of this day's market, compared to last year, was a fall in prices equal to 20s to 25s a-head, or ten per cent on the average value, with the exception of superior fat cattle, which readily brought equal to 7s per Dutch stone. Prices as follows:—The best Aberdeen and Angus-shires, four-years-old, fat, 17l and supposed to weigh 50 stone Dutch; four-years-old do for feeding, 11l to 13l; three-years-old do, 7l 10s to 10l. Best Highland four-years-old, 7l to 7l 9s; three-years-old do, 5l to 6l 15s; two-years-old do, 4l 10s to 5l. West Highland Queys, best, 5l to 7l; three-years-old do, 4l 10s to 5l; two-years-old do, 3l 10s to 4l 4s. Milch cows, 7l to 11l. A considerable number of cattle unsold, but it is anticipated that, should the weather continue favourable, much better prices will be obtained at the October Tryst.

LINCOLN FAIR, Friday last. The supply of horned cattle was very large, which sold well. Early in the morning the jobbers seemed anxious of purchasing and a great deal of business was done. There were several horses offering, but nothing of a description worth noticing, however many exchanged owners.

## MEETINGS OF AGRICULTURAL SOCIETIES, ASSOCIATIONS, CATTLE SHOWS, &c. TO COME.

[We shall feel obliged to some of our readers as will forward to us any local newspaper containing the announcement of annual meetings, for insertion as below.]

Teviotdale Agricultural Society, Hawick, Oct. 8.  
Lauderdale Agricultural Society, Lauder, Oct. 8.  
Brampton Cattle Show, Brampton, October 30.  
Chippenham Cattle Show, Chippenham, December 11th.  
Smithfield Club, Dec. 11.

## BONES.

Since the 5th of September there have passed the SOUND, or by ELSINORE, and the GREAT BELT, 5 ships loaded with Bones, bound for Hull; for other ports of England not known, 1; for Scotland, 1.

DONCASTER.—On Wednesday morning the yearling fillies from Mr. Nowell's stud (Underley, near Kirby Lonsdale) were sold by auction, and knocked down at the following prices:—

|                                                                    | gs. |

| Novelty, by Blacklock .....                                       | 150 |
| Bay mare, by Capt. Candid, out of Pauline—stinted to Langar ..... | 47  |
| Mr. Watt's Mamel Otz, by Blacklock .....                          | 86  |

Lord Chesterfield has purchased Hornsea for 1,700 guineas.

Mr. Gully has sold Margrave, to go abroad.

Lord Lichfield has recently purchased Brother to Stockport and El Pastor of Mr. Greville.

## LIVERPOOL, August 31, 1835.

Waiting upon you, as usual, with our monthly report of the Corn trade, we have esteemed the present month a proper period for extending the scale of imports to a series of years, and have, accordingly, given in the following table the annual importation of each article of the trade, taking the 12 months ending 31st August, 1829, as the first of the series. In it is also shown the value of each description of free Grain, &c. at the several periods, assuming for the standard the price of Irish produce, which constitutes the great bulk of our supplies.

The most striking features exhibited by the above statement, are, the continued and not inconsiderable

reduction, which, during the last three years, has been going on in the supplies, and, the decline which has at the same time taken place in prices of the leading articles of consumption. Of the former it will be noticed that for the season ending August, 1833, the deliveries of Wheat were 460,000 quarters, last year they were 394,000, and this only 297,000 quarters; of Oats there were imported in 1833, 368,000, in 1834, 312,000, and this year 228,000 quarters; nor on reference to the manufactured articles, Flour and Oatmeal, do we find any increase to account for the falling off in the supplies of the raw material. It is perhaps out of our province to endeavour to assign the cause of this great reduction, but it may be proper to remark that the superabundant growth of Wheat in this country has, by keeping the interior markets constantly supplied, so curtailed the sale of Irish produce that we have never, throughout the season, been able to force a trade beyond the immediate neighbourhood, and our granary stocks of free Wheat are still upwards of 130,000 quarters. Those of Oats amount to a mere trifle, which is also the case as regards almost every other article of the trade. At the close of August, 1833, Irish Wheat was considered unusually low at 7s 10d per 70lbs, at the same period of 1834 it was reduced to 5s 9d, and at this moment the best samples of last year's growth would not exceed 5s 6d per 70lbs.

## MONTHLY REPORT OF THE WOOLLEN TRADE.

LEEDS, Sept. 1.—In our last month's report we hazarded the opinion that the autumn trade would be good; and so far as the transactions of August may be considered a fair criterion of what the ensuing months of the season are likely to be, that opinion has been verified. As proofs, we may state, that notwithstanding the occurrence of two or three very flat markets, the purchases in the Cloth Halls have been extensive; whilst the mills in and around Leeds have been well employed. The stock of balk goods in the Halls is low, and it would be still lower if a considerable portion of it were not unsuitable to the tastes of the merchants,—its unsuitableness arising mainly from the circumstance of its being fabricated from the lean and poor wools, which constitute almost the only choice for the clothier in the months immediately preceding the clip. The influx of buyers of finished goods has been quite an average one for August, though the purchases made by some of them have not been on so large a scale as usual. We allude to the wholesale buyers, and of them, principally to the larger London houses. Their comparatively limited purchasers are, however, to be accounted for, without supposing that they are jealous of the state of trade generally, or apprehensive of any immediate or serious change in prices. The key to their conduct is to be found partly in the increasing resort of the retail buyers to this market,—partly in the deficient assortment of winter goods,—and partly in the general adoption, by all classes of buyers, of a very cautious system of buying, ever since the price of wool rose to its present high level. The extent of purchases is, besides, greatly curtailed, in consequence of the merchants in general holding smaller stocks than was the practice before the rise; their policy in so doing being obviously akin, in its motive and object, to that of the buyers, viz. to be prepared for a fall of prices, and to be able to command a profit, by keeping the supply of goods within the demand. It must, how-

ever, be owned that, looking at the total amount of transactions for the month, it is not an average one; but we do not thence infer that the autumn sales will be less than usual, because we anticipate, as was the case in the spring, a longer continuance of active demand, and a more equal diffusion of business throughout the four months which constitute the season, than has been common in former years. The slightest consideration of the policy of both buyers and sellers to which we have adverted, will show that this must be the character of the trade,—there being no large accumulations of stock, as were formerly common, and the buyers being of necessity, therefore, obliged to purchase less at once, and to purchase oftener. The whole trade is, in fact, conducted on the system of “hand to mouth,”—and the practice is, under existing circumstances, wise; it is, indeed, the only one that is safe.

In wools, the assortment is good, and in price there is a slight reduction, accompanied by symptoms of greater steadiness. The manufacturers seem to consider the present range of prices more fixed and permanent than they have done for the last eighteen months; whilst the wool dealers appear less prepared or less anxious for a *start* in price, on any appearance of brisk demand. We rejoice at these indications of confidence in one party and sobriety in the other,—because we hold it to be an incontrovertible truth in commerce, that next to a falling market, the most dangerous and hazardous one is that which is unsteady and fluctuating; and of this evil species, we are quite sure the manufacturers have had “*quantum suf.*”—if their good friends, the stables, think so too, it is to be hoped that both will now try to make money together, and not each to enrich themselves by the other's loss.

We have stated, as one indication of a good trade, the diminished stock of balk cloth in the Halls; but this fact is not alone a decisive indication,—it may even be questioned if it be the principle evidence of the state of demand for raw goods, so large is that proportion of the cloth made by the country manufacturers which is delivered to the merchants by order. This mode of transacting business is become so general, and it appears to involve so much benefit to the woollen trade,—as it is alike calculated to improve the art of fabricating woollens, and to foster a more confidential and honourable system of dealing betwixt the clothier and the merchant,—that we shall offer no apology for appending to our month's report some condensed remarks on the system; premising, that as this system is, in most respects, the very opposite of the system of buying and selling in a public market, the superiority of the one over the other will best be exhibited by placing in juxtaposition their respective advantages and disadvantages.

First, as to the system of buying in the Cloth Halls. Its great advantage seems to consist in the ease with which the merchant can inspect a large and varied assortment of goods;—in the absence of any obligation to buy goods, except just when he wants them;—and in the facility and quickness with which he can adapt his offers of price to the alterations of supply and demand. As a reverse side of the picture, it must be acknowledged that the buyer has not a sufficient guarantee for the genuineness and honesty of the article, because the seller in a great many instances regards only the gain of a present transaction, and is comparatively careless about the satisfaction or *proof* which his goods may give to the merchant. Hence a system of manufacturing for show, and not for use, and a corresponding mode of bargaining and chaffering, more resembling, in too many cases, the jockeying of the horse fair, than the fair dealing of the straightforward tradesman. The goods are, in one word, like Peter Pindar's razors—*made to sell*, and if they don't deliver length and width,

why that is the buyer's business, not the seller's. The fault of this state of things must not be laid entirely on the clothier. If he always gives his cloths a little, *only a little*, dew, and a little clean soap, and occasionally a mess of porridge, and if he uses stout tenters to get width, and now and then a good galloway to get length,—he has his excuse—for he knows thumbs are abroad, and eyes are keen; and he calculates the yardwand will drop soon enough: nor is he mistaken, for the chance is about even that he will be beaten, spite of tenters and galloways, dew, and soap. It follows that honest manufacturing will not pay—that dealings are conducted on a vicious and annoying principle of mutual suspicion and fencing; that the character of the manufacture is depreciated, and our credit especially injured in the foreign market.

On the other hand, the system of manufacturing to order, secures to the merchant (provided the manufacturer possess ordinary skill) such goods as he wants, as to weight, width, and colour; such as he can depend upon in the operations subsequent to the completion of the balk article. The goods so produced will be cheaper at the *same price*, weight for weight, and quality for quality, than market cloth; because they are better manufactured; but they will be actually cheaper in price, because steady custom and confidential and honourable dealing, which are necessary elements of the system, will always command the highest skill, and the largest resources. There will also be a reciprocation of knowledge, whereby each party will become more adept in his separate department, and there will be a greater steadiness and safety in their operations, arising out of the comparison and combination of their respective observations and views as to the state of prices and of demand and supply. The disadvantages of the system, consist principally in the obligation of the merchant to take goods in a falling market, at prices above their present value, and *vice versa*, of the manufacturer to deliver goods in a rising market, at less than they cost him. We apprehend when ordinary foresight and prudence are exercised, this disadvantage is of very little moment, and seldom causes any serious loss to either party.

As bearing upon the improvement of the arts of manufacturing and finishing woollens, the latter system has unquestionably the advantage. These two great departments of the trade, although occupied by distinct classes of operators, each ignorant of the other's craft, are parts of a system which can only exist in its perfect form, when the processes of the one are conducted in subordination and with reference to the other. This subordination can have little existence when cloths are made for sale at a public market; it will exist, in a considerable degree, when the merchant and clothier co-operate, so to speak, in the production of the finished article, as under the system of manufacturing to order; it will be the highest when the whole business of fabrication is conducted on a principle, combining perfect skill in the detail of each department, with a comprehensive and profound adaptation of the raw material to its final uses, and of each successive step of the whole art of manufacturing woollens, to all which are to follow, or which have preceded it. The art has for some time been stationary to Yorkshire; at the least, it has not made such decided and palpable progress as would mark the present, as an epoch of great mechanical invention and scientific discovery in the history of the manufacture. This lethargy must not continue. The West is making great efforts to compete with us in middle qualities, and with no mean success; whilst in the original seat of the trade—Flanders—the manufacturers, under the fostering influence of peace, are exerting themselves to wrest the palm of supremacy from the British manufacturer—if, indeed, they have it not already; and the competition of Flemish and French, with British woollens in the foreign market, is close and severe. Are not these reasons weighty enough, and numerous enough to convince our merchants and manufacturers, that they have no mean rivalry to sustain, and no easy task to accomplish? We will venture to tell them, in all friendliness—“they must be up and doing.”

## REVIEW OF THE CORN TRADE IN MARK LANE, DURING THE MONTH OF SEPTEMBER.

The weather throughout the month of August has been wet and unsettled, and though unfavourable to the farmers in the northern districts of England and particularly in Scotland, has yet been highly beneficial to those agriculturists who have been more fortunate in having been enabled to clear their ground at an earlier period. The earth has become *mellowed* and friable, turning up free from heavy clods, and well adapted to receive the seed. Turnips have, however, been too far injured by the drought and caterpillar, to be revived by the genial rains, proving in many places nearly a total failure; and the seed which was sown on the first appearance of change in the weather, requires a mild temperature during the ensuing month to give any hopes of even half a crop being saved; at present the plant is only putting forth its rougher leaves. Potatoes are much complained of, besides being deficient in produce; taking the average growth of the kingdom, the tubers are extremely small in size. The growth of *Trifolium Incarnatum* is fast increasing, and where seed has been sown, which has become habituated to the climate, has turned out tolerably favourable, and will in time become a valuable addition to the farmer; this season it is likely more particularly to prove so, as the second growth of hay has generally failed; and owing to the scarcity of grass, the first crop is being now extensively used for foddering the cattle. In Scotland the complaints are general, as to the injury likely to be sustained from the heavy rains; in the southern districts of the kingdom, wheat is for the most part secured; but in the more northern portions, at least three-fifths of the oats and barley are still outstanding, and in the extreme north, much not even cut. In Ireland the weather has been more favourable, and though the wheat samples are in very many instances damp, the crop is moderately good. Barley is well spoken of, and the cultivation of Chevalier qualities has been much increased. Oats will, it is believed, be found an average growth and the quality fine.

Mark Lane, as well as the leading country markets are very liberally supplied with new samples of wheat, which though they exhibit in some instances fine heavy descriptions of corn, yet generally from the unevenness and disparity of the quality, varying in weight from 54lbs to 65lbs per bushel, afford a corroborative proof of the injury the plant sustained in the month of June from the sudden alteration of the weather; smut also prevails to some extent and the shortness of the yield continues to form the grounds of just apprehension to the farmer, that the produce of the crop estimated from the standing grain has been much over-rated. The deficiency in

the return, as compared with the superabundance of straw will, it is calculated by some, reduce the aggregate growth much below an average, even to the extent of *two millions* of quarters, while on the other hand, others who fully acknowledge the falling off in the produce on thrashing out the sheaves, are yet of opinion, that from the increased number of ears the yield will turn out much nearer an average growth. The fact, as to the probable deficiency of the crop, though it admits of speculative opinion, has had no effect at present on the prices in counteracting their depression, the general averages of the kingdom continuing to decline. The abundance of the previous harvest enabled the farmer in some measure to rally from the paralyzing effect, consequent on the low rates paid for his produce, as he possessed the means of bringing to market an additional quantity of corn in order to realise the amount requisite to meet his disbursements, now however, he is deprived even of this alternative, with the accumulated misery of receiving less for a given quantity, than most of the agriculturists have been ever forced to accept, and as barley and oats turn out a plentiful crop, these articles will recede in price and no longer bear a higher relative value than wheat, as they did last year, affording the grower some chance of recovering the loss he experienced in the depreciated currency of the more staple commodity.

The accumulation of water in the rivers and increase of wind, has, towards the close of the month, caused the trade to rally from the dulness which pervaded it, as the previous inability of the millers to work their mills, had prevented their coming on the market, and in consequence during the early portion of September, a slow heavy sale was experienced at a decline of 3s to 4s per qr; but though the sale was much improved, yet prices have not sustained more than 1s per qr advance on the better descriptions. The distillers have taken off several parcels of wheat, and as the appearance of smut is no detriment to their operations, samples infected with this blight, so fatal to the miller, have thus moved off hand. In some instances however, they have purchased the better descriptions at the top quotations. A few purchases have been made during the month, of wheat for shipment to the northern parts of England, principally to Wakefield. At Liverpool the new wheats at market have been generally of fine quality, and though prices have ruled low and been declining, yet there exists in the minds of many well informed on the subject, a strong conviction that the crops, especially of wheat, will this year prove very inferior both in quality and quantity, to the produce of any of the three last years. With the exception

of the sale of from 2,000 to 3,000 qrs of red Ham-bury wheat at 21s in bond, there have been few transactions in foreign wheat.

The mills having been prevented from working owing to the want of wind and water, has caused the flour trade to remain steady throughout the month; and the receipts coastways having been limited and the trade extremely short of stock, ship's qualities have been saleable at the previous quotations; though it is most probable, that during the current month, the increase of the supplies will depress the quotations.

The receipts of barley throughout the month have continued limited; and as the mildness of the weather has prevented maltsters from coming generally into the market, the trade has ruled dull, until the close of September, when more disposition being evinced to get into stock, the few samples of new quality offering, have moved readily off hand, the finer descriptions of Chevalier realising 1s per qr more money. The new qualities have of late proved more kindly, but though heavy and fine in colour, the samples are not stout, having been deprived by drought of sufficient moisture to swell the kernel, and give that plumpness, which is the characteristic of the better qualities of English barley. The average shipping weight of the article promises to be heavier this season than for many year's past, as 55 lbs per bushel will be by no means an unusual weight in our barley counties for the finest qualities. The few parcels that have been already converted into malt have for the most part worked well. Chevalier descriptions have been sold at 31s to 32s, and latterly 33s and even 34s has been obtained for extra fine sorts. Common runs of malting 30s to 31s, fine 32s; distillers have also purchased, and paid from 28s to 30s per qr the better qualities. Grinding barley has been difficult of disposal; and good old heavy parcels have hung on hand at 24s to 25s. Some purchases have been made in Bond of Danish old samples, principally for shipment to Christiania, to which destination about 3400 qrs have been exported, having found buyers at about 12s to 12s 6d per qr.

As few maltsters have commenced working this season, the trade in malt has been languid; fine qualities realising fully the previous quotations, but inferior sorts being difficult of disposal.

The supply of oats from all parts of the kingdom has been on a very moderate scale, but as dealers and consumers have been anticipating the release of a large quantity of foreign qualities, the business in the early part of August was confined to needy customers, who only purchased from "hand to mouth." The duty on the admission of foreign oats advanced on the 10th ult. to 12s. 3d., and on the 24th to 13s. 9d. per qr., thus precluding further import for the home consumption, and which towards the middle and close of the month produced more steadiness in the market, the extent as to the quantity of foreign oats having been so far ascertained. From the 6th August, the date when the duty on the article declined to 10s. 9d. to the end of the month, only a

small proportion of the stocks was liberated, many speculators having anticipated a further reduction in the duties; however, in consequence of the supplies from Ireland being more liberal than expected, and many of the cargoes being light and inferior, added to the fact of the new qualities appearing at so early a period on the market, and in such excellent condition as to render the article fit for immediate consumption, the trade became depressed, with a limited sale; the averages therefore rapidly declined, and from the 1st to the 10th of September there were entered 102,380 qrs, making an aggregate, which has paid the duty of 10s. 9d. at our port of 124,360 qrs. At Liverpool, 4,300 qrs have been entered; at Bristol 1,680 qrs, and at Hull 10,608 qrs, making a total of 140,948 qrs, and leaving in London in bond, including the arrivals since the advance of the duties, upwards of 79,000 qrs, composed chiefly of good Friesland and heavy qualities for export, besides inferior and stale Swedish, Danish, and Prussian feed. The market, though there has not any briskness been exhibited in it, has continued steady in price, and fine fresh heavy qualities having been scarce, particularly Scotch potato descriptions have realized 6d. to 1s. per qr more money. Foreign feed have obtained low rates, if quite fresh, and even then, have brought rates far from remunerating, most parcels having lost 5s per qr, and many granaried samples, as much as 7s 6d to 10s. Good foreign feed have not been worth more than 20s to 22s. Petersburg, Riga, and Archangel qualities 18s. to 21s.; Danish and Pomeranian old, 17s. to 19s. Those remaining in bond are quite nominal in value, and few offers have been made above 7s to 7s 6d for the better descriptions of feed. Brew are noted at 13s to 15s.

The receipts of new beans have been large, and having exceeded the demand, the article has weekly declined in value, until the reduction amounts to from 5s to 6s. per qr. as compared with the rates obtained at the close of August. Old Beans have been scarce, and sustained little alteration in price. The new qualities are generally dry and handsome. The duty on the article having advanced to 12s. 6d. has prevented any further admission of foreign samples. Longpods have declined 1s per qr., being noted at 31s. to 35s., and Windsor beans have risen 2s. per qr., and are held at from 38s. to 44s.

Few new peas have appeared at market, and as an inquiry has existed for the article, 1s per qr. more money has been obtained for fine descriptions; grey peas advanced, in the early part of the month, 1s per qr., but have again declined to the same amount; Maples have improved 1s per qr. The duties on all articles during the month have advanced: viz., 2s per qr. on Wheat, making the duty 40s 8d; 1s 6d per qr on Barley, the duty being 21s 4d; 3s on Oats, duty now 10s 9d; 1s 6d per qr on Rye, 3s on Beans, leaving the duty 12s 6d, and 4s 3d on Peas, the duty being 18s 3d. Thus the duties on the import of all foreign grain may be now considered prohibitory.

During the month of September, the following quantity of grain and flour has arrived in the port of London:—

|             | Wheat. | Barley. | Malt.    | Oats.  |
|-------------|--------|---------|----------|--------|
|             | qrs.   | qrs.    | qrs.     | qrs.   |
| English ... | 38,381 | 3,029   | ...      | 4,373  |
| Scotch ...  | 74     | 220     | ...      | 1,058  |
| Irish ...   | 35     | 35      | ...      | 34,436 |
| Foreign ... | 1,650  | ...     | ...      | 10,883 |
|             | Beans. | Peas.   | Linseed. | Flour. |
|             | qrs.   | qrs.    | qrs.     | sacks. |
| English ... | 5,402  | 4,293   | ...      | 16,377 |
| Scotch ...  | ...    | ...     | ...      | ...    |
| Irish ...   | ...    | ...     | ...      | 50     |
| Foreign ... | 657    | 2,013   | ...      | 3,665  |
|             |        |         |          | sacks. |
|             |        |         |          | 300    |

In France the harvest is now concluded; and it may be stated generally that wheat, on the middling and inferior soils, will produce better, in many places, than the heavy rich lands, as the straw, which is generally abundant, has been much lodged on these latter descriptions of ground; the quality, however, for the most part, is good, and the quantity exceeds an average return. Rye does not yield in proportion to the sheaves, but is a good crop. Oats vary considerably; where rain has fallen in time, the harvest is productive, but for want of moisture in many districts, the yield will be very moderate, and, on the light and sandy soils, very deficient. Old oats are extremely scarce, and recourse is obliged to be had immediately to the new growth. The first cut of lucerne, clover, and hay has turned out favourable, but the after-growth has partly failed for seed, or been fed off by the cattle, owing to the want of fodder. Prices are ruling low, and as rain has been experienced in most of the departments, flour is becoming cheaper. At Paris, new wheat is coming freely to market, weighing from about 60 to 64 lbs., and obtains from 29s 9d to 34s 6d per qr.; many of the samples are, however, infected with smut. Rye experiences a very limited demand, at 14s 6d to 16s 2d. The supplies of flour are augmented, the mills being enabled more generally to work, by the increase of water in the different rivers. Oats are declining in value, in consequence of the appearance of the new crops at market; but old are still scarce. In the Southern Departments, the appearance of the cholera in some of the principal towns has caused business to become quite stagnant, and prices, at Toulouse and Marseille, are nominal, and the sales confined to the immediate wants.

The Italian markets have become nearly paralyzed in their operations by the virulent breaking out of the cholera; nor are the quotations likely to rally, as the crops of the new quality of wheat are abundant, the stocks of old large, and the shipments from the Black Sea likely to be considerable. In Sicily, the crops being plentiful, quotations range low, wheat being noted at Messina at 25s; barley and beans, at 19s per qr.

At Odessa some speculative sales of soft wheat had been made at 19s 8d, but the opinion prevailed that at the termination of the rainy season, and when the cold weather had rendered the roads passable, that the supplies from the interior would cause a further depression of prices.

The market at St. Petersburg had become firmer, in consequence of the improvement in the price of

Rye meal. Rye was obtaining 25s 8d to 27s. Wheat dull at 32s; foreign qualities are selling at 27s 6d to 30s 8d. Linseed met with less inquiry; Morschansky, however, of best quality, was held at 42s 1d to 42s 9d. The operations of Government have checked the disposition to speculate to any extent, as merchants are again liable to the ruinous results arising to the trade, from having the Government stores forced on the market, which suddenly depress the currency even below a remunerating price. This system, though beneficial to the consumer when prices are high, are deeply injurious and prejudicial to legitimate trade, and has been attended with distressing consequences. At Riga the weather was extremely favourable for securing the crops of linseed, and arrivals of new crushing qualities were shortly expected, prices ruling from 33s 9d to 42s. Hempseed was selling at about 28s. In grain little doing, and rye noted at 22s 8d. Oats as high as 14s. At Danzig the supplies continued moderate, and the trade languid; fine high mixed qualities of 62 lbs, had been bought at 28s, and fine mixed at 25s. The stocks of wheat were reckoned at 260,000 qrs, and the supplies previous to the harvest of 1836, would not, it was calculated, exceed 150,000 qrs. The crop of wheat in the higher parts of Poland were stated as deficient in weight, but in the Prussian provinces, and the adjacent districts of Poland, sound and heavy; smut, however, forms the subject of much complaint. In Mecklenburg wheat and barley were for the most part secured, and though it was calculated the storm at the commencement of the month had destroyed about one-fifth of the produce of wheat, not only in the Duchy, but likewise that of Holstein and the Danish Islands, yet the trade was extremely dull at 22s for wheat; barley, 14s to 15s; oats, 13s to 14s. In Denmark the crops will prove deficient, owing to the loss sustained by the hurricane; prices were in consequence firm, wheat being held at 22s to 23s 6d. Barley was scarce, and old qualities noted as high as 17s, the produce of 1834 being quite exhausted. Peas are a good crop, but oats are expected to yield badly. Rapeseed, both in the Islands, Holstein and Mecklenburg, owing to increased demands from Belgium, Holland and England, added to unfavourable reports of the new sown seed, have advanced prices from 25l 10s to 29l and 30l 5s per last. At Hamburg the Wheat trade was languid; the new parcels of Marks quality proved inferior in quality, and were difficult of disposal, but new Lower Elbe white samples were saleable for local consumption. In barley and oats no alteration; prices of the former remained steady, but of the latter were declining, and noted as low as 9s 6d in the interior. Linseed was saleable at 45s per 416lbs. Cloverseed less animated, though white qualities have been sold as high as 56s 4d per cwt, and red, 40s 2d to 45s 2d. In Holland the new Zealand wheat varies much in quality, though the quantity is satisfactory, and prices were ruling low.

In the United States the prices of flour are gradually receding; Western Canal brands are selling at 28s 1d per barrel, and a few parcels even under that price; Pennsylvanian, 27s to 28s 1d; Richmond City Mills, particular brands, 30s 11d per barrel. Several new samples of wheat have been received at New York, Philadelphia, and Baltimore. North Carolina qualities have been sold at New York at 46s 2d to 46s 6d, which is a decline of fully 2s per qr; other qualities in proportion. Northern oats are held at 25s, with a dull sale. Yellow Indian corn has obtained 36s 8d to 38s 2d; good North Carolina and Maryland, 33s.

## THE FARMER'S MAGAZINE.

### THE IRISH CHURCH BILL.

(From the Herald.)

The principle of the Irish Church Bill, as far as it relates to the confiscation of Church property, was placed in the proper light by the Earl of Haddington, when he showed that it was as capable of being applied to England as to the country in which the experiment of Church spoliation is first to be tried. "What," said the noble lord, "is the principle of the bill? That upon expediency shown you might alienate the property of the Established Church, and apply it to other purposes. That principle was stated in another way, as connected with numbers and confined to particular places; but if their lordships once sanctioned this principle, who could say that the time might not arrive when it would be applied to England also? Might not parishes be found where was a great majority of Dissenters and Roman Catholics, the members of the Established Church being in a minority? Here was a principle ready made to the hands of those who might wish hereafter to take the property of the Church of England. This bill confined the operation of the principle pro hac vice to parishes where there were not above 50 Protestants. What was there magical in that number? Was not the principle as applicable to a larger number than 50? Was it not just as applicable to a parish where there were 100 Protestants, and 4,000 or 5,000 Roman Catholics? This bill promised a surplus which it could not find: but there would be a desire to make a surplus—there would be the same arguments used—the same appeal to the necessity of conciliating the Catholics of Ireland, and extending for that purpose the operation of this bill."

There can be no doubt that lord Haddington rightly prefigured the consequences of passing a bill containing such a principle, under the pretence of conciliating those enemies of the Protestant Church who can never be conciliated by any thing short of its total subversion. The bill is only the first experiment to O'Connellize the Church—the first application of the principle of destruction. It supplies the fulcrum wherewith the lever of Popery may eventually raze the Church from its foundations. If the Lords had once sanctioned the principle, though confined within certain limits in the first instance, the same reasons would be urged hereafter for extending those limits. It would be shown that the Roman Catholics of Ireland were still dissatisfied—that the democrats of this country were still far from being propitiated—that greater sacrifices must be made to prevent those which had already been made from going as nothing—that it was unreasonable and unsound to make confiscation or non-confiscation of church property depend upon the arbitrary number of 50—that, in order effectually to conciliate the enemies of the Church, whether Roman Catholics or infidels, the number ought to extend to 100. That conceded,

the next demand would be to raise it to 200, then 300, and so on, until conciliation reached its last stage, and the final sacrifice demanded of an apostate Protestant legislature was performed to the Popish Baal.

In making any allusion to the debate upon this bill, it would be gross injustice to omit the opportunity of recommending to the particular attention of the Protestants of the empire the admirably reasoned—the truly scriptural and eloquent speech of the Bishop of London. Having widely differed from the learned prelate on another great question of domestic policy, we are not the less ready to bear our testimony, such as it is, to the powerful and splendid manner in which he advocated the cause of the Protestant Reformed faith of Ireland, and exposed the fallacies with which its implacable but crafty assailants endeavoured to co-er the deep-laid design to extinguish for ever the pure light of its altars in the land. Truly did his lordship say, "It seemed to be a peculiarity in Irish legislation that there never was in any of its acts a character of finality. Every thing was to be tried, and each succeeding experiment, like the last, was found to fail. He was wrong, however. In this measure there was a principle of finality—there was a germ of something conclusive—there was the seed of destruction and extermination. He spoke in the fullest conviction of his heart, when he told their lordships that if they were to pass that bill, they might as well embody a clause in it, that in the year 1840, at all events at no distant period, the Protestant Church of Ireland shall for ever cease." If our whig ministers, in that subserviency to the Popish agitators, succeeded in bring that event about, we should like to know how long the union of the two countries would continue?—how long such English proprietors of Irish acres as the duke of Devonshire and the Marquis of Lansdowne would continue to receive the large incomes which they extract from that impoverished country?—how long the forbearance of the descendants of the Milesian chiefs would be exercised before the forfeited estates were reclaimed?

The hopeless folly of attempting to conciliate the Roman Catholic clergy by any sacrifice short of the destruction of the church was well exposed by the Bishop of London. "Observe the Roman Catholic," he said, "from Gandolfi down to McHale, who out-heroded Herod in the virulence and vehemence of his hatred to the Protestant Church. If he and others of the Roman Catholic priesthood had contented themselves with giving expression, he cared not in what terms, to the asperity of their feelings towards the church, they might talk of it as blood-sucking, anti-national, heretical, what they pleased; but they had described it as a badge of conquest and a token of slavery. Well, if it were so, when government should have stripped it of some 800 parishes, would it not still remain as much as a badge of conquest and token of slavery as before? Would it not continue to be so until it was utterly exterminated from

the land? Undoubtedly it would, and the course would be this:—To-morrow a little more of the ornamental foliage (as it would be styled) would be torn from the tree; then there would next be an incision or two in the stem; then the bark would be stripped off, and at the last the enemy would come with the deadly axe to strike at the root, and cast down the trunk and throw it on the fire. Did their lordships then suppose it possible to pacify the Roman Catholics? or if their lordships did, were they, for experiment's sake, prepared to sacrifice on their ambitious altars the holocaust of the Protestant Church? The popish bigots of Ireland have often predicted the approaching downfall of the Protestant Church, and it would seem as if our present ministers were anxious to realize that prediction.

### THE PEERS AND THE COMMONS.

*(From the Morning Post.)*

We repeat that the House of Commons is not the representative of the people, any more than is the House of Lords. The House of Commons is the representative of the Commons. The Commons of England (and the Commons in the original, genuine, and legal signification of the term is a title confined to those, and those only, who have a right to sit, or to vote for representatives, in that estate of the realm)—the Commons of England, like the Peers of England, formed, and still form a favoured section or order of the people, enjoying, for the advantage of the nation in general, certain powers and privileges of a very eminent and exalted character. The number of the commons, like the number of the peers, is purely conventional. The King can increase the number of the peers, and the King, and the peers, and the representatives of the commons, can by convention increase the number of the commons. During the last half century the number of the peers has been greatly increased; and during the last five years the number of the commons has been greatly increased; yet the commons, although far outnumbering the peers, still bear a very small relative proportion to the number of the people. Nevertheless, the commons are so numerous and so scattered that it is not possible for them to assemble together for the purposes of legislation; therefore they meet in the persons of their representatives. There is no other apparent reason why the commons should not in their own persons exercise legislative power. Before the Reform Act they might have met in Spafelds, and now they might meet on Salisbury Plain. It would be possible for all the Commons of England to encamp within five miles of Stonehenge. So much for these two sections or bodies of the people, the Peers and the Commons, alike privileged orders, and alike exercising irresponsible power. And the only material difference between them is, that the qualification of one is purely hereditary, while, in addition to the hereditary qualification which is enjoyed by that portion of the Commons who are landowners, they have also the advantage of a qualification by tenure. If the peers, therefore, in voting for laws, exercise a power for which they are not responsible, so also do the Commons in voting for lawmakers; and if it be a blot in our constitution that the peers should be invested with the function of hereditary legislation, so it must be an equal blot that the Commons should be invested with the function of hereditary election. Thus much in answer to the ignorant fools and superficial knaves who pretend to write now-a-days on political subjects, and criticize, forsooth, our ancient constitution, of the

principles of which, as of everything else, they are absolutely and profoundly ignorant. The constitution of England consists of King, Lords, and Commons; not King, Lords, and people; and the member of the House of Commons who talks of "the people's house," is either a gross blockhead or an insolent usurper.

Now will the people of England be governed by the Commons alone? That is the question which we shall soon be called upon to decide. Will the people of England permit the whole power of the state to be monopolized by one favoured class? For our part we will not trust the Commons of England with despotic power one jot more than the Peers of England or the Monarch of England. The Monarch of England has at times exercised despotic power, and we found it hard enough. The Peers of England have never exercised despotic power, and we hope never will. But the Commons of England have exercised despotic power before this, and, compared with their infamous tyranny, the recollection of the rule of the stoutest tyrant that ever waved in this island a solitary sceptre, is a dream of bliss. Let us not, in God's name, try them again; but, if we are mad enough, the republic of jobbers will not last long. Some brawny arm will soon be extended to "take away this bauble."

### THE MINISTERS.

*(From the Globe.)*

After the scene in the House of Peers on Tuesday night the Tories can scarcely sustain their pretensions to support from the Dissenters of England on the ground of friendship to their cause. A more gross and gratuitous insult, we venture to say has never been offered to that body since the Test and Corporation Acts were first enacted. In a few words we shall make good our assertion.

By law, Dissenters, in their proper persons, are entitled to hold church patronage. Advowsons, by one of those beautiful provisions which tend so much to the advancement of true religion, are a marketable commodity; and a Catholic, Infidel or Heretic, for aught we know to prevent it, a Mahomedan or a Hindoo, can purchase the legal right of presentation to a church living with the same facility he can purchase a bill of exchange. Such persons cannot it is true—and this is the important distinction—themselves enjoy, in any of these religious characters, the fruits of such living. Their power does not extend beyond bestowing it upon a member of the established church, first duly examined and licensed by the dignitaries of the church itself. The presenter of the advowson, be he Dissenter or Infidel, has nothing whatever to do with the training or formation of the clergyman of the church to whom alone it can be given. That individual must be taken ready made, fashioned and formed by the bishop himself, on whom devolves the right to admit or reject applicants for holy orders, according to his own view of their orthodoxy or fitness. Thus rendering it altogether impossible for the Dissenter or any one else, if these functionaries do their duty, and ordain only proper persons to the sacred office, to impose as their presentee an unqualified or unworthy person. With this security and *вето* it is altogether indifferent to the church to whom belong its advowsons, while the professors only of the state religion can reap their benefits. Indeed, when we consider these facts, and remember to have seen Presbyterian chancellors disposing, without remark or objection, the immense church patronage of their office, we

are astonished that Lord Lyndhurst's attempt to revive the hateful and invidious distinctions of the Test and Corporation Acts, and to exclude from the exercise of corporation church patronage dissenting councillors, was not met and put down, even in the House of Lords, with one universal hiss of scorn and indignation. But no! the Peers, the Tories, "the best friends of religious liberty," declare that the sole connection Dissenters shall be permitted to hold with the church is to contribute their means to its support. Is it not, then, true, as we have said, that the Lyndhurst insult to the Dissenters of England is as gross as it gratuitous?

### COUNTY RATES.

(From the *Mark Lane Express*.)

We stated last week that the appropriation of £110,000 in aid of the county rates was the only measure during the present session which could afford the slightest relief to the agriculturists. The increase of the county rates during the last few years has been so rapid as to become excessively burdensome, and forms a very considerable item in the poor-rates of every parish. A commission was formed by Lord Duncannon during Lord Melbourne's first administration to enquire into the county rates and other matters connected therewith. From the first report made by the commission, it appears that the vast increase in the county rates may be ascribed in a great measure to the costs of prosecutions which have been gradually increasing during the last forty years. It not only appears that the cost of each individual prosecution has increased, but also that the number of prosecutions has increased in a much more rapid ratio than the advance of the population. In the West Riding of Yorkshire, the sum expended in prosecutions in 1814 was 2,823*l.* 14*s.*, in 1824 10,500*l.*, and in 1834, 13,727*l.* The expenses of assize prosecutions vary from 15*l.* to 50*l.* in different counties, but the average seems to be about 19*l.* each, whilst the cost of quarter sessions prosecutions varies from 3*l.* to 13*l.*, and averages about 7*l.* 10*s.* each. In examining the items of which the charges for prosecutions is composed, it seems that the cost of carrying witnesses to the place of trial, with the loss of time, maintenance, and expenses there, form by far the largest portion of the expenditure. In those towns which are privileged to try ordinary offences, but which send the capital offences to be tried at the assizes, it appears that a prosecution of the former class costs upon an average about 5*l.* 8*s.* 6*d.*, and one of the latter about 19*l.* The same difference may be noticed between trials at the ordinary quarter sessions, and those which are disposed of at adjourned sessions held in different large towns. Thus, a prosecution at Sheffield costs but 4*l.* 4*s.*, which at Pontefract would average nearly 10*l.* Without going further into the details of the evidence produced before the commissioners, it is abundantly clear that the holding of courts in different places so as to preclude the necessity of convey-

ing witnesses a long distance, and maintaining them for some days, would materially decrease the amount of the county rate, and moreover possesses this advantage, that it may be carried into effect without delay or difficulty. This would naturally bring us to the consideration of a question which has already been much discussed, but which has with many other measures of practical utility been overlooked amid the contention and turmoil of the present session, we mean the establishment of local courts. However they may differ in the details, the leading legal luminaries of both political parties are agreed upon the principle, Lord Lyndhurst having announced when in office, his intention of bringing in a Bill for their establishment, and we have no doubt that when the knotty points of Church and Corporation Reform are settled, the establishment of local courts will be amongst one of the first measures. The commissioners upon the county rates advert to the subject, and it is suggested in the report that an ambulatory judge of criminal jurisdiction should be sent round to hold a court in every large town for the trial of such offences as now come under the jurisdiction of the sessions. So far as regards holding courts in such places, and upon more frequent occasions, we entirely concur, but it seems to us that the cost of a judge's salary, even though it were not paid out of the county rate, would, in a great measure neutralize the pecuniary advantage which might be derived from the adoption of the proposed plan. Admitting the present mode of conducting business at sessions to be satisfactory, we see no difficulty in making such arrangements as would enable the magistrates to hold sessions in any number of places which the circumstances of the particular case might require. On the moral advantages which must result from the holding frequent sessions, it is almost unnecessary to dilate. The evil consequences of mixing with the usual inmates of a goal, more especially to juvenile offenders, are too little considered by those whose duty it is to superintend the public morals. The magistrates, most of them country gentlemen deeply interested in the social condition of the people by whom they are surrounded, have it in their power, without any additional legislation, to lighten much the burthen of the county rates, and at the same time to check the contamination which uniformly affects the mind even of the adult who has, although for a short time, been compelled to associate with the usual occupants of a prison.

### THE POOR LAWS.

(From the *Globe*.)

Major Beauclerk, it appears, asked Lord J. Russell on Monday "if he was aware that orders had been issued by the poor law commissioners to stop all out-door relief in the present season. Such orders had come down to Sussex three days ago, to a place where he (Major Beauclerk) was stopping at

the time. He dined in that neighbourhood on Sunday last with a clergyman, and met on that occasion a large body of magistrates. They were all guardians of the poor, and all friendly to the bill; but they were all against enforcing such orders at this season of the year. Their universal opinion was, that the enforcement of such orders would spread misery and want in the agricultural districts, and that the old, the sick, and the infirm, had not anticipated such a thing, and who had laid by nothing to meet such an emergency, would be consigned to starvation."

This passage is from the report as repeated in the *Times* of this morning. In the first place we would observe that it is an untrue representation, that to withdraw any portion of out-door relief is to consign any paupers to starvation: as such withdrawal is invariably coupled with an offer of the workhouse.

What, however, will the public think of the character of the attacks upon the measure, when we assure them that having made inquiries upon the subject, we find that no orders whatsoever connected with the out-door relief had been sent down to Sussex three days ago, and that no orders "for stopping all out-door relief in the present season" are in operation in Sussex, or have at any time been issued by the commissioners to that county! We doubt the truth of the report. We shall not believe, until we see it confirmed by himself, that Major Beauclerk, virulent enemy as he was to the poor law amendment bill, and strongly disposed as he doubtless is to justify his former opposition, made the statements attributed to him.

On the same night on which he spoke, several members of the same order got up and made complaints with respect to the proceedings under the act—complaints involving mis-statements almost as gross; every one of which was answered, as it were, by anticipation in the report delivered to the hon. members on the very morning of the day on which they made their speeches. One hon. member, for example, is reported to have disclaimed against an union of agricultural parishes with the city of Gloucester, and the tyranny of the commissioners in forcing parishes which were lightly burdened to contribute to the burdens of the more heavily burdened. Now, if the hon. member had read the act, he would have seen that the commissioners have no power whatever to do the tyrannous things imputed to them, or to equalize the parochial burdens in the manner stated.

#### THE MUNICIPAL CORPORATION BILL.

(From the *Times*.)

Having ourselves already expressed with entire frankness our respect for the temperate and conciliatory spirit which had appeared to actuate the House of Commons in the latter stages of their proceedings upon this bill, that is to say, after it had been returned to them from the Lords, with all its amendments on its back, we with equal readiness renew our approbation of the discreet promptitude manifested by the representatives of the people on the receipt of the lords' *ultimatum* yesterday, when the bill, as amended, was accepted by them as a preferable alternative to that of leaving the old corporations altogether untouched, and the whole mass of acknowledged municipal grievances in full force for an undefined duration.

Nor can we let the occasion pass without calling to public notice for an instant the admirable wisdom with which the usages and regulations of our legislative bodies, whether as regards their separate transactions, or their intercourse with, and

operation upon, each other, have been contrived by our cautious and clear-sighted ancestors, for the avoidance of precipitancy, the defeat of passion, and the eventual triumph of reason and judgment over all the obstacles to sound legislation, interposed by prejudice, impetuosity, and partial and one-sided views of public questions. The repeated readings, the committals, the recommittals, the conferences, the successive opportunities thus afforded for considering measures both in principle and detail, under every imaginable shape and aspect for men of practice, men of theory, men with personal and conflicting interests on all sides to set the flail to work vigorously and skilfully, to thrash out the substance from the husk, and ascertain by frequent examination what ought to be kept and what delivered over to the winds; these are portions of our constitutional machinery little thought of in ordinary times, but at all times of inestimable value, and never susceptible of an illustration more gratifying or more striking than that which they have received from the complex discussions and various intercommunications between the houses to which this most important and most beneficial bill has given rise, while from them we trust, and are conscientiously satisfied, it has gained the most solid improvements.

One extraordinary advantage which has arisen from the comparatively long period during which the bill from first to last has been before one or other of the houses of parliament, has been the gradual evaporation of violence and progressive increase of calmness and good temper so observable in both houses as the deliberations went on. The earlier debates in both were of a somewhat menacing and acrimonious character, which disappeared with the continuance of discussion. The last, which took place in each house respectively, was, on the part of the chiefs on both sides, a model of moderation and senatorial temper, and the once alarming scene has closed in cheerfulness and peace.

Lord John Russell, we see—but it neither surprises nor at all offends us—felt himself under the necessity, good-humouredly hinted at by Sir Robert Peel in his speech on the 24th ult., of articulating a "hard word or two," just to smooth down the rising bristles of some of his ultra-Radical supporters. His lordship talked of his conviction that the bill could not be regarded as a "final measure." His lordship, of course, did not mean to stir up with one hand those embers of disagreement which, with the other, he had just been so laudably extinguishing; and therefore we shall say no more than that it will be the part of prudence as well as patriotism in those who are charged with the maintenance of the public peace, to abstain from pledging themselves so long beforehand to the incompleteness of an experimental measure, but rather to watch its workings, and be determined by the results of an experience which does not yet exist, in pronouncing whether it shall hereafter be considered to fulfil or disappoint those hopes of public benefit, on the strength of which it has so recently won its way through parliament. In our opinion, without at all pretending to affirm that the bill is perfect, it would *not* be wise to meddle with its provisions (at least with any of the more important ones) until after a full and attentive trial of their efficacy. The measure must be tested in all its parts, before it can be safely wrought upon in any, if we wish to be secure of the harmonious adjustments of our alterations to those portions of the frame which shall be left un-

altered. In the mean time let us congratulate the country that the law has passed—and we pray that those who come after us may have reason to add —“*sit perpetua.*” And let us not forget, that the bill owes many of its best qualities—those qualities which can alone ensure its permanency—to the House of Lords, who, under the guidance of Lord Lyndhurst, purged it of its unconstitutional matter, and controlled its original recklessness by the limits of law and reason.

### THE LAST SESSION.

(From the Herald.)

No session of parliament probably ever began, progressed, or ended, in a manner so little satisfactory to the country as that which has just terminated. The factious dismissal of the Speaker universally acknowledged to be fitter than any other man to preside over the Commons' debates, gave a sure earnest and foretaste of what the country has since so woefully experienced; of which the subsequent overthrow of Sir Robert Peel's administration left no doubt. The *Standard* has placed the “Is” and “The might have been” in a very obvious and intelligible shape—that of a balance sheet, which we cannot do better than lay before our readers:—

| SIR R. PEELE'S MEASURES FOR 1835. | LORD MELBOURNE'S PERFORMANCES IN 1835. |
|-----------------------------------|----------------------------------------|
| English Church Reform.            |                                        |
| English Tithe Commutation.        |                                        |
| Irish Tithe Commutation.          |                                        |
| Irish Church Reform.              |                                        |

We ask any honest reformer to look on this picture and on that, and then tell us whether the resignation of Sir Robert Peel has not turned out as we foreboded that it would, a great loss and calamity to the country, especially in the cause of Reform? and how it is that those from whom that cause had a right to expect so much, have done so little? We know it will be said (but with what truth?) that the House of Lords have been the obstacle, and that but for them the cause of reform would have been in a more thriving condition. In answer to this, we again request every honest reformer to cast his eye over the above balance sheet, and ask himself how many of Sir Robert Peel's plans of reform have been so much as mooted by his successors, and whether he does not find that only one of them, besides the corporate reform bill, ever so much as found its way to the House of Commons, still less to the House of Lords? In short such a do-nothing session never emanated from a do-little ministry. Even the budget, the principal business of the session, which when out of office the Whigs declared ought never to be postponed beyond the 5th of April, did not make its appearance till the end of August, accompanied by

a silly threat of stopping the supplies, when more than one-half of them were actually expended.

### IMPRISONMENT FOR DEBT.

(From the Herald.)

The good people of Scotland have at all times had the credit of being much more wary, worldly-wise, and prudent than their brethren of the south. This quality they do not seem to have lost, and it extends, as might be expected, to their representatives in parliament, of which we have recent proof in a fact we believe at present but little known—that while in England the harsh laws authorising imprisonment for debt remain in force in all their rigour and deformity, an act was past during the late session, and received the royal assent on the 9th inst., intitled “An Act for abolishing in Scotland [why in Scotland alone?] imprisonment for debts of small amount.” The preamble to this act which is as remarkable for its brevity as its humanity—states that the law commissioners in Scotland “have made a report, from which it appears that great hardship is frequently suffered by poor persons, in consequence of imprisonment for civil debts to a small amount, without producing thereby any adequate benefit to their creditors.” It goes on to enact “That from and after the 1st day of January, 1836, it shall not be lawful to imprison any person or persons on account of any civil debt which shall not exceed the sum of 8l 6s 8d, exclusive of interest and expenses thereon.” There are several other useful clauses in the act, especially one to prohibit the buying up of small debts, so as to render the debtor by their accumulation liable to imprisonment. This then is now the law of Scotland, of one part of the *United Kingdom*—how united, while such discrepancies take place in its legislature, we are at a loss to understand. In a running commentary upon the preamble we have already asked the question which we now repeat, “Why is this the law of Scotland alone?” Why are English small debtors to continue to linger in prison, and suffer what this act justly describes to be “great hardship,” while on the other side of the Tweed such hardship has thus ceased by law to exist? Where were our English representatives—where the metropolitan and other borough members—where our professing patriots and spouters of humanity at Exeter Hall—when this humane law is allowed to pass for one part of the empire, while the other is excluded from it? Where, may we not ask, were the noble persons who have during the whole session been paying such laborious attention to prison discipline, when they let pass this opportunity of doing for England what its representatives have done for Scotland, and by so doing unload our gaols, especially those of the metropolis, of a host of their most pitiable inmates? Can any of the persons we have alluded to be ignorant of the number of persons annually incarcerated for debts less than one-half, nay one quarter, of the minimum named in this act? If they are, let them inquire in Whitecross-street, the Borough Compter, or any of the many other receptacles of wretchedness, and they will there learn that more persons are in one year imprisoned on judgments from our Small Debt Courts alone than are incarcerated in all Scotland for debts of all amounts in five. Have not, then, the people of England, we repeat, ample reason to complain of the supineness of their representatives, especially of those who, with humanity and patriotism constantly on their lips, let pass the best opportunities of reducing their professions to practice?

MR. O'CONNELL.

*(From the Standard.)*

We confess unfeigned pleasure in witnessing the commencement of Mr. O'Connell's agitation circuit. It is a fine commentary upon the good old English proverb, "hungry dogs eat dirty pudding," which the respectable people of England of all classes will know how to apply to those persons who are willing to hold office under this person's patronage. Of the public character of the man—with his private history we have nothing to do, though we are entitled to say that we have never heard any traits of generosity, or tenderness, or fidelity in friendship, in his private practice, to compensate his public crimes—of the public character of the man, it is perfectly impossible to speak in terms adequately expressive of the disgust and indignation which it ought to provoke. History and fiction have been in vain ransacked to find his parallel. Catiline has been spoken of; but Catiline was accomplished and brave, and if rapacious, he was not a niggard. The *alieni appetens* was qualified by the *sui profusus*. Thersites has been named; but we do not find that the vices of Thersites were otherwise than disinterested. Catiline and Thersites in one, could their characters be reconciled, would be libelled in a comparison with Mr. Daniel O'Connell. There is no opinion, and we repeat it advisedly, which this man has ever pronounced, that he has not, upon the slightest temptation of advantage, retracted and reversed. Take, for example, the case of the 40s freeholders in Ireland. In 1825, after having lived, as he tells us, 50 years among these 40s freeholders, Mr. O'Connell did upon his oath declare that "they ought to be disfranchised, because persons in their rank of life could not be free agents." At Manchester, the other day, this person appeared the advocate of "universal suffrage."

We speak not of his *chasse-ing* upon the poor law question, or upon the question of the "repeal of the union," though his eternal shuffling upon both is matter of notoriety. We speak not of these, because upon matter of mere speculation it is lawful, and it may be honourable to change one's opinion; but in the case of the elective franchise, the assertion of 1825 was an assertion of fact—of fact of which Mr. O'Connell must have been cognizant. This assertion then was, consequently, perjury, if his statement at Manchester was not wilful falsehood. Again, there is no class or description of the people upon whom he has not, by turns, hypocritically fawned, and malignantly flung dirt. But three or four years ago, the Orangemen of Ireland, when Mr. O'Connell hoped to entrap them into a treasonable alliance against the British connexion, were, in his professed opinion, the noblest specimens of the human race. They loyally rejected the treacherous advances of the Apostle of Separation, from that forward they became something worse than demons. But we need not pass the sea for an illustration of the traducer's alterations of the foulest slander of the same object whom he does not blush to adulate while it suits his purpose. For 20 years the people of England supplied the butt for all the filthiest shifts in Mr. O'Connell's ribald vocabulary. They were mean, selfish, gluttonous, greedy—stupid, decrepit in body and mind—feeble in their frame—cowards in their temperament, so profligate and so lost to shame, that 19 out of every 20 English women were convicted strumpets before marriage: affording ground for a very charitable surmise as to the virtue of the unconvicted 20th, and as to the married life of all.

And yet this fellow presumes to pass the public ways of England without fear of being spit upon by

every Englishman, and every son of an Englishwoman, who meets him! Nay more, he has the incredible effrontery to pour upon an English assembly the odious slaver of his eulogy. And this is the person, people of England, by whose favour Lord Melbourne and his colleagues exercise the right of governing you, despite of your King—despite of the ancient blood of England—despite of the descendants and the worthy representatives of those who led your fathers to victory at Cressy and Agincourt. This is the person to propitiate whom his miserable slaves would sacrifice a Christian Church, and devote nearly two millions of your Christian fellow-subjects in Ireland to exile, or to massacre—for that is the end of "appropriation," these are the means whereby only the coveted surplus can be created. Here is the champion, then, of the Whig administration—trumpeted by their organs, and acknowledged even by the head of the government himself.

## THE TOWN CLERKS.

*(From the Morning Post.)*

The circumstances under which the House of Lords resigned their amendment on town clerks are not generally known. As the bill was sent up by the Commons the town clerks were only retained during pleasure. Lord Lyndhurst and the peers were prepared to support their original amendment, which retained the services of the town clerks during life; but when the clause establishing aldermen for life was given up, the town clerks expressed their desire to obtain compensation instead of their appointments. A negotiation was immediately commenced during the debate, in consequence of which Lord Melbourne more than once left the house, and communicated with several of the principal town clerks in a neighbouring committee-room. His lordship offered to guarantee them "a most liberal compensation," and the clause for retaining the services of the town clerks for life was given up by the peers at the direct request of those officers.

## ORANGE LODGES.

## GENERAL ORDER.

"Horse Guards, August 31, 1835.

"Lord Hill has reason to apprehend, that the orders prohibiting the introduction of Orange lodges into the army have not been duly communicated to the non-commissioned officers and privates, or, if communicated, that they have not been sufficiently explained and understood.

"His lordship now refers commanding officers of regiments to the confidential circular letters of the 1st of July, 1822, and 14th of November, 1829, upon the foregoing subject; and declares that any officer, non-commissioned officer, or soldier, who shall hereafter institute or countenance an Orange lodge, or any other meeting or society whatsoever for party purposes, in barracks, quarters, or camps, shall be brought to trial before a general court martial for disobedience of orders.

"His lordship, moreover, peremptorily forbids the attendance of either officer or soldier at Orange lodges, by whomsoever or wheresoever held.

"The present order is to be read to the troops periodically on the parade with the articles of war.

"By command of the Right Honourable

"GENERAL LORD HILL,

"Commanding-in-Chief,

"JOHN MACDONALD, Adjutant-General."

## TURF INTELLIGENCE.

During the month which has just passed away, Doncaster has constituted the grand focus of attraction for the frequenters of the Turf, as well as for those who embrace an occasional opportunity of enjoying the elegant recreation which it affords. The St. Leger was this year more than ordinarily attractive, not so much on account of the number as from the extraordinary position of the quadrupedal candidates for this highly important stake, as well as from the circumstance of the meeting being graced with the presence of feminine Royalty. The intention of the Duchess of Kent to honor Doncaster Races with her attendance, in company with the Princess Victoria, was generously and judiciously announced in sufficient time to attract public attention; and, in consequence, one of the most numerous and most brilliant assemblages was drawn together which had ever appeared on a similar occasion. In the company on Monday (Sept. 14th, the day on which the races commenced) was included many of the most distinguished characters in the country; while, on the following day, about one o'clock, the arrival of their Royal Highnesses, above mentioned, was greeted with the most lively pleasure and welcomed by the most respectful attention.

The view which we have uniformly taken of the leading nags and principal favorites for the St. Leger, will be fresh in the recollection of our readers; they will be well aware our argument was to the following effect: that, inasmuch as Mundig had been overmarked in his successful race for the Derby, his chance for the Doncaster St. Leger had completely vanished. Ascot we regarded as the best horse that started for the Derby, and yet it was very evident that he possessed no claim to eminent superiority. Preserve gave the most incontestible proof that she was unable to go one yard with Queen of Trumps, and yet she had proved herself superior to Ascot; therefore, we unhesitatingly and unceasingly maintained, that the Cambrian Queen had nothing to fear except from a dark horse; while, from her acknowledged powers of speed and endurance, it became manifest that none but an extraordinary animal could successfully rival her. Our predictions were verified even to mathematical precision. However, in defiance of common sense and reason, in direct opposition to the self-evident facts above enumerated, Mundig took the lead on the betting list, and was kept in that position by "*The London Sporting Reporter*," frequently in disunion with the operations at Hyde Park Corner, and the betting circles throughout the kingdom. Through the medium of these delusive "*Sporting Reports*" in all the London papers, a false notion is spread through the country, from which there cannot fail to result the most erroneous calculations, the most unsatisfactory, if not ruinous, conclusions. As soon might we expect a crop of red clover in Blackfriars Road as reasonable probability from the elegantly fugacious pen of "*The London Sporting Reporter*." A person who possesses exactly that well-balanced modicum of sagacity to distinguish a horse from an elephant, is but ill-calculated to teach or illustrate the doctrine of progressive motion. However, "*The London Sporting Reporter*" can lay unqualified claim to the merit of playful imagination, if not to extraordinary genius,

as his contrivance for the removal of General Chasse from Liverpool to Goodwood by steam, and other extraordinary inventions, sufficiently testify.

On Thursday, Sept. 10, the betting circle became conscious that they had acted under the most flimsy and inconsiderate delusion, and Her Majesty rose to that brilliant distinction to which she had been pre-eminently entitled from the moment she reached the winning post for the Oaks: on arriving at Doncaster, they became further enlightened on the subject; they found this splendid filly freely backed at 2 to 1 the field against her. Further, Hornsea, a dark horse, had crept into favour, as will be seen by the adjoining list, while Ascot had made that sort of decided retrocession which clearly indicated the opinion entertained of him by those who were acquainted with the true state of affairs; and Mundig was scarcely recognised or acknowledged in the betting. The following was the state of the odds immediately before starting:—

|      |    |   |      |                 |
|------|----|---|------|-----------------|
| 11   | to | 8 | agst | Queen of Trumps |
| 7    | —  | 1 | —    | Preserve        |
| 12   | —  | 1 | —    | Hornsea         |
| 12   | —  | 1 | —    | Jupiter         |
| 12   | —  | 1 | —    | Ascot           |
| 25   | —  | 1 | —    | Brother to Hope |
| 33   | —  | 1 | —    | Trim            |
| 40   | —  | 1 | —    | Mamsel Otz      |
| 40   | —  | 1 | —    | Turban          |
| 1900 | —  | 1 | —    | Mundig          |

Tuesday, the 15th, was ushered in by heavy rain, which ceased, however, as the time of starting for the Leger approached, and recommenced as soon as this important stake was decided.

Mundig and Hornsea were in the hands of the same trainer (Scott), and in all probability the former was started to make play for the latter, which, however, he was utterly unable to effect. Mundig gave up in good time, reserving himself for the following day, when he won the foal stakes, having only three very inferior horses against him.

The following ran for the St. Leger:—

|                                    |       |    |
|------------------------------------|-------|----|
| Mr. Mostyn's Queen of Trumps ..... | (Lye) | 1  |
| Mr. Richardson's Hornsea .....     |       | 2  |
| Mr. Golden's Brother to Hope ..... |       | 3  |
| Mr. Greville's Preserve .....      |       | 4  |
| Lord Orford's Ascot .....          |       | 5  |
| Mr. Powlett's c by Langar .....    |       | 6  |
| Mr. Houldsworth's Turban .....     |       | 7  |
| Mr. Johnson's Jupiter .....        |       | 8  |
| Mr. Bowes's Mundig .....           |       | 9  |
| Mr. Watt's Mamsel Otz .....        |       | 10 |
| Mr. J. Peel's Trim .....           |       | 11 |

At starting, Tommy Lye and the Cambrian Queen got locked in the middle, but confidence smiled upon the countenance of the venerable little jockey—he well knew he could win. Powlett's colt jumped off at a rattling pace, with Jupiter, Turban, Mamsel Otz, Ascot, and Preserve, clustered at his heels, Queen of Trumps in the centre, followed by Brother to Hope, Hornsea, and Mundig. The pace was good, and no sooner had they got over the hill than it became evident Mamsel Otz and Jupiter had lost all chance of success; Trim shortly afterwards declined, while Brother to Hope and Hornsea advanced towards the front, and the latter took the lead—the Queen all the time going quite within herself. At length, Her Majesty collared Hornsea, something

more than a distance from home, played with him for a few seconds, and cantered in with as much ease as she did for the Oaks on Epsom Downs; thus winning the Oaks and the St. Leger, a feat never before accomplished.

The St. Leger Stakes amounted to £1,800: the race was run in three minutes and twenty seconds.

Queen of Trumps is by Velocipede, out of Prince's Royal, by Castrel, out of Queen of Diamonds, by Diamond, her dam by Sir Peter, out of Lucy, by Florizel, out of Frenzy, by Eclipse, her dam by Engineer, Lass of the Mill by Traveller, Miss Makeless, &c.

PERFORMANCES OF QUEEN OF TRUMPS.—1834. Won the Champagne Stakes at Holywell Hunt, beating Sir T. Stanley's Peter Simple, Sir R. Bulkeley's Borghese, and Mr. Price's The Juggler, very easily. 1835. Won the Oaks at Epsom, beating Mr. Greville's Preserve, Lord Orford's Bodice, and seven others, in a canter. Won the Knowsley Dinner Stakes, at Liverpool, beating Mr. Houldsworth's Hectic, Mr. Turner's Equator, and Lord Westminster's b c by Conductor, out of Bertha. Won the St. Leger, at Doncaster, but lost her race for the Scarborough Stakes owing to extra weight and accident.

She is a dark brown, with three out of the four legs white; a white star and stripe down the face. She has what is termed in Yorkshire the Blacklock head; her cheeks large, but tapering small towards the mouth; her neck is very light, the head well set on; her shoulders strong and oblique; expansive chest, with fine arms and good legs; rather hog-backed; very sweeping quarters; her thighs muscular and long, very short from the hock to the ground. When extended, her action, particularly that of her hind quarters, is of the finest description; added to which, she possesses an excellent temper.

Considerable anxiety was manifested on Thursday previous to Doncaster Races, by the betting circle, to make up their books; but, as the *mistified* deception had been dissipated, this was found impossible of accomplishment to the desired extent, and some of the regular Turfites have become losers to a tolerable extent in consequence. The Manchester and Liverpool betting men were winners to a considerable amount, and would have backed Queen of Trumps to a much greater extent, had it not been for the fictitious "*Sporting Reports of the London Papers*." Some money has also been won by a few choice spirits of the good old city of Chester. Several gentlemen from the metropolis stood heavily on the Queen, and have therefore won large sums. Her owner, Mr. Mostyn, is, like Mr. Batson, a breeder of racers, and much attached to the Turf, but never bets heavily; and though on the present occasion, he must have felt the utmost confidence of success, his betting book contained no heavy sums.

The estimation of Velocipede as a stallion, will be much enhanced by the pre-eminent success of his daughter. Velocipede was every inch a racer, though inclined to "speedy cutting;" we saw him run his most severe, (and, we believe, his last) race, when the Liverpool Cup was awarded to him, though the decision of the judge was unhesitatingly called in question—the *balance of a betting-book might cause defective sight*. Though a successful racer, Velocipede left the course at an early period of life, in consequence of "going all to pieces before."

The Turf may boast of having, at the present moment, the best colt and filly, perhaps, that ever

appeared, namely, Plenipo and Queen of Trumps; a race between the two would be interesting in the highest degree. What stock might not be reasonably anticipated from them, possessing as they do, not only the finest forms, but the most robust constitutions, if they came together before severe work or age, or both, had reduced their vigor!

The following specimen of "sublime and beautiful" ignorance has made the round of the papers, furnished by "the Gentleman who reports for the London press:" Speaking of the race for the Scarborough Stakes, he observes:—"The General took the lead, followed by Ainderby, the mare, who had an indifferent start, lying about two lengths behind him; in this order they ran till about half way between the gravel-road and the distance, where they closed, and travelled in company half way up the distance; here the General was beaten and the others left together, *the mare, perhaps, a trifle in advance*; at this moment a dog rushed from the opposite side of the course almost under the legs of the mare, who had the whip band; *she flinched and changed her leg, but that she lost any ground by it, we will not take upon ourselves to assert!!*" It is not possible that such an assertion could have been advanced by any person who possessed the most trifling knowledge of the operations of the Turf! Here, however, it is pushed forward with the most presumptuous and the most unblushing ignorance, that, though from a dog rushing at her, Queen of Trumps *swerved, and changed her leg*, she lost no ground by it! What may we not expect after this? The most wretched noodle in such matters is very well aware that the Cambrian Queen could not lose less than twenty yards by it, while leading with the wrong leg must necessarily have the effect of reducing her speed at least one mile in four. He thus accounts for the defeat of the Queen: "The mare had not taken a *gallop* since the St. Leger!" From which it is evident, he is utterly unacquainted with the meaning of a *gallop* in the sense in which it is understood by trainers. A *gallop*, indeed! what an egregious simpleton!

The following is the state of the case. In the first place, let it be borne in mind, that for winning the St. Leger, Queen of Trumps had 71b extra placed on her back; and that as 51b extra is calculated to be equal to a distance (240 yards), 71b on the back of a three-years old would be nearly equal to double that length. Yet, under such an overwhelming disadvantage, the filly in question had beaten off one opponent, and was fast leaving the other, when a dog flies at her (we hope not intentionally placed for the purpose?) she swerves (or "*flinches*," according to the literary didactics of the *Sporting Reporter*) changes her leg, but, nevertheless, runs her antagonist to half a head! Nothing can be more ignorantly preposterous than to talk about the defeat of the Queen in the manner of the "*Sporting Reporter*." Further, that those who understand Turf affairs entertained a similar opinion of the powers of the Queen of Trumps as that which we have expressed, is evident from the circumstance of her being allowed, *the same day*, to walk over the course for the Three-Years-Old Stakes.

It is lamentable, that the London papers are unwittingly lending themselves to a system of quackery so calculated to mislead, and altogether so contemptible!

### POOR LAW AMENDMENT BILL.

Let us appear nor rash nor diffident;—ADDISON.

TO THE EDITOR OF THE FARMER'S MAGAZINE.

SIR,—From the time of the above bill becoming the law of the land, it has been obvious to every thinking man, that great opposition and difficulty would occur in bringing it into effect, and in the prospect of this opposition and difficulty, the more humane and the wiser part of the community have strenuously urged not only the policy, but also the justice of bringing gradually and with all due consideration for the necessities of the poor, *and those necessities to be admitted from the present circumstances of society, brought about by the abuses which have crept into the late poor law system, and not by the too strict principles of political economy,* those clauses into active operation, which in the hands of hasty and inconsiderate men might be made the instruments of oppression, and consequently the cause of violence and rebellion. To do unto others as we would they should do unto us, is the great and fundamental duty of man towards his fellow men, and I know of no relative situation in society, where this christian principle can more fully distinguish the upright feeling of men in power, or more fully illustrate the grateful minds of those on whom benefits have been conferred, than the present situation of the several boards of guardians throughout the country affords in connection with the applicants for relief at their meetings. That the maxim of doing unto others as we would they should do unto us, may be much perverted in reducing it to active principle, will, I think, be easily admitted, and as it is peculiarly liable to this perversion in the performance of our moral obligations to our poorer brethren, I shall perhaps be excused if I endeavour to explain what I consider to be the real spirit of this axiom in its application, especially to the new work-house system. I have always thought the best test whereby to try the merits of any civil institution to be the law delivered by God himself to his servant Moses, for the regulations of the society of the Jews when they had obtained the promised Lord, and although the vast lapse of time and revolution of men and manners from that period is undoubtedly extreme, still there will not even now be found to exist much difficulty in trying every institution for the well being of society of the present day, *as far as principle is concerned, although certainly not exactly in the letter,* by that divine

ordinance, let us then examine by this test what may fairly be required of us as a duty in respect of extending the means of support to those who have not the means to support themselves, and then let us enquire how far the modern rigid theorist in political economy, and the stern and uncompromising advocate for the work-house test may each fall short in charitable feeling. A deliberative and conscientious mind, may possibly experience some difficulty to satisfy itself in drawing the precise line of boundary in extending relief to those who may require assistance. "To do unto others as we would be done unto," would perhaps at first sight, appear to require of us, to give all our goods to feed the poor; but this is far from being the case, and, if we refer to the original law of God to men, we shall find that when the harvest was to be reaped, the corners of the fields and the gleanings, were to be left to the poor and the stranger.\* This divine mandate must, I think, at once set at rest the nature and extent of the relief required at our hands, and consequently we have only now to consider how this assistance may be charitably administered.

That the workhouse system is the only practicable means of general relief does not appear to me to admit of a doubt. Many humane persons I am aware—led more by their strong feelings, than by their cool judgment—are apt to condemn this "imprisonment of the poor," as it is sometimes styled, as an arbitrary and unnecessary stretch of power, and contend that the same funds applied towards assisting paupers out of the house, would ensure to them equal comforts and far more content. A very little experience in the administration of the poor laws, would have the effect of convincing these good people of their error; and although reluctantly perhaps, they could speedily be induced to acknowledge the melancholy truth which has often been wrung from many a philanthropic theorist, when become practically engaged in poor law matters, viz:—That a degradation of pursuit and taste usually follows the conduct of a man, who will willingly submit to be dependent on the means of others, when by exertion and prudence his own resources would be found to be sufficient for his support, and consequently that he is seldom qualified for, nor entitled to the controul of the fund so raised for his assistance. Now it does not follow because the workhouse plan is by far the best principle of provision for the superfluous and impotent poor, that in every instance directly a pauper becomes chargeable, he should be hurried off

\* Leviticus, chap. 23, v. 22.

to the workhouse without consideration of the particular circumstances of the particular case; but I do think the extending of out-door relief should be the exception only, and that rather cause should be shown why a pauper should not be sent to the workhouse, than that any reason should be given why he should be sent, beyond the fact of the application for relief.

A person inclined to dispute this principle I am aware might easily instance many cases of hardship, which will necessarily occur in carrying it into effect. However, if good order and a due respect for property is to be maintained, the workhouse system must be the foundation stone of the future relief to the poor, and the foundation being so constructed, a due regard must be paid to humanity and discretion in the application of all new rules, to the very turret stone of the edifice. How far these attributes have shown themselves in the adoption of the dietary tables at some of the new workhouses, is in my mind at least a questionable matter, and I believe I could mention an union where a dietary table has been applied, so insufficient on the face of it, that many of the guardians of this board would not attempt to defend it, or to incur the responsibility of acknowledging it as any act of their own, but would rather be inclined to compromise the matter with themselves, under the assurance that it must be sufficient, because it was sent to them from the workhouse of St. George's, Hanover Square, where it had undergone a test of some months. Now I have no hesitation in saying, if I was a member of a board of Guardians, and the dietary table from St. George's, Hanover Square, was submitted to me for my signature, with the intimation that it was to be applied in the case of all paupers who owed their introduction into the house from habits of dissipation and idleness, that I would immediately sign it as a provision exactly suited to the willing and vicious pauper; but on the other hand, if I found it was to be used in the case of the afflicted and unfortunate—the pauper from circumstance, and not from misconduct or from a degraded choice—I could not have been a party to have dealt a like hard measure to the one that I would willingly have inflicted on the other. It may be said the difficulty of distinguishing between the paupers in the same establishment, in reference to their diet, would be so great as to render it quite impracticable to attempt. I will admit it would occasion a great deal of trouble, and that it would require no trifling share of discretion on the part of the person authorized to decide which of the inmates might be entitled to partake of the *plain, but substantial and wholesome provision* made for the poor and impotent; and which of the inmates should be condemned to the coarser food, provided for the idle, the profligate, and the vicious; but at the same time I deny that it is impossible to effect this object, so obviously desirable and just.

Here I quite anticipate the answer of the rigid political economist—in fact here applies especially the drift of Lord Brougham's doctrine, laid down in his famous speech on the Poor Law Amendment Bill, and which principles the reader will find reiterated in Miss Martineau's tale of 'Cousin Marshall,' to the effect that if too much comfort and consideration of the feelings be extended to the pauper part of the community, we shall in a few years become a nation of paupers. I will here take the liberty to recommend to every person at all interested in the present state of society, as regards the Poor Laws, to read the pamphlet of Miss Mar-

tineau's, which I have mentioned above; and although the errors and dangers of the old system are there truly and forcibly illustrated, I confess nothing therein contained, nor anything I have read, seen, or heard elsewhere, would prevent me—had I the power of doing so—allowing a small quantity of tea to the old women, and an occasional mug of fresh beer to the old men; and neither, I hope, would it prevent me supplying generally, to those wants necessarily attendant on the aged, from a due consideration of the feelings of the unfortunate, doomed from circumstances, to a workhouse regimen.

No part of the new workhouse system has excited so much general attention, and at the same time such universal disapprobation as that regulation which separates man and wife. It has been denied by very high authority, that the Poor Law Amendment Bill gives any additional power in this respect; and on the contrary it is said that the power to separate the pauper and his wife was formerly invested in the parish officers. Be this as it may, if the power did formerly exist, it was seldom exerted, and consequently this regulation will naturally enough be attributed to the new law. Therefore let us consider how far it may be applied, and at the same time supported by those *moral laws* which ought always to form part and parcel of every legislative enactment. Those whom God hath joined together let no man put asunder! Now this solemn injunction of our church appears *prima facie* to condemn the proceeding; but I think this injunction will admit of considerable qualification, in partially applying it to any state of society. As for instance in case of transportation of a married felon, it will not I apprehend be thought a breach of any law, divine or moral, to separate under such circumstances, such a man from his wife. It would be a step required for the protection and well being of society, and quite in accordance with those prudent and temperate precautions which are necessary to secure the quiet enjoyment to the well regulated and virtuous part of the community, of those blessings bestowed by an all wise and bountiful Providence. Now the principle which justifies the separation of a felon (in case of transportation,) from his wife is, that he has offended the laws of the society of which he has heretofore been a member, and consequently he has brought down upon himself the violation of that solemn injunction from the altar, "whom God hath joined let no man separate." And thus although in a less degree does the *voluntary pauper* offend the laws of society, by omitting either to do all he is able to do, to support those whom he has sworn to cherish, or by committing acts of disorder and dissipation, which have rendered him incapable of the strength and exertion necessary to earn the support of himself and his family, or which in effect amounts to the same thing—the destruction of his character and reputation in the world. Under such circumstances the husband himself is the man who has violated the injunction of the priest, and the law in such case is no more to be questioned than it is in the case of a man who commits felony. But how under other and very different circumstances from the above, the reputation of a man and his wife is to be justified, I am at loss to imagine. The unfortunate poor! paupers from circumstances—from unavoidable circumstances and not from any want of industry or human prudence and foresight. *Many such* truly are not to be found, a *few* such there ever will be, and I

should be sorry to incur the responsibility of being instrumental to destroy, or even to suspend—which indeed it may, in such case be termed—the *holy bond of matrimony*.

Perhaps I may here be charged with being uxorious—the charge falls to the ground, because I am not a married man, but I have other social feelings which revolt at so wicked a proposition. Lord Brougham in the late session of parliament in alluding to this subject, pointed out the propriety of separating man and wife immediately they became inmates of a workhouse on account of the great breach of decency which would otherwise occur from several married couples sleeping in the same apartment, which would be quite unavoidable from the limited accommodation afforded in these establishments, and he then said it had been estimated that it would cost the country a million of money to make arrangements in the different workhouses sufficiently commodious for this purpose. I well know the country is not in a situation to incur an expence of a million, and I also know that we were not in a situation which rendered it a very easy matter to spare the twenty millions which were granted as a compensation to the slave owners, still in this case, the mind of every humane man was so satisfied with the quid pro quo obtained by this grant, that on the whole I think it may fairly be considered to have been a popular proceeding on the part of the House of Commons, and I sincerely believe the present House of Commons would obtain favour with the constituency of the country by taking some decided step on the subject of separating man and wife, which in its present state is a matter of general interest and regret. There is a strong objection made to another part of the new system, which objection I confess I cannot in any degree entertain, namely, the taking away the pauper children, of a certain age, from the parents in order for them to be removed to another establishment, where they are differently fed, decently attired, and well taught. This certainly appears to me to be a very considerate and very wise measure, and although I have constantly heard it condemned, I have never yet heard one valid objection raised against it. It is undoubtedly a severe task for mothers to part with their children, but this sacrifice of feeling is not confined to mothers who happen to be paupers, but it is an exaction of a very general nature, extending from the Queen on the throne to the Queen of the Beggar's Opera. All alike are obliged on occasion, to be separated from their children.

The new arrangements for the medical attendance of the poor appear to me to offer innumerable objections. I have always thought that if the old destructive system of Poor Laws had left one spark of proper feeling in the minds of the poor in connection with their claim for assistance in distress from their richer neighbours, that remaining sentiment was a feeling of gratitude in sickness, for the medical attendance secured to them. Surely the new system of connecting several parishes of many miles in extent, and then letting the medical attendance on the poor of this vast district of country to one medical practitioner—and that too by tender—must and will have the effect of prolonging the sufferings in cases of accident, and embittering the dying days of many an afflicted fellow mortal. If others entertain this apprehension in an equal degree with me, I fervently hope that every influential person in parishes so situated, will see the necessity for watching narrowly that the parish doctor most effectually does his duty,

keeping in mind that his duty is to give sufficient attendance, and to administer sufficient means and antidotes to the occasions of his patients without any reference to the salary which he receives; this is entirely his own business, and heaven forbid the wants of the sick should be neglected because a set of adventurous practitioners have thought proper to engage to do for five pounds a service which is reasonably and fairly worth ten pounds. Since writing the above, I have had an opportunity of looking over the first annual report of the Poor Law Commissioners, which report I promise myself to make the subject of my next letter.—I am Sir, your obedient and very humble servant,  
AGRICULTOR.

Sussex, October 13, 1835.

#### No. IX.

### TO THE EDITOR OF THE FARMER'S MAGAZINE.

SIR,—In your review of the corn trade this week, are some remarks upon the importation of foreign corn; which if I rightly understand, are meant to prove that a duty of 6s 8d per quarter, on wheat, would be a sufficient protection to the British farmer, because that is the average rate of duty which has been paid upon the quantity of Foreign wheat imported under the present corn laws. This argument appears to me fallacious, for it is evident that if the duty had for that period been fixed at 6s 8d, no greater quantity would have been imported in the years between October 1828 and 1832, when there was a scanty crop throughout Europe; but the surplus of Europe imported at a duty of 6s 8d in addition to an abundant crop of our own growth in 1832 would probably at once have reduced the price from 8s the bushel to 5s that year, and to 3s 6d afterwards, which prices would annihilate rent upon lands now let at or under 20s per acre, and make great part of them worth nothing as arable, and but little as pasture, and in that case what is to be done with a large population? Spade husbandry may do in some cases, as where old pasture or superior arable is given up to it, but not on those lands most affected by the opposition of foreigners in the corn market.

I would add another remark upon corn laws which I think will be found correct, that there have been several laws passed at different times either to keep up or keep down the price of corn, which laws have generally had the desired effect for a few years, but ultimately quite the contrary. This I account for that by screwing the farmers down to the lowest possible rate of profit, or rather to a loss in order to get corn cheap, they have been deprived of the power and inclination to grow corn in sufficient quantity; on the other hand the certainty of a market, and a good price calls forth all their energies to raise as much as possible, so that in abundant seasons supply will exceed demand, and the price be lowered to the consumer in proportion. In one case the ruin of a generation of farmers causes corn to be dear, in the other enriching them causes corn to be as low in price as it can be grown, and a plentiful supply of it.

### TO THE EDITOR OF THE FARMER'S MAGAZINE.

For the last two or three years, the statements of the price that a farmer is obliged to give for his malt, appear to me, rather exaggerated. In the midland counties, it is the custom with a large proportion of the respectable farmers not to buy any malt, but to send as much barley as they require for the year to a maltster to be malted, which is done for about 7s or 8s per qr. exclusive of the duty, and that sum the outcast upon good barley will nearly repay to the farmer. When a farmer buys his malt, as is frequently stated at 4s or 5s per

bushel more than the price he gets for his barley, it is not so much the fault of the duty, as because his own poverty or bad management lead him to take one, or perhaps two years' credit for his malt, which, it will be allowed, obliges the maltster in his own defence to put on what appears at first sight an exorbitant profit.

To any farmers who thrash their barley, as many now do before they want the straw for fodder, I would recommend them, from experience, to salt the straw well as they stack it, they will find the advantage, in my opinion, even greater than is derived from salting damaged hay, and the expense but very trifling.—I remain, &c.,

A CONSTANT READER.

## TO THE EDITOR OF THE FARMER'S MAGAZINE.

SIR,—I beg leave to recommend to the notice of preservers of pheasants, (through the medium of your much admired Magazine), the following simple *Poacher Trap*. Besides its novelty, it has other recommendations, namely its simplicity, and unlike other traps, being perfectly humane. The subjoined is a sketch (though I fear a bad one) of the instrument, which may be screwed (A) to any tree in the preserve by which the poachers would probably have to pass; from the Trigger let there be wires or whipcord stretching across the road or footpath, as with an old-fashioned Spring Gun, these being moved will let off a Copper Cap (B), which communicating with a train of powder contained in paper in the barrel or tube (C) will ignite a Russian light,\* (or any other composition which will emit a strong light) hung in a wire basket (D).

By this means the keeper being concealed may discover who are the poachers, (they generally being neighbours), with little risk of being himself detected.

North Wrexham.

\* These lights, which may be easily made or purchased, will throw out a light sufficient to show objects distinctly for 50 yards on either side.

## THE POPPY.

Mr. Editor,—Amongst the thousand and one tourists who have pestered the public with what they paid for in the eating way, and with what were the remarks of Miss Matilda or Master Jackey, or the more recondite reminiscences of the discontented cynic who started with a determination to be displeased with all that was French, I have never seen in print any thing said about the poppy, of which thousands of acres are cultivated all over French Flanders for the oil, of which vast quantities are used for the table even in Paris, and much burnt in lamps, and why not in painting? As an eating oil it far exceeds many of the Italian oils in flavour, and colour being quite limpid. Now, Sir, I think it might be cultivated with profit and success in the present depressed state of agriculture. It would be sure of a ready market. As gallipoli oil is imported in large quantities for our manufactures and other uses, it might likewise be used in the finer kind of soaps, and even opium may be extracted from it. I remember seeing it cultivated for that purpose at a place near to Leith walk, in a large garden famous for strawberries and cream, well known to the inhabitants of modern Athens. The mode of collecting is this:—children, boys and girls, are employed, two take a row, one makes an incision across the poppy head with a small sharp knife, while another follows with a small tin cannister similar to that in which gunpowder is sent from the manufacturers, which is suspended by a string so as to hang on his breast, and leave both hands at liberty, with his left he holds the poppy head, with his thumb he takes off the tear that has exuded from the wound, and scrapes it off on the edge of the cannister, and so on to another. I believe the quantum of a day's work is a pint. It is afterwards dried in the sun if sufficiently hot for that purpose, if not, gradually by artificial means. I have no doubt the worthy President of the Horticultural Society could and would by means of his numerous correspondents, throw a greater light upon the subject, so as to obtain information as to the produce of seed per acre, and what quantity of oil that seed produced, what soil suited it best, &c. &c.

The species cultivated is the large white single Turkey poppy. I have no doubt sufficient seed might be obtained from the shops of Messrs. Les Culiniers Arabesques, as the gay French wittily call the druggists, for any gentleman to try in his own garden, and any quantity from Brussels, Antwerp, Cambray, or Mons.

T. H.

ENGLISH FARMING, &c.—With respect to the cultivation of the soil, comparing it either with France or Spain, England has decidedly the advantage, though I question whether, in this respect, it is not behind both Holland and Belgium. The largeness of our farms gives more room for the application of capital and science to agriculture; but I doubt much whether, after all, so much is made of the land as when divided into smaller farms; while all must deplore the downfall of that most useful class, the yeomanry of England. If happiness was to be found in man it was amongst that class. Now, generally speaking, the farmer is a great deal too much of the gentleman; neither he nor his sons work, while his daughters—save the mark!—would no more defile their hands with cheese or butter, than they would venture into the sun without a parasol. No farming servants are allowed to live in the house, as of old, but are driven to find a home elsewhere—early and improvident marriages and fearful pauperism follow.—From Captain Blackiston's new work—"Twenty Years of Retirement."

[Impressed with the importance of giving as much publicity as possible to the proceedings which take place at the meetings of Agricultural Societies, we have, in our present number, devoted more space than usual to the subject. It has, it is true, been at the cost of excluding a large portion of valuable practical matter, but as, at this time, it is of the highest importance to the whole agricultural body, that any means of improving the condition of the farmer, either as regards contemplated application to the legislature for relief or actual improvements in husbandry, should be made generally known, we trust we shall need no further apology for the course which we have adopted.—EDITOR OF THE FARMER'S MAGAZINE.]

### LIVERPOOL AGRICULTURAL SOCIETY.

The annual meeting of this society was held on Thursday, October 1. We are glad to hear from the report of the committee, a copy of which will be found below, and from information derived from other quarters, that not only has there been a considerable accession of members during the year, but that the benefits derived from the exertions of the society have been manifested in the adoption of improved methods of cultivation, draining, feeding, planting, breeding, and other operations connected with agriculture, and in the spirit of emulation which has been excited amongst the farmers in this extensive and important district. The society may now be considered as fairly established, and the experience of the past holds out the most encouraging prospects for continued and increasing exertions in future. We are glad to see that it is intended to have an annual ploughing match at Newton, for we are convinced that nothing tends more to the removal of old prejudices, and the adoption of improvements, than these periodical meetings, at which farmers may assemble together, become acquainted with each other's plans, and, by learning what their neighbours have done, be encouraged to attempt to do the same themselves, whilst at the same time they may learn to avoid the errors into which others have fallen. With these general remarks, we shall now proceed to give some account of the proceedings of the day.

The members met at the Golden Lion, at ten o'clock in the morning, for the purpose of adjudging the prizes, electing officers for the ensuing year, and transacting the usual business of the society. The show of cattle, live stock, implements of husbandry, &c. was held in the old infirmary yard, Lime-street. It was generally considered that, both with respect to the number of animals exhibited, and their quality, there was a marked improvement compared with the exhibition of last year. We thought ourselves there was some falling off in the former particular with respect to almost every class of animals, excepting the sheep, of which many fine specimens of the Leicester and Southdown breeds were exhibited.

The following is a copy of the report of the committee:—

"The sixth anniversary of the Liverpool Agricultural Society brings the committee once more before its subscribers and the public, with a repetition of the satisfactory assurances contained in the report for last year. Every expectation held out then has

been amply realized; new subscribers have been enrolled; new prospects of advancement of the society's best interests continue to open upon its friends; improved methods of cultivation are daily gaining ground; and an exhibition of stock, &c. has to-day been presented, on the character of which it is unnecessary to comment. The public are well able to form their own approving estimate.

Where all connected with the society is of an encouraging description, it would be superfluous to dwell upon particulars; but there is one subject, the importance of which may justify the committee's solicitude, and a more marked notice. It is impossible for any one at all conversant with farming to survey the district embraced by the society's boundary without recognizing the absolute necessity of very great exertions in *draining*, to bring much of the land into any thing like a productive state, or to justify the application of capital or skill in any of the improved modes of cultivation which the society may be instrumental in recommending.

"The committee is, therefore, particularly anxious to impress equally on the landlord and tenant, that draining is the first essential step towards improvement and profit, and that, until it has been extensively and effectually accomplished, skill, labour, and manure, are alike unprofitably expended on the soil.

"To such members of the society as are not cognizant of the fact, it will not be superfluous to state that a ploughing match, under the auspices of the society, has taken place at Newton, attended by circumstances highly gratifying and encouraging as regards the number of competitors and spectators, as well as the manner in which the ploughing was performed.

"This interesting and useful application of a portion of the society's energies and funds is proposed to be continued annually; and as it must tend to improve and perfect one of the most important operations of agriculture, so it is trusted that the ploughing matches to be held in future will obtain that attention and countenance to which they are manifestly entitled.

The thanks of the committee are again due to the Mayor and Corporation of Liverpool for the accommodation of the yard in which the exhibition has been held, and to Mr. Lucas for the use of the commodious room in which the society and its friends dined together."

*An Account of Premiums awarded at the Liverpool Agricultural Society's General Annual Meeting, held October 1, 1835.*

#### CLASS I.—THE BEST CULTIVATED FARMS, &c.

Premium 2.—To Thomas Littledale, Esq. of West Derby, as owner and occupier, for the best cultivated farm of 80½ acres, the society's silver medal.

3.—To Mr. John Owen, of High Leigh, as tenant and occupier, (being solely dependant upon farming) for the best cultivated farm of 158 acres, a piece of plate, value 10 sovereigns.

7.—To Mr. Thomas Whisley, of Broncoed, near Mold, as tenant and occupier, (not solely dependant upon farming) for the best cultivated farm of 112 acres, a piece of plate, value 5 sovereigns.

8.—To Henry Critchley, Esq., of Haydock, as tenant and occupier, (not solely dependant upon farming) for the best cultivated farm of 47 acres, a piece of plate, value 3 sovereigns.

10.—To Mr. Henry Occleston, of Tabley, as tenant and occupier, for improving seven acres of meadow land by irrigation, a piece of plate, value 5 sovereigns.

- 13.—To Mr. Henry Mawdesley, of Tarbuck Hall, as tenant and occupier of a farm of 265 acres, for laying 11,929 yards of drains, for most effectually draining 18½ acres thereof, the same a piece of plate, value 10 sovereigns.
- 14.—To James Heath Leigh, Esq., of Groppenhall, as tenant and occupier of a farm of 141 acres, for laying 10,462 yards of drains, for most effectually draining 20 acres thereof, a piece of plate, value 7 sovereigns.
- 18.—To Mr. John Burgess, of Utlington, for laying down 15 acres of land for permanent meadow or pasture, a piece of plate, value 4 sovereigns.
- 21.—To Mr. Robert Webster, of Litherland, as tenant and occupier of a farm of 98 acres, for having most judiciously covered with marl 17 acres, after the rate of 150 cubic yards to the acre, a piece of plate, value 3 sovereigns.
- 23.—To Mr. Laurie Fair, of Laudican, as tenant and occupier of a farm, for making the best reservoir on his premises for the reception of dung water, a piece of plate, value 3 sovereigns.

#### CLASS II.—CROPS OF TURNIPS, &c.

- Premium 4.—To Mr. John Dawson, of Granaut, near Holywell, as tenant and occupier, for the best crop of mangel wurzel, of four acres, a piece of plate, value 5 sovereigns.
- 6.—To Mr. Richard Almond, of Standish, as tenant and occupier, for the best crop of Swedish turnips, of four acres, a piece of plate, value 4 sovereigns.
- 7.—To Mr. Edward Webster, of Huyton, as tenant and occupier, for the best crop of Swedish turnips, of three acres, a piece of plate, value 3 sovereigns.
- 8.—To Mr. John Dawson, of Gronant, Holywell, as tenant and occupier, for the best crop of common turnips, of ten acres, a piece of plate, value 3 sovereigns.

#### CLASS III.—REWARDS.

- Premium 4.—To William Tipping, of Toxteth-park, farmer's man-servant to Samuel Scotson, of Toxteth-park, for ploughing 105 statute acres of land, with a pair of horses, double, without a driver, the sum of 3 sovereigns.
- 6.—To John Smith, farmer's man-servant to Robert Roskell, Esq. of Much Woolton, for 27 years' servitude, and for having conducted himself to the satisfaction of his employer during that period, 2 sovereigns.
- 7.—To William Hughes, of Cotton, in the county of Chester, farmer's man-servant to Mary Keay, of Cotton, for 22 years' servitude, and for having conducted himself to the satisfaction of his employer during that period, 2 sovereigns.
- 8.—To John Glover, farming labourer to John Okell, Esq. of Little Woolton, for 50 years' servitude, and for having conducted himself to the satisfaction of his employer during that period, 4 sovereigns.
- 9.—To William Pemberton, of Poolton-cum-Seacombe, farming labourer to Thomas Webster, Esq., for 43 years' servitude, and for having conducted himself to the satisfaction of his employer during that period, 2 sovereigns.
- 10.—To Mary Moss, of Ormskirk, farmer's woman-servant to Mr. Richard Appleton, for 31 years' servitude, and for having conducted herself to the satisfaction of her employer during that period, 3 sovereigns.
- 11.—To Mary Charlesworth, of Minshall Vernon, farmer's woman-servant to Mr. Joseph Fairhurst, for 19 years' servitude, and for having conducted

herself to the satisfaction of her employer during that period, 2 sovereigns.

- 15.—To Edward Taylor, of Billinge, labourer in husbandry, for bringing up ten legitimate children, all living, without parish relief, 6 sovereigns.
- 5.—To James Rowlands, of Arrow, labourer in husbandry, for bringing up ten legitimate children, seven of which are living, without parish relief, 4 sovereigns.

#### CLASS IV.—LIVE STOCK.

##### HORNED CATTLE.

- Premium 1.—To Richard Pilkington, Esq., of Windle Hall, for the short-horned bull, three years four months old, 15 sovereigns.
- 3.—To Mr. John Dawson, of Gronant, near Holywell, for the best short-horned bull, one year old, and bred within the limits of the Society, a piece of plate, value 5 sovereigns.
- 4.—To Mr. Charles Rimmer, of Lydiate, (being solely dependant upon farming), for the best short-horned bull, three years ten months old, and bred within the limits of the society, a piece of plate value 8 sovereigns.
- 5.—To Mr. Edward Webster, of Bold, (being solely dependant upon farming), for the second best short-horned bull, two years eleven months old, and bred within the limits of the society, a piece of plate value 5 sovereigns.
- 6.—To Mr. William Bloor, of Holywell, (being solely dependant upon farming), for the third best short-horned bull, two years six months old, and bred within the limits of the society, a piece of plate value 2 sovereigns.
- 7.—To William Bloor, of Holywell, for the best bull, one year six months old, a piece of plate value 5 sovereigns.
- 8.—To Mr. William Howard, of Knowsley, for the second best bull, one year three months old, a piece of plate value 3 sovereigns.
- 9.—To Richard Pilkington, Esq., of Windle, for the best dairy cow, a piece of plate, value 7 sovereigns.
- 10.—To Mr. Thomas Picton, of Liverpool, for the second best dairy cow, a piece of plate, value 4 sovereigns.
- 11.—To Peter Greenall, Esq., of St. Helen's, for the best two-year-old heifer, a piece of plate, value 3 sovereigns.
- 12.—To Richard Pilkington, Esq., of Windle, for the best one-year-old heifer, a piece of plate, value 3 sovereigns.
- 13.—To Mr. Edward Webster, of Bold, (being solely dependant upon farming), for the best two year-old heifer, bred within the limits of the society, a piece of plate, value 5 sovereigns.
- 14.—To Mr. Richard Jackson, of Knowsley, (being solely dependant upon farming), for the second best two-year-old heifer, bred within the limits of the society, a piece of plate, value 2 sovereigns.
- 18.—To Peter Greenall, Esq., of St. Helen's, for the best fat cow, showing the most symmetry, fat, and weight, a piece of plate, value 5 sovereigns.
- 19.—To Mr. Thomas Picton, of Liverpool, for the second best fat cow, a piece of plate, value 3 sovereigns.
- 20.—To Mr. John Dawson, of Gronant, Holywell, for the best cow for feeding after milking, a piece of plate, value 3 sovereigns.
- 21.—To Mr. Thomas Picton, of Liverpool, for the second best cow for feeding after milking, a piece of plate, value 2 sovereigns.

##### HORSES.

- 22.—To Mr. Thomas Robinson, of Bold, for the

- best stallion for the general purposes of agriculture, a piece of plate, value 10 sovereigns.
- 23.—To Messrs. J. and J. Rimmer, of Scarisbrick, for the second best stallion for the general purposes of agriculture, a piece of plate, value 7 sovereigns.
- 24.—To Mr. James Shepherd, of Kirkby, for the best brood mare for the general purposes of agriculture, a piece of plate, value 5 sovereigns.
- 25.—To Mr. John Gore, of Knowsley, for the second best brood mare for the general purposes of agriculture, a piece of plate, value 3 sovereigns.
- 26.—To Mr. James Cook, of Eccleston, for the best brood mare of the waggon kind, a piece of plate, value 5 sovereigns.
- 27.—To Mr. Joseph Swift, of Eccleston, for the best yearling filly for the general purposes of agriculture, a piece of plate, value 3 sovereigns.
- 28.—To Mrs. Ann Brownbill, of Kirkby, for the best two-year-old colt, for the general purposes of agriculture, a piece of plate, value 4 sovereigns.
- 29.—To Mr. James Cook, of Eccleston, for the best two-year-old colt for the general purposes of agriculture, a piece of plate, value 4 sovereigns.
- 30.—To Mr. William Howard, of Knowsley, for the best three-year-old colt, for the general purposes of agriculture, a piece of plate, value 5 sovereigns.
- 31.—To Henry Hesketh, of Kirkby, (being solely dependant upon farming), for the best pair of horses for the general purposes of agriculture, a piece of plate, value 5 sovereigns.
- 32.—To Mr. William Knowles, of Bootle, (being solely dependant upon farming), for the second best pair of horses, for the general purposes of agriculture, a piece of plate, value 3 sovereigns.

## SHEEP.

- 33.—To Sir Edward Mostyn, Bart., of Talacre, for the best pen of three yearling Leicester ewes, the society's silver medal.
- 34.—To Mr. Robert Jenkinson, of Mold, for the best pen of three yearling Southdown ewes, a piece of plate, value 3 sovereigns.
- 35.—To Sir Edward Mostyn, Bart., of Talacre, for the best Leicester ram under three years old, the society's silver medal.
- 36.—To Mr. Richard Johnson, of West Derby, for the best Southdown ram, a piece of plate, value 2 sovereigns.
- 38.—To Mr. J. C. Etches, of Liverpool, for the best pen of five fat ewes, a piece of plate, value 2 sovereigns.
- 39.—To Mr. Samuel Scotson, of Toxteth-park, for the best pen of five fat Leicester ewe lambs, a piece of plate, value 2l 10s.

## PIGS.

- 40.—To Mr. John Dawson, of Gronant, near Holywell, for the best boar, eleven months old, a piece of plate, value 4 sovereigns.
- 41.—To Mr. John Watkinson, of Manchester, for the second best boar, eleven months old, a piece of plate, value 3 sovereigns.
- 42.—To Mr. John Etches, of Liverpool, for the best breeding sow, two-and-a-half-years-old, a piece of plate, value 3 sovereigns.
- 43.—To Mr. John Dawson, of Gronant, Holywell, for the second best breeding sow, eleven months old, a piece of plate, value 2 sovereigns.
- 44.—To Mr. J. Dawson, of Gronant, near Holywell, for best fat pig, eleven months old, a piece of plate, value 2 sovereigns.
- 45.—To Mr. Thomas Palmer, of Walton, for the

second best fat pig, one year and five months old, a piece of plate, value 30 shillings.

- 46.—To Mr. James France, of Liverpool, for the third best fat pig, thirteen months old, a piece of plate, value 1 sovereign.

## EXTRA STOCK.

- 47.—To Richard Pilkington, Esq., of Windle, for the best cow of any breed, the sum of 5 sovereigns.
- 48.—To Sir Edward Mostyn, Bart., of Talacre, for the best two-year-old heifer, the sum of 4 sovereigns.
- 49.—To Peter Greenall, Esq., of St. Helen's, for the best one-year-old heifer, the sum of 2 sovereigns.
- 50.—To Edward Greenall, Esq., of St. Helen's, for keeping the best stallion of the cart breed to serve the mares of his tenantry gratis, the society's silver medal.
- 51.—To Sir Edward Mostyn, Bart., of Talacre, Flint, for keeping the best boar to serve the sows of his tenantry gratis, the society's silver medal.
- To Mr. John Meacock, of Liverpool, for a dairy cow, the society's silver medal.
- To Sir Edward Mostyn, Bart. of Talacre, for a dairy cow, the society's silver medal.
- To Richard Pilkington, Esq., of Windle, for a dairy cow, the society's silver medal.
- To Mr. Samuel Scotson, of Toxteth-park, for a fat ox, the society's silver medal.
- To Mr. John Meacock, of Liverpool, for a superior cow for feeding after milking, the society's silver medal.
- To Thomas William Coke, Esq., of Holkholm, for a ram and six ewes of the improved Southdown breed, the society's silver medal, much admired.
- To Mr. James Heaps, of Little Hulton, for a superior stallion, the society's silver medal.
- To Mr. George Booth, of Liverpool, for a very superior three-year-old colt, the society's silver medal.

## IMPLEMENTS, ROOTS, SEEDS, &amp;c.

- To Mr. Abraham Vickers, of Manchester, for a hay and straw cutter: and also for a cream extractor, (on a new construction), the society's silver medal.
- To Thomas Robert Wilson France, Esq., of Rockliffe Hall, near Garstang, for a superior implement for cutting and raising turves for drain covers; and also for other tools for cutting the drains, the society's silver medal.
- To Mr. J. Orrell, of St. Helen's, for exhibiting a probe and conductor for relieving choking cattle, the society's silver medal.
- To Mr. William Cartmel, of ———, for a superior hay-cutting machine, the society's silver medal.
- To John Aspinall, Esq., of Netherton, for exhibiting a glass of honey, containing 1½lbs, collected on Mr. Hutt's system, the society's silver medal.
- To Mr. William Skirving, of Walton, for exhibiting some specimens of the Kohl Rabi, Swedish, and other turnips, and mangel wurzel, the society's silver medal.
- To Mr. William Ashcroft, of Halsall, for exhibiting a quantity of roots of superior mangel wurzel, the society's silver medal.
- To Messrs. George Gibbs and Co., London, for some superior specimens of the Turkey onion grown in this country; and for some Egyptian clover, and other superior grass seeds, the society's silver medal.
- To Mr. William Skirving, for some superior specimens of the Italian grass and other seeds, the society's silver medal.

## SWEEPSTAKES.

- 1.—To Richard Pilkington, Esq., of Windle Hall, for the best short-horned bull, 2l 2s.
- 2.—To Richard Pilkington, Esq., of Windle, for the best two-year-old short-horned bull, 1l 1s.
- 3.—To Mr. William Bloor, of Holywell, for the best one-year-old short-horned bull, 1l 1s.
- 5.—To Richard Pilkington, Esq., of Windle, for the best short-horned cow in calf or milk, 3l.
- 6.—To Sir Edward Mostyn, Bart., of Talacre, for the best cow of any breed, 1l 1s.
- 8.—To Sir Edward Mostyn, Bart., of Talacre, for the best two-year-old short horned heifer, 1l 1s.
- 9.—To Richard Pilkington, Esq., of Windle, for the best one-year-old short-horned heifer, 1l 11s 6d.
- 10.—To Richard Pilkington, Esq., of Windle, for the best bull-calf under one-year-old, 1l 11s 6d.
- 11.—To Mr. William Bloor, of Holywell, for the best cow-calf under one-year-old, 2l 2s.

## THE DINNER.

The Annual Dinner of the Society took place at the large rooms of Lucas's Repository, Great Charlotte-street. Accommodations were provided for about 550 guests, and fully that number sat down to a good and substantial dinner, prepared by Mr. Horne, of the Mersey Hotel. Lord Stanley, the president of the society, entered the room a few minutes after five o'clock, and took the chair amidst the loudest cheering. He was supported on the right by his Worship the Mayor, James Aspinall, Esq., the Rev. Mr. Blackburne, and Colonel Hornby; on the left by John Ireland Blackburne, Esq., M.P., J. W. Patten, Esq., M.P., and Henry Bold Houghton, Esq. The following gentlemen were also present:—Sir Edward Mostyn, Bart., R. B. Wilbraham, Esq., M.P., the Rev. R. Rawstorne, Penwortham, Thomas Robinson, Wilson France, Esq., C. Hillyard, Esq., president of the Northampton Agricultural Society, T. B. Cross, Esq., Shaw-hill, —Barley, Esq., P. H. Fleetwood, Esq., M.P., Henry Critchley, Esq., John Formby, Esq., Richard Pilkington, Esq., Peter Greenall, Esq., E. Unsworth, Esq., &c., &c. The cloth was drawn at about a quarter past six o'clock, and the following toasts were then proposed from the Chair, and received with the usual honours:—

"His Majesty the Duke of Lancaster."

"Her Majesty the Queen."

"The Princess Victoria and the rest of the Royal Family."

"The Navy and the Army."

The CHAIRMAN in announcing the next toast said, Gentlemen, I must now take the liberty of calling upon you, as I have often had the pleasure of doing in this room before, for a bumper toast with three times three, and though I do not think it necessary to use many arguments in order to induce you to drink, with all the honours, the prosperity of that society which is the main object of our present meeting, still I can hardly allow that toast to be proposed without prefacing it with a few observations. I am happy to say, Gentlemen, that these observations will mainly be in the spirit of congratulation on our continued success and improvement. Those who have done us the honour of visiting us from parts of the country where these societies have long been established, and who came to look at our infant exertions, must, of course, remember that this society is yet but in its infancy, and must make allowances for the deficiencies which they cannot fail to perceive; but even to these gentlemen, if

they have been here before, I confidently appeal to say whether whilst they still perceive deficiencies in the exhibition of this day, they do not also perceive a manifest improvement not only over that of the last year, but still moreover those which preceded it? Gentlemen, the surest and best way to promote permanent success and real improvement is to perceive our deficiencies, to remedy them, and not to be satisfied without going still further in the march of improvement. Gentlemen, I see great improvement already, not only in our agricultural operations, but also with respect to that spirit and excitement of competition among the farming population, and I am happy to say that competitors come here amongst us,—sometimes carrying off premiums, sometimes defeated by us, not only from our own immediate neighbourhood, but from distant counties also. I am happy to congratulate you on the fact that our neighbours in Wales have not this year carried off all the prizes, as they did last year. (*Cheers*). Amongst the successful competitors for cattle we have, however, the familiar names of Dawson and Bloor, but I recommend them also to look out lest they should be defeated next year. There are several great monopolists of cattle. Mr. Gregn has carried off four premiums, whilst that unconscionable gentleman, Mr. Pilkington, is satisfied with no less than nine premiums in cattle only. (*Laughter and applause*.) Gentlemen, I must say that I do not grudge Mr. Pilkington his prizes, for all who saw the stock exhibited by him this day must be satisfied that he well deserved the success which he has obtained. (*Applause*.) I believe, gentlemen, there is a peculiarity in this meeting with regard to premiums for cattle which deserve imitation elsewhere, I mean the separate premiums for cattle bred by the *bona fide* farmers of the county. We must all be sensible that there are many farmers who are utterly unable to compete on equal terms with men of large capital who can afford to spend much money in the pursuit of a favourite science, and therefore that it is most desirable for the purpose of encouraging those who are desirous to excel to invite them to a competition in which they have a fair chance of success, where, in their endeavours to improve they may meet their competitors in a fair field and with no favour. (*Cheers*.) At all events, gentlemen, we have not deteriorated since last year. If we have not improved in the class of pigs which we have showed to-day, we have certainly much improved in cattle, and we have not fallen off in pigs, so that we need not be afraid of Ireland under selling us in our own market. (*Laughter and applause*.) One thing, however, must have struck a stranger with astonishment—I mean the very indifferent show of horses for agricultural purposes, which is the more remarkable, because I may venture to say that the farmers in this part of the country exhibit better teams in the ordinary work of their farms than have been shown this day. (*Applause*.) Gentlemen, there is one of the premiums given by this society to which I can never advert without feelings of the strongest satisfaction,—feelings which I have expressed year after year,—feelings which will not suffer by repetition, because they ought to be impressed on the minds of both the high and the low in this county, as well as of those who come from other parts of the country,—I mean the premiums to farmers' servants and agricultural labourers for long and faithful services in the employment of the same master. (*Hear, hear, and cheers*.) It affords me very great satisfaction to say that amongst the claimants for this class of most valuable prizes, not one of them claims for a less period than nine-and-twenty years of faithful service,

(*Cheers.*) Two of them claim for nine and-thirty years, two for forty-nine years, and one who claims for the full period of fifty years of faithful service.

(*Cheers.*) Gentlemen, this is a class of our agricultural population, and this is a feature amongst them of which we have never had cause to be ashamed, and in which we may challenge competition with any county in England. I have also to congratulate the society on the facts, that whilst the number of subscribers has not fallen off in the present year, the amount of the funds has considerably increased, and that that increase has enabled us not only to discharge a portion of a very small debt of 45*l* which remained last year, but would have left us a surplus in hand if we had not enlarged the sphere of our operations by a new undertaking, calculated to confer the greatest benefit on the agriculturists of this county; I mean the ploughing match which has been established this year for the first time, which will be continued annually in future, and which has already produced one great benefit, that of convincing the competitors of their own deficiencies, and of their own capability of improvement. (*Applause.*) This, gentlemen, is the real object of all competition in agriculture. A man looks at his own stock, and learns to admire them and think them perfect; he looks at his own farming implements, and he sees no reason to suppose them capable of improvement; and in like manner the farmer's labourer thinks himself an exceedingly good ploughman, and does not see how it is possible that he should be surpassed. (*Laughter.*) Now all these classes find that they have been mistaken, and more especially with respect to ploughing. The farmer finds that the plough is capable of material improvement; the ploughman sees that other people do the work better than he can, and thus a spirit of emulation is excited, and the means are shown by which that spirit of emulation is to be carried to its proper and successful result. I need hardly say to gentlemen who have given their attention to agriculture, that one object accomplished by these ploughing matches is to show the preference which ought to be given to ploughing with two horses over any other mode. I hope, gentlemen, that one of the consequences of this ploughing, match will be to show the farmers that it is not the best mode of economising their means to make four horses and two men just do the work which might be done by two horses and one man. (*Laughter and applause.*) I ought, perhaps, to apologise for trespassing so much on your time, little acquainted as I am with agricultural matters. ("No, no.") I have watched the progress of this society with great interest. I have seen it begin shamefully deficient in stock; I have seen it gradually improve; I have seen the show of each year better than that which preceded it; and I have seen a spirit excited, both amongst landlords and tenants, which, I have no doubt, will enable us in future years far to outdo the progress which has been made up to the present time. (*Cheers.*) I have, therefore, no doubt that you will drink, with all the honours,—

"Success and prosperity to the Liverpool Agricultural Society."

This toast was drunk standing, with three times three, in the most enthusiastic manner.

JAMES ASPINALL, Esq., the Mayor, then rose and proposed the health of

"The Earl of Derby—the Patron of the Society." (*Loud and long continued cheering.*)

LORD STANLEY returned thanks.

J. WILTON PATTEN, Esq., then proposed the health of Lord Stanley, the President of the Liverpool Agricultural Society. This toast was received with

most vehement and long continued cheering. After it had somewhat subsided,

LORD STANLEY rose and said, that in former times, in Scotland, when agricultural knowledge was not quite so far advanced as it was at present, it was customary for agricultural labourers to stipulate that they should not be fed with salmon more than three days in the week, and he thought that three speeches in one night were rather too much to expect from one individual. (*No, no.*) He should, however, be wanting in the common feelings of humanity if he did not say how deeply he was affected by the enthusiastic kindness shown towards him that evening. It was not by occupying the time with long, though not with heartless thanks, but by endeavouring to fulfil the duties of the station which he occupied, that he could best evince his sense of the honour done to him on this occasion. (*Cheers.*) During the six years in which this anniversary had been held, he had had the honour of presiding at four; he had only been prevented from attending at the other two by business of deeper and more general importance, and he trusted that no circumstances, excepting those to which he had alluded, would prevent his taking the chair at any succeeding anniversary. (*Applause.*) Whilst he had filled the situation of president the society had gradually and steadily improved. (*Cheers.*) His Lordship, in conclusion, again thanked the company for the kind manner in which they had drunk his health, and said that from the bottom of his heart he drank their good healths in return.

LORD STANLEY then proposed the health of the Mayor and Corporation of Liverpool. (*Loud cheers and three times three.*)

JAMES ASPINALL, Esq., returned thanks.

LORD STANLEY said.—He had been in hopes that, before this time, the printed lists of the premiums would have been prepared, and that we should have been enabled to distribute them at this time; in the course of a short time they will be so; and I am sure that, in the meantime, it will be no unpleasant interruption to those who have heard him before, if I call upon Mr. Shaw, our Poet Laureate, for a song,

Mr. SHAW then sung a humorous song, which elicited loud cheers and laughter, in which none joined more heartily than the Noble President himself, particularly at those happy parts where allusion was made to himself.

LORD STANLEY then said, we must now proceed, if you please, to the business of the evening by distributing the prizes to the successful candidates. I could wish that they had been so arranged so as to enable me to save one gentleman, Mr. Pilkington, for instance, the trouble of coming more than once to receive his prizes, though Mr. Pilkington could not have carried them if he had. I must, therefore, apologize to the gentlemen for the trouble which they may have. (*Cheers and applause.*)

The Noble PRESIDENT then proceeded to the execution of his grateful task of distributing the prizes amongst the proud and successful winners, accompanied with appropriate and humorous remarks to each individual, which greatly contributed to the variety and amusement of the evening. After its completion he again continued,—

We have now delivered the whole of the prizes which are given, either in sweepstakes or pieces of plate. Some others have to be delivered to several gentlemen in medals, and we cannot do better than, in giving them, to drink the health of Sir Edward Mostyn, whom we saw here last year, and whom I hope to see here upon future occasions, entering into

honourable competition with us. I propose Sir Edward Mostyn and the agriculturists of Wales.

This toast was drank amidst the loudest demonstrations of applause. A considerable time having elapsed without Sir E. Mostyn having risen to acknowledge the honour conferred upon him,

Lord STANLEY again rose and said,—I was in hopes, from having seen Sir E. Mostyn in the show-yard, this day, that he would have been here this evening, but I regret that he is prevented, through indisposition. I hope, however, that he will be here on a future occasion. In the meantime, I beg to propose to you the health of the successful candidates, with the hope that we shall meet them here again next year. *(Cheers.)*

Lord STANLEY then proposed the health of the members for the southern division of the county.

R. B. WILBRAHAM, Esq., returned thanks.

H. B. HOUGHTON, Esq., proposed the health of the members for the northern division of the county, Lord Stanley and J. W. Patten, Esq., which was drank with loud applause.

Lord STANLEY in returning thanks, said—"Gentlemen, I beg leave to express my most grateful thanks for the honour you have done me as one of the representatives for the northern division of this county, and though not immediately representing the interests of the great majority of those whom I am now addressing, I trust you need no assurance that my services will be given equally to both divisions of this county, for I am not able to consider them as separated, except nominally, and shall always desire to see them as closely connected as possible. *(Cheers.)* I make no apology for saying in a commercial rather than a manufacturing town—and I should require no apology for saying it in a manufacturing town—that a member of Parliament would very ill fulfil the duties of his station with reference to the interests of the empire at large, if he did not consider it especially his duty to protect and guard, as far as may be, the agricultural interest. *(Cheers.)* At the same time, however, I am bound to say that those are the truest and sincerest friends of the agricultural interest who warn them against entertaining any exaggerated or overstrained expectations of the relief which it is in the power of Parliament to extend to them. I am convinced that the sooner those delusions, for delusions they are, are got rid of, the better it will be for both landlord and tenant. I believe that somewhat is in the power of Parliament for the relief of the agriculturists; I believe it possible to serve them by the equalization of those local burdens which press more heavily on the landed than on any other interest; but I should consider myself as shrinking from the duty I have to perform as a representative of all classes in Parliament, if I did not say that the expectations sometimes entertained, that Parliament either ought or that Parliament can keep up high prices of agricultural produce for the exclusive benefit of the agricultural interest, are altogether unfounded. I say, therefore, whilst I think that the landed interest ought to be protected by parliament, and whilst I will, as a member of Parliament, always do my best to protect it consistently with a course of enlightened policy, that we must look for the relief of the agricultural interest less to anything that can be done in Parliament than to a proper understanding between landlord and tenant, to increased skill and knowledge, and to an increased desire on the part of both to make the most of the abundant materials placed in their hands towards forwarding the national prosperity. I beg pardon for entering on these topics, but having had my health drunk as a member for the agricultural division of a great commercial county, I did not think it an un-

fitting opportunity for saying what I thought might be done for the agricultural interest, and discountenancing expectations which must end in disappointment.

Mr. J. W. PATTEN also returned thanks.

Lord STANLEY then said,—It is always a satisfaction to us, gentlemen, to see that meetings are attended by strangers from different counties, but it is a double satisfaction that many, practically conversant with agriculture, who visited us one year, are ready to visit us another, to see the progress we have made in the meantime. Amongst the strangers who have visited us this year that were present on the last occasion, I am happy to see Mr. Hillyard, and as the president of an agricultural society in one of the most flourishing counties in England, I am glad to propose his health, and to thank him for his attendance this day. *(Cheers.)*

Mr. HILLYARD, in returning thanks, said—"The very flattering manner in which my health has been proposed and received really overpowers me, and I am sure I cannot at all express what I could wish upon the present occasion. *(Cheers.)* I am happy to tell you that the Farming and Grazing Society in the county of Northampton, of which I am the president, is going on most prosperously; but, gentlemen, when I tell you who is its patron, you will not be surprised that it is going on flourishing, it is my Lord Spencer—*(Cheers)*—and most happy should I be to report to that noble lord, and to all our friends in our agricultural county, what I have seen at Liverpool this day; I see here, in the first commercial town in the first country in the world, men of all parties assembled in the common cause, the support of agriculture. I could say more, had I the power to speak what I feel upon the present occasion. I will advert to what our President has said—"It is an infant society." Upon my word I should not have known it, had I not been told so. When I looked at the cattle-show this day, I could not have told that it had been an infant society, otherwise the beasts very soon attained their maturity. *(Laughter.)* We are a breeding country, but if I had the liberty of selecting such males as I could select, and such females as I could select, I have no doubt that in the course of time, it must be that of four years, that I could get from this county—*(laughter)*—that I could, I repeat, get from this county—*(repeated laughter)*—an ox to take away the best prize that we ever had or ever shall have.—*(Cheers.)* We always go from our show, which is a sort of a nursery, to London, and I have no doubt if I had the beasts I have mentioned, we should cut a respectable figure in Smithfield. I have not visited this town as a judge, though I have the honour to fill that honourable situation in Manchester. I must say that this is a very useful society. I never compliment, and I will say, and with truth, that the worst boar that was shown this day would have got our prize upon the 19th September. *(Cheers.)* Gentlemen, as a sheep county I do not conceive that you are much. *(Laughter.)* But, however, this I can say positively, that there is an evident improvement in the sheep I saw this day, compared with those of last year. *(Cheers.)* The best sheep you can have is that which will produce the greatest quantity and the most valuable flesh and wool, and I do think you ought to breed that sort. Perhaps we sometimes run into extremes: no doubt the Leicester sheep are the best in the world, but I begin to think we are getting them too fat: I think the grossly fat sheep of our county would not suit the stomachs of the manufacturers of Lancashire. I beg pardon for taking up your time, but I recommend you to pro-

ceed in the way you are going on, and, depend upon it, the Liverpool Agricultural Society will vie with any in the kingdom. (*Loud cheering.*)

LORD STANLEY next rose and said, the speech which you have just heard from the President of the Northampton Agricultural Society savoured, as it ought to do, of business; we will now get a little out of the line of business. I shall take the liberty of calling for a song from a person whom you have perhaps heard of before.—of the name of Ezekiel Homespun. If he is in readiness, I shall be happy to have the pleasure of hearing him.

MR. SHAW then delivered a humorous speech and song, in the character and dress of a raw country peasant, which created much laughter.

LORD STANLEY then said, it is right that we should not forget the obligation we owe to those gentlemen who have discharged the ordinarily invidious duty of adjudicating the prizes to the satisfaction of all parties. I propose to you the health of the judges of cattle and sheep,—A. Jones, Esq. of Welshpool, J. Wood, Esq. of Kimbleworth, near Durham, and Benjamin Crowtham, Esq., Byrom, near Ferrybridge; as well as those of horses, namely, John Scott, Esq., of Preston, and J. Oakden, Esq., of Knutsford. (*Cheers.*)

A. JONES, Esq., in returning thanks, said, as a humble individual who has had the honour to-day of officiating as one of the judges, my fellow judges have deputed me to return you thanks for the high compliment you have paid them. If I were to address you upon the subject of the superlative ability of our President, I should be very much wanting in words, indeed, in attempting to say any thing which you are not already aware of. (*Cheers.*) But when I see him surrounded with the wealth, the wisdom, and the worth of the inhabitants of this county,—when I see him thus surrounded for the purpose of supporting the falling agriculture of the country, what can we do more than to tell him that we are not to die in despair, but we are to expect every thing from the intelligence and wealth of the land? You, Gentlemen, who have supported the falling agriculture of the country, in the way which you have to-day done it,—a way which it will never be in my power to express; but I shall attempt to express to every agriculturalist whom I have ever the pleasure of meeting what I have this day seen. And I can tell you that I have met an agriculturalist who has come two hundred miles distant for the purpose of experiencing a pleasure which I am sure we have met with here. We were told by a gentleman that we should see nothing in the agricultural show-yard in Liverpool, that we as agriculturalists could call good: but we have the proud satisfaction of telling you that the stock which we have seen this day is such as no county in England or the world can surpass. Mr. Hillyard has told you that if he were to attempt breeding he would come to Liverpool for the females; and if I might be allowed to draw a comparison, I would say that the females of the cow tribe bear the same comparison to the bull tribe in this county as the women of Liverpool do the men. (*Cheering and laughter.*) I will tell you that the cow tribe shown this day is superior to any thing I have ever seen; but I hope that you will attempt to make the bull tribe as superior as they ought to be in the scale of creation. (*Cheers and laughter.*) To tell you what we felt would be extremely irksome to you; but as long as you have your worthy president at your head, this society will flourish year after year, and I expect that, after twenty years shall elapse, it will eclipse every thing in the world as an agricultural society.—

(*Cheers.*) Agriculture has sunk in some counties almost into oblivion, but oblivion it will never come into here as long as Lord Stanley shall continue amongst you. My comments upon the bulls may not have been gratifying to you, and I must also agree with Lord Stanley in saying that the horses are not such as might have been expected in the county of Lancaster; indeed I have never, in the course of my agricultural experience, seen such a bad show of horses as I have seen this day exhibited; where so much is offered as a premium, better horses might have been expected. With respect to the sheep, there could not have been a better exhibition. I shall be proud to come among you upon future occasions, and whether as a judge or spectator, shall always be extremely gratified to see the progress you are making in the improvement of agriculture. (*Loud cheering.*)

LORD STANLEY next proposed—"The Lancashire Witches," and, in connexion with it, "Breeding in all its branches." (*Loud cheers.*)

LORD STANLEY next proposed—"The health of all gentlemen to whom we are indebted for the excellent management which we have seen to-day, the Secretary and the arranging Committee of the Society." (*Loud cheers.*)

MR. WHITE, in returning thanks, said that this was the second time he had had occasion to do so in his own behalf, and that of the managing committee, for the kind manner in which their health had been drank. There was no doubt that if the society proceeded as it had begun it would soon be one of the most important in the kingdom.—(*Cheers.*)

MR. UNSWORTH, of Maghull, proposed—"Liberal landlords and industrious tenants," which was drank with loud applause.

Shortly afterwards, at twenty minutes to ten o'clock, he vacated the chair, and left the room accompanied by the greater part of the company. Mr. Peter Greenalgh, of St. Helen's, was then called to the chair, and the festivity of the evening was kept up for some time longer.

## GREAT AGRICULTURAL MEETING AND SHOW OF LIVE STOCK AT AYR,

UNDER THE PATRONAGE OF THE  
HIGHLAND AND AGRICULTURAL SOCIETY OF SCOTLAND.

This great Meeting, the anticipation of which had excited a very lively interest for some time past in the West of Scotland, took place at Ayr, on Friday, the 2d of October, under the direction of a Committee, consisting of the Marquis of Tweeddale, senior Vice-President, acting as President in the unavoidable absence of his Grace the Duke of Gordon; the Vice-Presidents, the Lord Lieutenants, the Vice-Lieutenants and Conveners, with various noblemen and numerous gentlemen from the counties of Ayr, Wigton, Renfrew, and Bute. The committee held its first meeting on Thursday last in the Town Hall, and proceeded to elect the various Sub-Committees to superintend the minute details of the Show, and the practical Judges for the different departments of Live Stock. The Committee afterwards, along with the Judges dined at the King's Arms Inn, Mr. Kennedy, of Dunure, one of the Extraordinary Directors of the Society and Convener of the Committee, in the Chair, supported on the right and left by the Marquis of Tweeddale and Bute, and the Earl of Eglington. A large party of noblemen and gentlemen had thus a favourable opportunity of previously assembling together before entering on the more

arduous and onerous duties of the following day. Mr. Kennedy discharged the duties of chairman with admirable taste and spirit.

On the following morning, the most numerous stock that was ever exhibited at any of the Shows under the patronage of the Society was early brought forward, and placed in the pens allotted to them without the least accident or confusion, the total number of animals exhibited amounting to 760. The Show-Yard was constructed at the Fort, on the same principle as those at Stirling and Aberdeen; and in its arrangements and accommodation, seemed to afford entire satisfaction to the very numerous assemblage who attended on the occasion. By ten o'clock every thing was ready for the Judges to enter on their delicate duties.

#### I. — CATTLE. *Ayrshire Breed.*

The first to be noticed of the various Classes of Stock brought forward in this part of the country, is naturally the Ayrshire Dairy Stock.

In the class of Ayrshire aged bulls, sixteen competitors appeared. The first premium of twenty sovereigns was awarded to Mr. John Baird, Highcross, Old Monkland, Lanark; the second of ten sovereigns to Mr. William Peter, at Temple, East of Kilpatrick, Dumbarton. In this class, the Judges recommended the bulls of Mr. James Allen, Blackstone Dalry, Ayrshire, and Mr. Alexander Crichton, Middleton, Irvine, Ayrshire. In the class of bulls calved after 1st January, 1833, the first premium was awarded to Mr. John Gray, Tongue, Ayrshire; and the second to Mr. David Hutcheson, Green, Renfrewshire. Besides the premium stock, the Judges in this class commended the bulls of Mr. James Jameson, Ladeside; and of Mr. Thomas MacCreath, Belsley-hill, in Ayrshire.

In the class of Cows of the same breed, the first premium was gained by Mr. William Hunter, Montford, Ayrshire; and the second by Mr. Lawrence Drew, Cormyle, Lanarkshire. The cows commended in the class were those of Mr. John Dunlop, Outnains, Ayrshire; and Mr. Ebenezer Storrie, Gavel Garden, Stirling.

For the best Fat Cow of the same breed, not under four years old, the premium was awarded to Mr. John Findlay, Lyonstone, Ayrshire.

In the class of Cows of the same breed, calved after the 1st January, 1832, which shall have had a calf, or in-calf on the day of competition, the premium was awarded to Mr. John Black, Easterhouse, Lanarkshire. The Judges recommended the cows of Mr. Hugh Kirkwood, Highlangmuir, and Mr. James Templeton, Netherairg, Ayrshire.

In the class of Heifers of the same breed, the first premium was awarded to the pair of heifers belonging to Mr. John Findlay, Leonstone; the second to Mr. Adam Skeoch, Ardrossan Mill, Ayrshire. The pairs of heifers of the class which deserved recommendation were those which belonged to Sir James Fergusson of Kilkerran, and Mr. William Guthrie, Busbie, Ayrshire.

For the best pair of Quey Stirks, not exceeding 21 months old, of the same breed, the premium was awarded to Mr. John Forrest, Sandylands, Lanarkshire. The pairs belonging to Mr. William Jack, Little She Walton, and Mr. David Wright, Sanquhar, were commended.

In the class of the best Ox of the same breed of any age shewing most symmetry, fat, and weight, the premium was awarded to the Marquis of Bute.

For the best two Oxen calved after 1st January, 1832, the premium of ten sovereigns was awarded to Sir David Hunter Blair; and for the pair calved after 1st January 1833, the premium of ten sovereigns was adjudged to the Marquis of Bute. The pairs of oxen belonging to Mr. James Kennedy, Lochlands, and Mr. David Tennant, Hawkhill, Ayrshire.

#### GALLOWAY BREED.

The next class of animals to be mentioned is the Galloway breed. The number exhibited in this class was much less numerous than might have been expected from the proximity to the breeding district to which it peculiarly belongs.

In the class of bulls of this breed, the first premium of fifteen sovereigns was awarded to Mr. William Brown, Endrick, Wigtonshire, and the second of seven sovereigns, to Mr. Thomas Fergusson, Dinmurchie, Ayrshire.

For the pair of Oxen of the same breed not under three years old, showing symmetry, fat, and weight, the premium of ten sovereigns was awarded to Mr. W. Mure, Grange, county of Kirkcudbright; and for the best pair of spayed heifers, Mr. Mure also gained the premium of ten sovereigns. The Judges were anxious to notice the pure breeding and symmetry of Mr. Mure's stock, and particularly those of the spayed heifers.

In the class of Cows of the same breed, the first premium of ten sovereigns was awarded to Mr. Thomas Fergusson, Dinmurchie, and the second of five sovereigns to Mr. William Sproat, in Borness, Kirkcudbright.

For the best two Queys of the same breed, the premium of ten sovereigns was awarded to Mr. William Mure, on account of merit, although there was no competition in this class.

#### SHORT-HORNED BREED.

In this class the competition could not be reported to be great, in this quarter of the country, where much attention is paid to the Ayrshire breed of cattle.

In the class of Bulls of this breed, the premium of twenty sovereigns was awarded to T. F. Kennedy, Esq., of Dunure. The Judges expressed it as their opinion that the bull belonging to Mr. George Reid, Ballancrief, East Lothian, possessed great merit.

In the class of Cows of this breed, Mr. Reid obtained the premium of ten sovereigns.

For the best short-horned of any age, the premium of ten sovereigns was awarded to Mr. James Kennedy, senior, Lochlands, Ayrshire, and in this class the ox belonging to Mr. Hugh M'Jannet, Drumshang, possessed considerable merit.

#### WEST HIGHLAND BREED.

In this class, though not very numerous, the animals exhibited were of superior order. The first premium of ten sovereigns was awarded to Colonel Boyle, of Showelton, and the second of seven sovereigns to Mr. Hugh M'Jannet, in Drumshang. The others which were commended by the Judges as possessing merit, were a pair belonging to the Hon. Colonel Macadam Cathcart, of Craigengillan; and a dun-coloured ox, belonging to Mr. George Dunn, Blairston Mains, Ayrshire.

#### CROSS BREEDS.

In this class several premiums were offered for various crosses between the short-horn, Ayrshire, and Galloway breeds.

For the best ox, a cross between the Ayrshire and Galloway breeds, showing symmetry, fat, and weight, the premium of seven sovereigns was awarded to Mr. Andrew Hendrie, Highfield, Ayrshire.

For the best Ox, a cross between the short-horn and Ayrshire breeds, the premium of seven sovereigns was awarded to T. F. Kennedy, Esq., of Dunure. The ox, belonging to Mr. James Kennedy, senior, Lochlands, in the class, possessed much merit.

The premium of seven sovereigns for an ox, being a cross between the short-horn and Galloway breeds, was awarded to Mr. William Marshall, Kirkland, Kirkcudbright.

It may not be unworthy of remark, that in all cases of the crosses enumerated, the male seemed to have a preponderating influence in establishing the character of the progeny. For example, in the cross between the Ayrshire and Galloway, the Galloway bull had determined the character; in that between the short-horned and Ayrshire, the short-horn bull had decided the symmetry and points of the animals exhibited, although the character of colour, the breed having generally the same colour, could not be distinguished in the progeny; in that between the short-horn and the Galloway, the short-horn bull had decidedly imprinted its character on the animal exhibited.

In the class of oxen of any breed, the first premium was awarded to Mr. Hugh M'Jannet, Drumshang;

and the second to Mr. William Rodger, Dalmorton, Ayrshire.

## II.—HORSES.

In the class of Draught Stallions, eighteen competitors appeared. The premium of thirty sovereigns was adjudged to Mr. James Kirkwood, Gameshill, for his compact brown horse.

Of draught brood mares, none of them exhibited those superior properties for which the draught stock in the adjoining county of Lanark, has been so long celebrated. The first premium of ten sovereigns was adjudged to Mr. John Young, Nethertrees, Ayrshire; and the second of seven sovereigns to Mr. James Fulton, Bailig.

For the best Draught Gelding or Filly, the premium was awarded to Mr. Hugh Crawford, jun., Flat, Ayrshire.

In the class of Cleveland Stallions, the premium of twenty sovereigns was awarded to Mr. William Mure, Grange, Kirkcudbright.

## III.—SHEEP.

### *Black-faced Breed.*

In the class of black-faced Tups, the first and second premiums of five and three sovereigns, were awarded to Mr. Thomas Robertson, Broomlee, Peeblesshire; the premium of five sovereigns for the best pen of black-faced Ewes, was also awarded to Mr. Robertson.

In the class of black-faced Gimmers, the first and second premiums of five and three sovereigns, were awarded to Mr. Andrew Weir, Lindburn, Ayrshire.

In the class of black-faced Dimmots, the first premium of five sovereigns was awarded to Sir James Fergusson, of Kilkerran; and the second to Mr. Thomas Robertson, Broomlee.

In the class of black-faced Wedders not under one year and eight months, and not exceeding three years old, the premium of Mr. William Rodger, Dalmorton; for Wedders not exceeding three years old fed on hill pasture, the premium of five sovereigns, was awarded to Mr. Limond, of Dalblair, Ayrshire.

In the class of fat black-faced Wedders of any age, the premium of five sovereigns was awarded to Mr. David Tennant, Hawkhill Ayrshire.

### *Cheviot Breed.*

In the class of sheep of the cheviot breed, the premium of five sovereigns was awarded to Mr. Thomas Little, Pennyland, Dumfriesshire, for the best two tups, as was also the premium of five sovereigns for the best pen of ewes of the same breed. To Mr. Little was also awarded the premium of five sovereigns, for the best pen of cheviot gimmers.

### *Leicester Breed.*

In the class of tups of the Leicester breed, the premium of five sovereigns, was awarded to Mr. William Mure, Grange, and the Judges commended another tup of Mr. Mure's as deserving of notice.

For Leicester ewes the premium of five sovereigns was awarded to the Hon. F. Macadam Cathcart; and those belonging to Mr. William Marshall, Kirkland, Kirkcudbright, were noticed by the Judges as possessing merit.

## IV.—SWINE.

In the class of swine, the competition was pretty extensive. For boars, the first premium of five sovereigns, was awarded to Mr. John Dunlop, Auchans; and the second of three sovereigns, to Mr. John Howat, Martnaham, Ayrshire. For sows the first premium of five sovereigns was awarded to Messrs. Watson and Grieve, Whitehill, Ayrshire; and the second of three sovereigns to T. F. Kennedy, Esq., of Dunure.

In the class of sows the property of cottars or tenants paying not more than 15*l*. of yearly rent, the premium of three sovereigns was awarded to Mr. William Boyd, Ayr.

For pigs not exceeding forty weeks old, the first premium of five sovereigns was awarded to Mr. Andrew Dick, Genoch, Ayrshire, and the second to T. F. Kennedy, Esq., of Dunure.

The sow belonging to Mr. Breakenridge, Barbuston, was favourably noticed by the Judges.

## EXTRA STOCK.

As usual at all the annual shows of the society a con-

siderable number of animals out of the range of competition were, for various causes, exhibited as extra stock. They consisted of bulls, cows, heifers, oxen, crosses, horses, sheep, fowls, &c. &c.—The Judges particularly recommended the following among the extra stock as deserving of premiums, viz.—A set of four Ayrshire cows, exhibited by Mr. Finlay, Lyonsstone; Ayrshire cows shown by Mr. Bruce, Langholm; Ayrshire cows shown by Mr. Kirkwood, High Langmuir; an ox, a cross between a short-horn and Galloway breed, exhibited by Mr. Rodger, Craig; another, a cross between the Ayrshire and Galloway breeds, shown by Mr. Wright, Woodlands; a stot from St. Kilda, fed by the Hon. F. Macadam Cathcart; a heifer and stirk, crosses between the short-horn and Ayrshire, shown by Sir James Fergusson, of Kilkerran, Bart.; two tups exhibited by Mr. Garrat, Northamptonshire; ten black-faced tup lambs, shown by Mr. Andrew Weir; ten black-faced ewe lambs, exhibited by Mr. Thomas Fergusson, Dinmuirchic; a remarkably fine draught foal, shown by Mr. James Meikle, Clockston, Ayrshire. The large poultry, belonging to T. F. Kennedy, Esq., of Dunure, seemed to excite a considerable degree of interest.

## IMPLEMENTS.

In the class of implements the Judges examined every article exhibited with care, some of which are deserving of particular notice, for their ingenuity and aptitude to the respective uses, and workmanship, which last particular reflects great credit on the artisans of the county. Of those articles which the Judges think worthy of recommending, the reaping machine, exhibited by Mr. Smith, of Deanston, claims the first prize for the decided improvement he has effected in its principle of action, and for the substantial manner in which it is constructed. He also exhibited several models of drains. Mr. John Cook deserves commendation for good workmanship on his three-horse, and two-horse subsoil ploughs; also Mr. James McConnel for a subsoil plough and root slicer. Mr. Alexander Reid, of Bollingshaw, exhibited a method of equalising the draught of horses in thrashing machines, gins, &c.; an improvement in converting the common plough into a draining or trenching plough, several new methods of yoking horses in the plough, and cart, whereby two or more horses are made to pull equally and together; a simple method of making carts accommodate themselves to equalise the pressure on the horse's back in ascending and descending inclinations of road; a very ingenious method of adjusting cart axles to dished wheels without any set or bend; and a very simple and cheap stomach pump for cattle. Mr. Alex. Boyd exhibited a very ingenious self-acting tide gauge, and harbour telegraph. Mr. Robert Kerr, Stewarton, an elegant, useful and economical bee hive. Mr. John Underwood, Ayr, a very ingenious double-action pump. Dr. Sloan, of Kilmaurs, a safety traverse joint for carriages, whereby obstacles on roads may be passed over without risk of upsetting. Mr. Thomas McCririck, smith, Garrallan, by Cumnock, an improved cheese press, and an instrument to determine the set of coach and cart axles. Mr. John Watson, Ayr, an ingenious model of a safety lock involving a new principle. The number of subsoil ploughs exhibited formed a very interesting feature, as it evinces the extension of the use of that important improvement. There was a subsoil plough of a lighter construction sent from Stirlingshire by Mr. Murray, of Polmaise, which was said to be of easy draught for two horses at a depth of fourteen inches. The exhibition of drain tiles was also very encouraging, as showing the extension of that first of improvements—thorough draining. It is believed that a great waste of capital is too generally incurred by the use of inferior tiles; some tiles manufactured in Warwickshire, with models of the tools used in making them, were exhibited by Mr. Hamilton, Rozelle, which was highly approved of by the Judges. These tiles are more uniform in shape and burning than those generally in use in this country; and being stronger at the crown, and the edgings made broader than the general body, to give a broader bearing on the ground, and which forms are accomplished in the making by a very simple process. Mr. Robert

Boyle, potter, Ayr, also exhibited some good specimens of draining tiles.

#### V. ROOTS AND SEEDS.

The exhibition of roots and seeds was particularly enhanced by the well arranged collection of Messrs. P. Lawson and Son, the indefatigable Seedsmen to the society. Their collection consisted of 100 varieties of the cereal grains; 50 of the leguminous; upwards of 200 of the plants cultivated for their herbage, and 160 named varieties of the potatoe. It would perhaps be unnecessary to enumerate all the varieties of plants and other articles which were exhibited in this class, but a few remarkable articles may deserve some attention. From Auchincruive was exhibited Chevalier barley weighing 57½ lbs per bushel. A barley under the name of Pomeranian, which is a variety of the hordeum hexatemon. A barley from the Alps, a variety of distecheon. Specimens of Italian and Common Ryegrass in hay from Mr. Girdwood, manager at Kerrylamont the home farm of the Marquis of Bute, showing the comparatively great produce of the former. A fine sample of black oats imported from America by the late Earl of Cassillis in 1828, very productive of corn and straw, giving from twelve to sixteen bolls per acre, and not liable to shake out with the wind. This is probably a variety of the *avena ori entalis*. A very fine sample and in the ear, of black barley from the Cape of Good Hope, exhibited by Mr. Patrick McKinn. Gowkscroft. This is a variety of the distecheon, but a different one from any that had ever come under the notice of the Judges. A sheaf of very fine barley and a bushel sample of the same, under name of the Italian. It is a variety of distecheon, and resembling that known by the name of the golden. This was exhibited by Mr. Imrie, seedsmen. Messrs. J. Smith and Son, Ayr, exhibited the seed and plant of a new species of *Heraclium*, from Siberia, which for its large leaves and rapid growth, they consider suitable to the feeding of dairy cows. Messrs. Lawson and Son, exhibited the *Pinus Austriaca*, a plant superior to the *Pinus Sylvestris*, or *Laricio* in quickness of growth and durability of timber. Also plants of the *Pinus Sylvestris*, from Haganoe in Germany, presenting a more rapid growth than the plant produced from the native *sylvestris* of this country. They had also twelve varieties of flax raised from seed procured from Russia last year. That variety called *utissimum altissimum*, appears to possess superior properties, *Vicia villosa*, an annual growing seven feet in height; and the *biennis* are worthy of experiment.

For specimens of honey in the comb, in Kerrs, were exhibited by Miss Margaret Henderson, Thornhill, Mr. John Brown, Mr. Alexander King, and Mr. Robert Kerr, all from Stewarton.

#### WOOL.

There were only two competitors for cheviot wool. Premiums were awarded to Mr. Andrew Mitchell, senior, Linfairn; and to Mr. Peter Mitchell, Balloch Beatties, Ayrshire.

A premium was awarded to Mr. Thomas Wilson, Altonalbany, Barr, Ayrshire, for the best lot of black-faced wool.

#### WOOLLEN AND LINEN MANUFACTURES.

This exhibition consisted of carpets, rugs, flannels, damask and table linen; a certain sum was recommended by the Judges to be given to some of the competitors.

#### CHEESES.

In this class of articles there was a general and keen competition, not fewer than forty-three competitors having appeared in the lists. The Judges expressed themselves highly gratified at the superior quality of all the kinds of cheese exhibited.

The first premium was awarded to Mr. David Dickie, Tannierich; and the second to James Wright in Millhouse, parish of Symington, for full milk cheeses.

In this class the premium was awarded to Mr. Hugh Boreland, Wester Hillhouse.

The premium for imitation Stilton was awarded to Mr. John Dickie, Middle Robertsonland.

Mr. Murray, of Polmaise, sent a cheese for exhibition, which had been pressed by Mr. Robison's air pump press.

#### ON WORKING OXEN.

The following remarks on working Oxen are copied from the memoirs of the Pennsylvania Agricultural Society, contained in a letter from the Hon. Levi Lincoln, to John Hoare Powel, Esq.

The best broken Oxen are those which are early trained and accustomed to the yoke with occasional light work. They are often broken as early as at one or two years of age, with gentle and patient usage. At this period they are more docile and tractable, and it is thought become more powerful, by being sooner accustomed to each other, and to the application of their strength to the draft. I believe they may be taught to travel in almost any gait; certain it is, the rate at which oxen differently broken, will walk with their load would seem incredible to a person ignorant of the difference in the mode of their training. To accustom them to a quick pace, they should at first be driven in the yoke while young, without any, or a very light weight, and never heavily loaded, until they have arrived at full strength and maturity. A great fault with many people is too much indifference as to the construction of the yoke. Almost any shapeless piece of wood, with holes for the insertion of the bows, is made to answer; but to the ease of the draft, the adaption of the yoke or bow to the neck of the Bullock, and the position of the staple and ring in the yoke, are altogether material. For common use, and particularly for ploughing, I have found that yokes were generally too short. Cattle of the largest size, require a yoke from 4½ to 5 feet in length. In short yokes that are apt to haul as it is termed,—that is, draw from each other, to such a degree in some instances, as to cross their fore legs, and destroy their power, and greatly impede their progress. I once owned a pair made totally useless by this habit, and afterwards entirely corrected, by the application of a yoke 18 inches longer. A short yoke is necessary only in snow paths, where cattle would otherwise crowd against each other, the opposite of hawlings, but of the same mischievous effect. In respect to what oxen may be made to do in a short time, or as an experiment upon their strength, I must refer you to the results of our ploughing matches. With us they are but little used upon the road, except in the transport of heavy loads for short distances, in the same town or between neighbouring towns. One reason why horses are preferred for waggoning on the road, may be that they can be made to travel quicker, and that from the construction of the hoof they are less liable to lameness than the cloven-footed ox, by becoming foot-sore. On the other hand, the patient and steady labour of the ox, finds no substitute in the horse for the service of the farm, and the latter is seldom seen there except in occasional aid of the ox team, or with the light plough between the rows of corn. The value of a yoke of oxen, or a pair of horses, for use in all the business of a farm, admits of no comparison. So decided is the preference for the former, that I do not believe a single farmer can be found in this extensive Agricultural County who performs his labour by horses without oxen; while there are hundreds, I had almost said thousands, who make no other use of horses in husbandry, than to furrow for planting, and plough among their corn for hoeing. Our oxen are kept in a cheaper and less expensive manner than horses. In the summer, they are uniformly grazed in the pastures. In the cold and winter seasons they are put into the barns, and fed upon the stock hay, as it is called, that which grows in meadows, and upon the fodder of corn stalks, husks, &c. unless indeed they

are more severely worked than usual, when hay of better quality is given them; and in all cases, as the spring advances, their keeping is improved, and with better hay, some grain is added. I speak of the general practice of farmers. There are some who keep their oxen more generously, and others more hardly than I have mentioned. But with a clean and warm stable, with daily application of the curry-comb and card, and coarse food, without severe labour, the best farmers will at all times exhibit teams of most vigorous and powerful cattle, and the best hay and the grain will be saved in their beef and pork, and in the produce of their dairies, for the market.

## SONG FOR THE SPORTING SEASON.

I was a sporting character,  
And mingled with the gay,  
I used to hunt—but now those joys  
From me are *chased* away;  
Though left and right, to ev'ry flight,  
I went with Ward and Spring,  
I knew not till I took a wife  
The *secrets* of the ring,

I used to gamble—but alas!  
Those gambols all are o'er;  
My notes are changed to humble peace,  
And I can play no more!  
I used to press each friend to chess,  
Away from worldly strife;  
Was fond of draughts, which is, I find,  
A failing in my wife.

Our pleasures quickly pass away,  
'Tis useless for them wishing,  
I've but one hobby left, for now  
My sole delights in fishing;  
I have been baited by a maid  
(*'Twas scaly conduct—very!*)  
To quit the place at Pond-ers end,  
And take her to Fins-bury.

'Twas two o'clock one chilly morn,  
On Waltonising bent,  
That like two angry schoolmasters  
With rod in hand we went;  
We sneaked away, ere break of day,  
Our sleeping spouses dishing,  
Not only fixed to fish in Kew,  
But in the cue for fishing.

The morn was heavy-wet, and hail  
In torrents like a sea,  
Rush'd down the streets—at Christmas time  
'Twould seasonably be;  
You'll ask—how can I prove the fact?  
Quite easily 'tis done—  
For London is at Christmas time,  
With currents over-run,

At length we reached the destin'd spot,  
The storm and rain abated,  
And being simple men of course,  
We both with *gentles* baited.  
Our sport that day—I grieve to say,  
Was worse than we expected;  
Like would be monthly scribblers, we  
Soon found our lines rejected.

*From the Lays for Light Hearts.*

A MOVING BOG.—This rather rare phenomenon has been lately witnessed on a part of Lord O'Neill's estate, in the neighbourhood of Randalstown, on the Ballymena road, and about two and a half miles from the former town. The following is the substance of a letter which we have received from a gentleman who was at the place on Saturday last:—On the 19th ult., in

the evening, the first movement occurred. A person who was near the ground was surprised to hear a sort of rumbling noise, as if under the earth; and, immediately after, his surprise was not a little increased, on perceiving a part of the bog move pretty rapidly forward, a distance of a few perches. It then halted, and exhibited a broken, rugged appearance, with a soft peaty substance boiling up through the chinks. It remained in this state till the 22d, when it suddenly moved forward, at a quick rate, covering corn-fields, potato-fields, turf-stacks, hay ricks, &c., not a vestige of which now remains to be seen. So sudden and rapid was this movement, that the adjacent mail coach road was covered, in a few minutes, or, rather, moments, to a depth of nearly twenty feet. It then directed its course towards the river Maine, which lay below it; and so great was its force, and such was the quantity of matter carried along, that the moving mass was forced a considerable way across the river. In consequence of the late heavy rains, the river has again found its channel through the matter deposited in its bed, otherwise the water would have been forced back, and immense damage done to the land on the banks. The fish in the river have been killed for a considerable distance. The damage done by the mossy inundation has been very considerable. About 150 acres of excellent arable land have been covered, and rendered totally useless. Down the middle of the projected matter a channel has been formed, through which there is a continual flow of dark peaty substance, over ground where only two weeks ago the reapers were at work. A house close by the road is so far overwhelmed, that only a part of the roof is to be seen. Besides the actual damage sustained, the utmost alarm prevails, and the people living adjacent to the place have been removing their furniture, &c. to a distance. All manner of absurd reasons are assigned to account for the destroying visitation; but as the cause is one of a natural and sufficiently well ascertained kind, it is useless to dwell upon the solutions suggested by ignorance.

IRON PLOUGH.—A gentleman, named Malabar, who has been for some time a resident here, has invented, and had constructed, under his immediate direction, a plough, composed principally of wrought iron, which, on trial, has been found infinitely superior to the Kentish plough, now in common use; and over which it possesses the important superiority of being easily worked by one man, with two horses. Mr. Malabar, whose object seems to be that of combining economy with utility, has entered into a calculation to show the advantages likely to be derived from his invention; and mentions instances where four men and eight horses are employed to perform the team work upon 150 acres of arable land, at an annual expense to the farmer of nearly 550*l.* Lands which now require two men and four horses, he observes, might be profitably tilled with half the number of each. The iron plough has been successfully worked at Kersney Court, and in the neighbourhood of Hougham; but we regret to add that the body of the machine was detached from the wheels, during the night of yesterday week, and clandestinely removed from a field near the last-named place, where it had been left, after the employment of the day; and all inquiries for its recovery have hitherto proved fruitless.—*Dover Telegraph.*

JOINT STOCK BANKS.—The aggregate amount of notes circulated in England and Wales by Private Banks and Joint Stock Banks, in the four quarters of the year ending 27th June, 1835, is as follows:—Quarter ending 27th Sept. 1834. Private Banks 8,370,423*l.*; Joint Stock Banks, 1,783,689*l.*; total 10,154,113. Quarter ending 28th December, 1834. Private, 8,537,655*l.*; Joint Stock, 2,122,173*l.*; total 10,659,828*l.* Quarter ending 28th March, 1835. Private 8,231,206*l.*; Joint Stock, 2,188,954*l.*; total 10,420,160*l.* Quarter ending 27th June, 8,455,114*l.*; Joint Stock, 2,484,687*l.*; total 10,939,801*l.*

## BRITISH AGRICULTURAL LOAN COMPANY.

TO THE EDITOR OF THE TIMES.

SIR,—Printed circulars are now being disseminated, announcing a project for establishing a British Agricultural Loan Society, the professed object of which is declared to be “to place agriculturists upon an equal footing with the trading community, by making them such advances upon corn as other trading companies do upon merchandise, so as to enable them to contend fairly for that reward of their labour which all other interests so strenuously maintain.” It is further stated that “the system to be adopted by this association is perfectly original, as this company will never work upon anything but real capital under trust, nor will it ever interfere with the regular business of any bank by the discount of bills but contrariwise create by its ordinary operations an increased demand for local notes, which must tend to employ the capital, confirm the credit, and promote greatly the future welfare of that interest especially.” And, again, the institution is said “to be the offspring of nature and of circumstances,” the meaning of which, I confess, I do not clearly comprehend; but, however much I, in common with many others, do lament the ruinous state of agriculture, I much fear that its regeneration must be effected by circumstances very different in their nature from any which can be inferred from the scheme held out in the prospectus of this natural and circumstantial association.

Any advance to be made by this company will, it is presumed, only be made on such corn as may be consigned to them and lodged in their granaries; and if they act prudently, such advance will not exceed two-thirds of the market value for the time being; now, I would beg leave to ask what advantage the farmer would derive from this beyond what he now enjoys, from consigning to the respectable factors in Mark-lane; besides, it must be evident, that in the early part of the corn season, (that is, between harvest and Christmas,) were they to thrash out their corn to a large extent, which in many instances would not only be impracticable but absolutely disadvantageous, the corn so thrashed, unless it were kiln-dried, would get out of condition, and must be deteriorated. And moreover, if heavy consignments were made, so as to influence the market and raise the prices, it would give the farmers possessing capital a decided advantage over those who were needy, because the former would immediately thrash corn from the stacks, which would be in much better condition than that in granary, and obtain a higher price at the expense of those very persons whose interests it is proposed to maintain.

Every one conversant with the corn trade knows that, on an average of years, and under ordinary circumstances, it is only by possessing large capital, and by purchasing even at less cost than that at which it can be produced, that the speculation will repay the purchasers, and although the loan company may indemnify themselves, still, if the expense of keeping, and the interest on money advanced, fall on the farmer who consigns, what possible advantage can he derive?

Anything in the shape of monopoly is at all times impolitic, and fraught with danger to the public; and in times like the present might cause such an excitement as would endanger the peace of the country as well as the interests of individuals.

As respects the boon which the scheme professes to hold out to bankers, I fear they will have some difficulty in discovering how it would operate in their

favour, because trade is, like water, sure to find its level, and must be seriously affected if any factitious or unnatural means are resorted to for the mere purpose of a seeming temporary expediency, and there is no axiom in philosophy more true than this, “that one extreme always produces another.”

On the whole, I am satisfied that the evil of which agriculturists complain lies too deep to be cured by any such palpable quackery as that now proposed, and as there is no want of capital in the kingdom, nor lack of energy and knowledge to wield it, it is quite certain that if individuals capable of forming a correct judgment considered it advantageous to speculate in corn under present circumstances, they would readily do so, and it is equally clear that if individuals cannot obtain a remuneration for their capital thus employed, neither can joint-stock associations such as this, unless it be at the expense of those very agriculturists whose interest they affect to espouse.

I am, Sir, your very obedient servant,  
Norwich, Oct. 13. THOMAS NIMMO.

## WALTHAM AGRICULTURAL ASSOCIATION.

At the first anniversary meeting of this society, which took place at Waltham on the 8th of October, the ploughing match was well attended, upon the health of the judges being drank after dinner, W. Beasley in returning thanks observed, that only a very few years ago he was almost ashamed to acknowledge where he came from, in consequence of the backwardness evinced by the Leicestershire farmers and graziers to form Agricultural Societies; but now he was pleased to say, that at this time there were three distinct and efficient societies in the county. He spoke at great length of the good likely to result from agriculturists forming themselves into societies, also of the excellent situation at Waltham; and said, he could not account for the rapid growth of the infant society, whose first anniversary this day had taken place, but from a conviction that farmers now begin to see as they ought to do, and he hoped they would go on progressing, and that they would all put their shoulder to the wheel, and each and every one of them in his respective station would interest himself in the promotion of such a laudable society. He also adverted to the necessity of all agriculturists having an eye to the proceedings of the next parliament from a feeling being thrown out by the commissioners' report in the Excise Inquiry, wherein they state that one-half of the duty on malt might come off, without great injury to the revenue, if the existing corn laws could be repealed or modified so as to allow of the importation of barley at a lower rate of duty! And should such an attempt be made, he hoped that every person connected with agriculture, would to a man use all lawful means to stop so destructive a measure for the British farmer. For as much as he (Mr. B.) would like to see the repeal of the malt duty, he would not like to see it purchased at the expense of the present existing corn laws.

THE MAMMOTH GOURD.—The largest we have heard of is now to be seen in the window of Messrs. W. and J. Noble, seedsmen, Fleet-street. It was raised in the garden of Thomas Creswick, Esq., Hatfield, Herts, weighed 148lbs when cut, and measures seven feet one inch round. It is a beautiful specimen of the *Cucurbita* tribe, and does great credit to the grower.

An extraordinary ox hide and horns has been landed in the St. Katharine's Dock from the ship *Vistula*, arrived from the Cape. The beast is supposed to have been about five years old. The circumference of the horns at the root is 17 inches; length of the horn four feet six inches; from tip to tip, in a straight line across, eight feet five inches; the front of the skull, 13 inches.

## FOREIGN CORN.

RETURN to an Order of the Honourable the House of Commons, dated 6th of August, 1835;—for an Account of the Total Quantity of Quarters of Foreign Wheat that have paid the Duty for Consumption in the United Kingdom, under 9 Geo. IV. c. 60, since that Act came into force, in 1828, till 5th of July, 1835, and the Total Amount of Duty received thereon; and showing, from the Total Quantity of Quarters, and the Total Amount of Duty so received thereon, what the Duty was equal to per Quarter on the Average for the whole Period;—and

The same Account for Foreign Barley, Oats, Rye, Peas, and Beans, Wheatmeal and Flour, Oatmeal, Maize or Indian Corn, Buckwheat, Bere or Bigg; and the same Account for all these, the Produce of, and imported from any British Possession in North America, or elsewhere out of Europe.

## FOREIGN CORN, MEAL, and FLOUR.

CORN, MEAL, and FLOUR, the produce of, and imported from, British Possessions out of Europe.

|                       | Quantities charged with Duty for Home Consumption under Act 9 Geo. IV. c. 60, from the passing of the Act (15th July, 1828) to the 5th July, 1835. |         |    |    | Quantities charged with Duty for Home Consumption under Act 9 Geo. WM. IRVING, Inspector.

General of Imports and Exports.

Inspector-General's Office, Custom-house,  
London, August 15, 1835.

## EPILEPSY IN CATTLE.

(From the Veterinarian.)

This sad malady is far more prevalent among oxen and steers, and sometimes among calves, than in the horse; and yet it has been observed that a milch cow is rarely or never affected by it. So much of the food of the cow being devoted to the nutriment of their offspring, or of man, we cannot well conceive of the possibility of that plethoric state or deranged circulation by which epilepsy is usually caused.

SYMPTOMS.—Young cattle are the usual victims here, as might be readily expected. The premonitory symptoms are as obscure as in the horse; or, perhaps, they are as deficient in cattle as in the horse. There will, perhaps, be a little previous dullness or heaviness, but that will rarely be observed, or it will be regarded as accidental, or connected with some other and different disease.

The beast begins all at once to stagger. He usually moans piteously, and, as the fit approaches, the moaning changes to a fearful bellowing. The convulsions are more diffused and more violent than in the horse—the dreadful labour of respiration, and the contraction of the abdominal muscles are frightful—the mouth is filled with frothy fluid, tinged with the colour of the food, and many particles of food mingling with it, and the fæces and the urine are discharged involuntarily.

The duration of the fit is uncertain; but, as in the horse, the convulsions gradually cease, and all is for a moment quiet—the beast gets up—looks around him with wonderment and suspicion—slowly and cautiously joins his companions, and then begins to graze again, as if nothing had occurred.

SERIOUS NATURE OF THE DISEASE.—The evil, however, does not end here. The young beast is a far more plethoric subject than the ox—the usual course of the blood is more easily deranged and determined to the brain, and the habit of fits is too readily formed; and not merely of fits occurring at irregular and distant intervals as in the horse, but twice or thrice, or many times in the course of a day: so that there is not only much danger to those who have to attend on the animal, but he is covered with contusions, his condition is impaired, and he is soon ready to be carried off by some more than usually violent attack.

There is an almost inseparable connexion between epilepsy and apoplexy in these animals. Young beasts in high condition are oftener attacked; and a sudden change of pasture from that which is scanty to another that possesses extraordinary luxuriance is almost sure to produce it. In fact, it is apoplexy or staggers in these animals.

There is, from determination of blood to the brain, sufficient pressure to produce great derangement in the stream of nervous influence; but not enough to be the immediate cause of death.

TREATMENT.—The mode of treatment will be same as in the horse—bleeding, physic, setons, and a less allowance of food: but, except there are circumstances which render the farmer peculiarly anxious to save that beast, the wisest course is to send him to the butcher, for the treatment will be both expensive and doubtful.

SHEEP.—This disease occurs yet oftener in sheep than in cattle. On a sudden, and without any apparent cause, a sheep will cease to graze; he will stare stupidly around him, stagger, run round three or four times, and then fall and struggle violently for several minutes. By degrees the convulsions subside, they cease, and the animal gets up with the same half-unconsciousness that has been described in the horse and the ox; this wears away, and he begins to graze again.

NATURE OF THE DISEASE.—Here again is a close connexion or identity between apoplexy and epilepsy. These fits oftener occur in young sheep in good condition, and after improvident change of pasture. It is very frequent in the beginning of spring and the latter part of autumn, when the hoar frost lies thick upon the ground. The sheep, either not having been folded, or being turned out too early, gather much of this congealed water with their food; and it palsies the action of the rumen, or by its intense cold determines the blood from it to a more important and dangerous part. Having to travel over the Downs of Wiltshire at this season, a few years ago, I had an instructive but not pleasing illustration of this cause of epilepsy. Within two hours after day-

break I saw at least twenty sheep and lambs with the convulsions of epilepsy strong upon them. The coachman told me that on every fine cold morning he saw nearly or quite as many. I saw also an illustration of the chief method of cure among some of the shepherds. It was to break one morbid derangement of the nervous system by setting up another. The dog was set upon the poor animals, and who were thus speedily frightened, not out of their senses, but into them again. I saw this succeed in several instances; but I thought that it was a brutal and a dangerous mode of cure. The chain of diseased action might sometimes be broken, but there was hazard of the determination of blood to the sensorium, which was the cause of these convulsions, being abundantly and fatally increased. I thought it would have been better to have soothed the poor animal, and to have taken it home and nursed it, and, most of all, not to have exposed it to the influence of this cause of derangement of the vital and nervous currents.

**FREQUENCY OF IT IN SOME DISTRICTS.**—On some parts of the continent this disease is very prevalent and fatal among sheep, and is traced to the nature of the pasturage. Tessier, in his valuable work on sheep, speaks of it as having been lately introduced, and becoming exceedingly prevalent and fatal in the district of Beauce, in France. When it once attacks a flock, it finds such a free disposition in them all to be affected by it that the farmer either gets rid of the whole, or destroys every sheep that exhibits the slightest symptoms of it; and many of the farmers of the district have actually given up sheep husbandry on account of the frequent prevalence and the ravages of this malady. He attributes the complaint to the cultivation of a different kind of pasturage in Beauce than that on which the sheep used to feed; but he does not enter into the particulars which we could wish on such a point.

Gaspain, speaking of its prevalence in Germany, says, that it is most destructive in the spring and the summer, and occasionally so in the winter; and he tells us that the shepherds there attribute it to the feeding on some species of dock, and garlick, and, in the winter, on the sproutings of the pine.

There can be no doubt that pasturage and condition are main agents in the production of this disease.

## ON THE APPLICATION OF THE POINTS BY WHICH LIVE-STOCK ARE JUDGED, TO SHORT-HORNS.

By MR. JAMES DICKSON, CATTLE-DEALER,  
EDINBURGH.

(From the *Quarterly Journal of Agriculture*.)

(Concluded from page 249.)

I have said that the origin of the short-horn cattle, like all other existing breeds of cattle in this country, is but obscurely known; that is, in other words, the origin of that breed which imparted the external characters and useful properties of the short-horns, is but obscurely known; but the period at which that breed began to acquire the refined tone, or "blood," which now characterizes its useful properties, is not enveloped in obscurity. Historians trace the type in this manner: A race of cattle had long existed on the banks of the Tees, in the counties of Durham and York. Whence or how they came is not known.

They acquired the appropriate title of Teeswater cattle. Many years ago this breed existed in considerable numbers; the following description of which is given by the Rev. Henry Berry, in his *Account of the Improved Short-horns*, p. 13, 14.

"In colour resembling what is called the improved breed of the present day, except that the fashionable roan was not quite so prevalent; they are described in general characters also to have differed very little from their descendants. Possessing a fine mellow touch, good hair, light offal, particularly wide carcasses, and deep-fur quarters; they were also justly celebrated for extraordinary proof when slaughtered,—resembling thus closely their descendants of the present day. One trifling difference is alone worth recording,—the horns of the old Teeswater breed were rather longer, and turned gaily upwards."

The Teeswater breed thus formed the foundation on which the present superstructure of the improved short-horns have been reared. The connecting link, however, betwixt the old and new breeds cannot now be very distinctly traced, the history of that connexion being very unsatisfactory. Whether any attempts had been made to improve the Teeswater breed itself is not known. Every authority on this subject seems to agree, that the first probable attempt to improve them was by crossing with a breed imported from Holland, which was similar to that now in Holstein. Certain it is that the present Dutch and Holstein breeds of cattle present a frame not unlike that of the improved short-horns, and superior to that of the Teeswater, though in *points* they are inferior to the former. The colours of the Dutch are black and white, while those of the Teeswater were red and white. The numerical superiority of the latter breed may have obliterated the black colour of the former; but it is not improbable, that the black of the imported breed had rendered the red of the Teeswater darker and richer. The red colour of any unimproved breed of cattle that I have seen, is generally of a yellowish hue than the rich red of the improved short-horns. These remarks on the colour of cattle are by no means whimsical, for colour is a permanent character, and the uniform intensity of colour, of whatever tint, is strongly indicative of purity of blood. Short-horns only sport two colours, a rich red and a cream white. These may be exhibited singly, or they may be patched together, or blended hair about. The presence of any other colour should be viewed with great suspicion.

Amongst the earliest importers of Dutch bulls and cows was Sir William St. Quintin of Scampston. The cross produced by the imported breed is said to have made a decided improvement on the old; and following up the advantage, the cross at length produced a stock distinguished by the name of the "Teeswater Short-horns," a stock which united in a wonderful degree the good properties of graziers and milkers. These valuable properties were soon appreciated, and cherished with uncommon zeal among rival breeders. Mr. Milbank of Barningham was one of the most successful of these breeders. He flourished about ninety years ago.

No pedigrees of cattle having been kept at that early period of their history, no satisfactory account of them can be given till the appearance of the bull Studley, of a red and white colour, bred by Mr. Sharter of Chilton. How he was directly descended I cannot ascertain; but there is little doubt of his being the result of the cross, though

not an immediate one, between the old Teeswater and Dutch breeds. It is probable that Mr. Sharter may have obtained the dam or sire of Studley from Mr. Milbank, for he was in the practice of purchasing stock from the latter gentleman, who was particularly fortunate in his stock of cattle. A cow which was bred from Mr. Milbank's stock by Mr. Sharter was slaughtered, after bearing several calves, and weighed in the four quarters upwards of 110 stones. And to show the successful completion of Mr. Milbank's improvements in his own days, an ox, five years old, was slaughtered by him, and the four quarters weighed 150 stones. The Studley bull, then, may be regarded as the first recorded progenitor of the present race of improved short-horns. He is described "as having possessed great girth, deep fore-quarters, short legs, neat form, and light offal." His pedigree, however, is not traced in Coate's Herd Book. The Studley bull, red and white, got James's Masterman's bull, which was bred by Mr. Walker, near Leyburn. 'Masterman's bull, colour not known, got William Robson's bull, which was bred by Mr. Waistell of Great Burdon, near Darlington, and whose dam was Mr. Waistell's roan cow Barforth. Robson's bull, colour unknown, got Snowdon's bull. Mr. George Snowdon of Hurworth, received a present of six cows and a bull from his landlord Sir James Pennyman, who obtained his stock from Sir William St. Quintin of Scampston; but whether the present given to Mr. Snowdon by his landlord, consisted of the Dutch breed as imported by Sir William St. Quintin, or the improved cross with the old Teeswater, appears to me uncertain. Be that as it may, Snowdon's bull got the famed bull Hubback, colour yellow-red and white, bred by Mr. John Hunter of Hurworth, and calved in 1777. Hubback's dam was also bred by Mr. Hunter, and she was got by a bull of Mr. Banks of Hurworth; and his grand-dam was bought from Mr. Stephenson of Ketton. It was at one time asserted that Hubback's dam was descended from a Kyoel, but there is every reason to believe, from the testimony of people who knew Mr. Hunter's stock, that she was descended from the stock imported from Holland. Hubback, when a calf, was about to be purchased by Mr. Waistell, who refused to give the money sought for him, namely, 8*l*. Mr. Waistell asked the opinion of Mr. Robert Collings of Hubback, who expressed it in a manner which induced Mr. Waistell to close the bargain. Mr. Robert Collings also desired to purchase the young bull, so that both these gentlemen made a joint speculation of him. Both parties not being overjoyed with their purchase, sold him to Mr. Charles Collings of Barmpton, near Darlington, who soon saw the value of the little animal. For quality of flesh, hide, and hair, young Hubback could not be surpassed. Hubback's mother, when removed to good pasture, got so fat as to be unable to bread, and Hubback himself soon became useless as a bull; but so long as he could be used, he proved himself a sure stock getter. Mr. Waistell repented of selling Hubback to Mr. Charles Collings, for "when he began to cover, Mr. Charles Collings confined him to his own stock, and would not let him serve even one of Mr. Waistell's cows."\*

Beyond this period it is quite unnecessary to trace the pedigree of short-horns. "It has been remarked," says a writer, "that we have at present no superior horse on the turf, which does not boast the blood of the Godolphin Arabian" (by-

the-by the Godolphin was not an Arabian, as is commonly stated, but a Barb), "so it may be asserted that we have no superior short-horns which do not claim descent nearly or remotely from Hubback." Foljambe's dam was got by Hubback. Foljambe, white and a few red spots, calved in 1787, was the bull Mr. Charles Collings considered did the greatest good to his stock; and in him were the Barningham and Hubback bloods united. Mr. Charles Collings, by great judgment and perseverance, brought the short-horns to the greatest degree of perfection. It is rare that a man enjoys the fruits of his own labours, in a business which, in a great measure, he had created for himself, and which requires the greater part of a lifetime to bring to maturity; but in Mr. Charles Collings's case, it may be said, he was amply rewarded for his attention to breeding. His brother Robert went hand in hand with him, and participated in his success.

Take the following as an instance of their success. According to Mr. Bailey's Survey of Durham, Mr. Charles Collings's stock realized the following prices on 11th October 1810:—

|                  |               |               |              |
|------------------|---------------|---------------|--------------|
| 17 cows,         | for £2802 9 0 | highest price | 410 guineas. |
| 11 bulls,        | .. 2361 9 0   | .....         | 1000 ....    |
| 7 bull calves,   | 687 15 0      | .....         | 170 ....     |

47 head sold for £7115 17 0

At that sale was sold the bull Comet, calved in 1804, and died in 1815, to Messrs Wootend, Trotter, Wright, and Charge, near Darlington, for 1000 guineas, and it is said that 1600 guineas were offered for him afterwards.

On the 29th of September 1818, Mr. Robert Collings's stock was sold off at the following prices:—

|                |                   |               |              |

61 head sold for 7484 guineas.

Till within the last thirty years, few short-horns were seen north of the Tweed; but now, the counties of Berwick, Roxburgh, and the northern portion of Northumberland, can exhibit as numerous and high bred stock as the counties of Durham and York. Amongst the breeders of short-horns in Scotland, the late Mr. Robertson of Ladykirk, near Coldstream, stood pre-eminent. Mr. Robertson spared neither trouble nor expense in procuring the best bulls from the most eminent breeders in England. His judgment of good stock was very acute. He furnished accommodation to stock, both in regard to housing and pasturage, of the first order. It was a delightful sight to contemplate his stock of cows, forty in number, grazing in the luxuriant old pastures around Ladykirk House. I have seen the grass as high as their fetlocks by the middle of April. It was also delightful to see the feeding stock in winter, in small comfortable hermsels, bedded plentifully with straw, and supplied with abundance of turnips. During the early period of his exertion in breeding stock, Mr. Robertson was averse to strangers inspecting his premises, and few breeders were permitted to send cows to Ladykirk. Latterly, however, when the stock was as highly bred as any as could be obtained from England, he was more liberal in the disposal and use of his stock. His bulls Signor, Sirius, white, Sultan, roan, Young

\* British Cattle, p. 229.

Sultan, Valentine, red, Romulus, white, which all proved themselves excellent stock getters, will not soon be forgotten. During the last few years of his life, Mr. Robertson evidently relaxed in his exertions to preserve his stock in the highest perfection. They shewed evident symptoms of too close breeding; they became tender, and wanted size; and accordingly at the sale at Ladykirk after his death, the breeding stock did not realize the prices they were entitled to according to the breeder's fame. The Messrs Comptons of Carham, in Northumberland, became eminent breeders. At the sale at Carham, some of the bulls fetched upwards of 100*l*, and the cows 60*l*. Mr. Thomas Smith of Grindon, also in Northumberland, some years ago possessed a very superior stock. His stock was generally of a larger bone than Mr. Robertson's, carried great weights, and were very hardy in constitution. Mr. Smith's heifers were eagerly sought after by breeders. His bull Duke, and some others which were never named, left much good stock. Of late years Mr. Smith has declined the trouble of an active breeder. His brother, Mr. William Smith of Shedlaw, possessed an equally good and similar sort of stock. The stock of the Messrs Smith was mostly red and white, while that of Mr. Robertson were mostly white and roan. Still keeping on the south side of the Tweed, Mr. Alexander Thompson of Scramernston and Learmonth has bred many superior bulls, such as young Lancaster, Larmonth, Midas, Mindurum, North Star. Mr. John Grey, Milfield Hill, near Wooler, has a large breeding stock. The bull Fitz-Duke was bred by him. Mr. William Jobson, Chillingham-Newton; Mr. Robert Jobson at Turvelaws; Mr. Hunt at Thornton; Mr. Alder at Hazlerigg; Mr. Curried who was at Brandon; Mr. Culley of Akel, who soon declined farming, but whose stock fetched a large sum; Mr. Culley of Fowbray; and Mr. James Chrisp at Doddington, are all eminent breeders; and the blood of their stock is so pure, that a breeder desirous of obtaining a good stock to commence with, or of crossing for improvement of what he may at present possess, cannot err in selecting from any of them.

On the north of the Tweed Mr. Robertson of Ladykirk took the lead as a breeder of short-horns. His stock was neat and compact, and possessed properties very similar to that of Mr. Charles Collings. No farmer could well compete with Mr. Robertson, for no farmer had the fine old pasture and accommodation equal to the lawn and steading of Ladykirk. It was pleasing to observe a large landed proprietor devoting these favourable advantages, and his time and talents, to the cultivation of stock. Mr. John Heriot of Ladykirk farm being near to, and on intimate terms with, his landlord Mr. Robertson, possesses the same stock. The late Mr. Abraham Wilson of Edington Mains, near Dunse, had a fine and large breeding stock; he and three other gentlemen hired the bull Diamond from Mr. Charles Collings, which obtained at the time the first premium at the show of the Tweedside Agricultural Association. His late brother Mr. James Wilson, and his nephew Mr. John Wilson, at present at Simprim, near Coldstream, possessed fine useful breeding stock. Few better stock could be seen anywhere than at Whitsome Hill, near Dunse, when the late Mr. George Brown had that farm. In his stock was united the Grindon and Ladykirk bloods. He bought heifers from Mr. Smith, which were served with Mr. Robertson's bulls; a privilege which none but Mr. Heriot possessed, beside Mr. Brown. Mr. Robertson

was so pleased to observe Mr. Brown's superior farming, that he offered him gratuitously the service of his best bulls. Mr. Jopling of Castletlaw, near Coldstream, has a fine breeding stock. The late Mr. Hogarth of Bailieknow, near Kelso, was long an eminent breeder, and purchased some of Mr. Robertson's best bulls. The short-horns have so spread over the Border counties of Scotland, that every farmer, how small soever his possession, has now stock of a superior order. The show of the very superior stock at the Highland Society's show at Kelso in 1832, demonstrated in a decisive manner the superior quality of this species of stock in the Borders.

In East Lothian, which is not a breeding county, the Marquis of Tweeddale, at Yester, and Mr. Bogue of Limplum, have devoted much attention to the breeding of short-horns. But the most enterprising breeder in this county was Mr. John Rennie, when at Linton. He did more than any other person to spread fine stock throughout Scotland. He purchased all the finest breeding and feeding stock he could find, and disposed of them every year, by public auction, at Phantassie. At these sales, 22,000*l*. have been received in one day. He purchased largely from the stocks of Mr. Robertson and Mr. Mason of Chilton. His very superb lot of breeding cows, as they grazed in the fine grass park in front of Phantassie House, was the admiration of every one who passed that way.

The Duke of Buccleugh has a superior stock at Dalkeith Palace. His Grace purchases the finest heifers and bulls that can be had in England, his principal object being to stimulate his tenantry to the like exertion.

In Fife General Simson led the way. He obtained most of his stock from the Messrs. Collings, and although they were all sold off at the General's death, they remain in the county to disseminate the breed. Mr. Boswell of Balmuto bestowed great attention to breeding short-horns. Part of his stock was obtained from Northumberland. Having removed from Balmuto to Kingcausie, near Aberdeen, he there pursues the crossing system with the short-horn bull and Aberdeenshire cow. Mr. Thomson of Pusk, and Mr. Dudgeon of Falkland Wood, with some others, have tried the short-horns; but this breed, though well adapted to Fife, is not so widely dispersed in it as they deserve, much to the loss of the farmers themselves.

Mr. Mowbray of Cambus, a distiller in Clackmannanshire, is a very spirited breeder of short-horns, and makes every exertion to spread the breed through the country. He showed some superior stock at the Highland Society's Show at Stirling in 1833. Mr. Ritchie of Newhouse, near Alloa, purchased the white bull Romulus, bred by Mr. Robertson, from Mr. Rennie, and which obtained the first premium, in 1827, at one of the Highland Society's Shows at Edinburgh. Mr. Aitchison, of St. Clement's Wells, another distiller, purchased some good animals from Mr. Rennie's stock.

The short-horns are pushing their way through Perthshire; Mr. Richmond of Monedie has shown some good specimens of them. Lord Kinnaird at Rossie Priory has purchased bulls from the present Earl Spencer for the use of his tenants. Mr. James Hunter of Monorgan, in the Carse of Gowrie, has paid considerable attention to the breed; and, not far from him, Mr. Patrick Kinnear of Lochton and Littleton has shown good

specimens of stock. These gentlemen, and Mr. Hunter of Glencarse, purchased the red and white bull Linton from Mr. Rennie.

In Forfarshire the short-horns first took footing near Coupar-Angus. Mr. David Inches of Cardean has shown many excellent specimens. He derived his stock from the Messrs Wilson of Edington Mains and Simprim, in Berwickshire. Mr. Andrew Dalgairns of Ingliston, a very extensive feeder, has now got a considerable number of them; and so have his neighbours Mr. Anderson of Newton and Mr. Hood of Hatton. Mr. Stephens late of Balmadies was among the first to introduce short-horns in the eastern district of Forfarshire. His stock was obtained from Mr. Brown of Whitesome Hill, in Berwickshire; and his red and white bull, named Brown in honour of the breeder, was admired by every one who saw him, having proved himself for eight years an excellent and sure stock getter. He was got by Mr. Robertson's red and white bull Valentine, out of a cow descended from the stock of Mr. Mason of Chilton, and crossed with the stock of Mr. Smith of Grindon. At the sale of Mr. Stephens' stock in 1830, Mr. Rennie of Kinblethmont Farm, Mr. Hood of Hatton, Mr. Cobb of Mains, were purchasers as breeders. Mr. James Rennie of Kinblethmont Farm, near Arbroath, followed Mr. Stephens' example, and has now a large breeding stock. Mr. William Mustard of Fithies, who is a famous breeder of Angus cattle, also tried the short-horns, as well as his brother Mr. James Mustard of Leuchlands, near Brechin. The late Mr. Arkley of Dunninald, near Montrose, had also a large breeding stock of short-horns at an early date. He obtained them principally from Mr. Mason of Chilton. The stock was sold after his death and distributed through the county. Mr. William Cobb of Mains, near Dundee, has some good short-horns; and the late Mr. Anderson of Carlungie, near Arbroath, possessed some good stock.
